Abstract

The world experience of economic development shows that global changes took place in the sphere of education, including Business English. Business English has an important role in our life and is a key to the world of Business. English is the world's leading language studied mostly as a foreign language around the world. Researchers have been investigating how Business English is learned looking from different angles within the framework of ESP (English for Specific Purposes). It is vital to understand the essence and role of ESP and Business English. It is obvious that many institutions offer special courses to the people who are young in order to improve their skills. More active actions and multidisciplinary approaches in the same field will definitely lead to the new findings. Globalization will continue to fulfill new requirements and promote Business English.

Keywords: Business English, English for Specific Purposes, Business communication, Business correspondence.

Introduction

Business English and business communication are relatively new areas of study for the Azerbaijani learners of English. Business English and business communication have become vast subjects for students, economists, businessmen and teachers of English over the past 28 years with the transition to market economy, as the Republic of Azerbaijan became independent in 1991. Our Republic is rapidly developing and the relevant orders have been issued for the improvement of teaching of foreign languages in the higher education institutions, including the Azerbaijan State University of Economics (UNEC). Dual diplomas, student-teacher exchanges, organization of scientific seminars in English, holding international conferences and the steps taken recently by UNEC have created an incentive for the English language among students and faculty members (university collaborators). The English language teaching process is one of the priorities not only at UNEC, but also at the other Azerbaijani universities and institutions and every study on elimination of its teaching problems is urgent and should be evaluated positively.

Method

Using the qualitative research methods, teaching business English for special purposes was analyzed and developed in various directions. To form students' lexical skills necessary for foreign language professional communication in the field of economics. Business English teaching focuses on developing both the language and the style of typical business skills, acquainting the reader with the concept of “vocabulary of professional communication”; determining the essence and structure of terminological vocabulary; identifying the differences between "terms" and "professionalisms".

Communication is our lifeblood, and it's the lifeblood of any organisation. Excellent communication skills are probably the most important career and personal skills you can possess. But people aren't just 'born' writers or speakers. The more you write and the more you speak, the more your skills will improve. Improving your communication skills will put you ahead of other people when it comes to getting a job, gaining promotion, even just getting your job done. More importantly developing your communication skills will help you to build successful both personally and professionally. (*Shirley Taylor, 2012*)

People from different paths of life would like to get a better idea of the English used for business purposes and the business world. Therefore, it is advisable to introduce these fairly new and rather complicated subjects step by step, mediating understanding and purposefully avoiding conceptual leaps. In practice, it means explaining the underlying terms and demonstrating the complexity and interrelatedness of things in the reality of business communication, without misleading simplifications and misrepresentations. (*Nazarova T.B.2008*)

In recent decades, a business foreign language has continued to attract keen interest among the business people all over the world. Those who want to learn and to master business terms and business language seek effective ways of learning. The students of economic based institutions and universities are interested with the effective learning of Business English and business communication. Foreign language courses which are organized by educational institutions and numerous language training centers, offer different versions of foreign language teaching for successful communication of business people. (*Makeyeva M.N. 2008*)

The British Council offers services for the preparation and reception of a certification exam for business English. As a part of the International Association of Teachers of English as a Foreign Language, more than 1,5 million members around the world are included in the Business English Section. Nevertheless, despite the huge interest in it, the business foreign language remains as a less studied sphere by linguists: they prefer well-established varieties of foreign language for specific purposes. The goal of the "Business English" is the improvement of the systematic knowledge of basic issues of Business English as a means of global communication, forming general understanding of key business terminology, teaching students to adequately interpret certain features of cultural behavior in business-related contexts. The educative goal of the course is to develop socio-cultural competence and cross-cultural tolerance in students. On completion of the Business English course students are also supposed to be able to use computer-based technologies in business-related contexts (writing business e-mails, using online and offline electronic dictionaries and glossaries). The innovativeness of the course also reveals itself in the complex approach to Business English as an interplay of various registers.

Lots of people find business writing challenging. It is possible to motivate it by the fact that business writing requires decision making about a startling number of factors, unconsciously or consciously. Often, it is not a problem for routine messages if someone makes those decisions unconsciously. However, it can be an important problem for more complex messages. The word- world of business- in this context means a particular area of activity or work, and the people who are involved in it, for example: the world of politics; an influential figure in the business world; the show business world. (*Longman Dictionary of Contemporary English, , 2014*).

Business is a firm or person, company or other organization with the purpose of making profit by manufacturing product, buying and selling goods or providing services; trading generally; the practice of commerce. In the post-Soviet countries, the term business invariably carried a tint of negativity. Undeniably it was a westernized concept and was treated consequently- kept on the edge of standard usage and restricted to a limited number of language users. (*Nazarova T.B.2010*). The names of the phenomena and concepts of the socio-economic spheres are included to economic terminology. It forms the actual part of the lexical system of the language. Developing and changing with society, economic terms represent a history of economic forms and economic ideas. The ties of economy is extremely connected with the socio-political life of the country. The consequence is as following:

the penetration of socio-political terms into economic terminology (strike, democracy, kakistocracy, full employment, privatization, demutualization, entrepreneurship, price denationalization, public ownership, redistribution of income etc.). (Mascull B. 2010). The economy is a part of social and political life, and therefore economic terms, in their turn, are included in the field of socio-political terminology. Bill Mascull made a new attempt at systematizing and structuring essential business vocabulary. The thematic classification of business terms is presented in his book "Business vocabulary in use" in 40 units. Bill Mascull's books presented foreign students of Business English with a wide range of paradigmatic connections and associations between business terms. (Mascull B. 2013).

The same was true of concepts like income, profit, capital, share, shareholder, entrepreneur and many others. However, gradually, with its restrictions and limitations the command-and-control reality gave way to the market economy. In present-day standard Azerbaijani language, nothing is wrong with word-combinations and short utterances like; open your own business / business; to run a business; open your business; he is a businessman; he has a solid income; firm / company capital; to run a civilized business etc. The former negativities have subsided under pressure from the new realities and priorities. Several terms testified to the spread of market economy in the Republic of Azerbaijan as follows: kapital, kapitallaşma (capital, capitalization), market (market), portfolio (portfel), investisiya portfoli (portfolio; investment portfolio), kredit, kredit reytingi (credit, credit rating), tranzaksiya (transaction), audit (audit) etc. (Longman Dictionary of Contemporary English., 2014). These, and many other, terms sound fairly new to the native Azeri speakers; their English counterparts, however, have been part and parcel of standard business usage for a long time and have rightfully been included in "Azerbaijani-English Economic dictionary" compiled by A.A. Aghayev. (Aghayev A.A. 2010)

As a part of economic terminology you can find on the one hand, terms that will be incomprehensible to a wide range of native speakers, for example: futures, warrant, dispatch, factoring, and on the other hand, such terms that are known to the overwhelming majority of native speakers, such as market, demand, employment, tax, interest rate, debt, credit. The analysis of texts on the discipline "Business English" showed that they are dominated by economic terms that are widely functioning in the socio-political speech practice. The frequency of use of economic terms today is much higher than the frequency of use of scientific and technical terms. At the threshold of the third millennium, significant quantitative and qualitative changes occurred in the vocabulary of the English and Azerbaijani languages on the economic sphere, caused by the rapid development of business, economic globalization, the introduction of modern information technologies into the economic life.

Findings

The process of formation of the professional language for economists is as follows:

1. Professional vocabulary is formed on the principles of complementarity: insufficient meanings of market terms are added to the basic registry.
2. Its derived from the capacity of memory and pass into the active vocabulary of a cultural series, related to the general conception of a market economy; general history, literature, cinema are the sources of information; the knowledge is involved on the history of economic studies and economic history.
3. The mass translations of English economic literatures, predetermining the language and peculiarities of borrowing have an important role in the formation of the dictionary.
4. The changes influenced to the terminology of professional vocabulary of economists in the adjacent sciences.
5. The transition of scientific terminology to everyday vocabulary is not occasional.
6. A new terminology is being created in a number of areas of economic research.
7. The speech standards are reduced, first of all, by attracting the corporative slang of the "black marketeer", as well as the everyday slang.

The study of English lexical and phraseological neologisms in the field of economics shows that the English language creates resources for replenishing the word stock of the economic sphere primarily within its own system: due to word-formation and semantic derivation, as well as through interviant contacts, and professional jargon; foreign language borrowings in the new economic English vocabulary insignificantly. The changes that have occurred in the last decades in the economic sphere of the life of an English-speaking society are reflected not only in the lexical and phraseological neologisms, but also in innovative semantic and word-building processes. (*Mascull B.2013*). A significant concentration of neologisms are observed around the concepts associated with the modern macroeconomic trends of world development, with the globalization of markets, the reorganization of enterprises, personnel management and the introduction of modern information technology. The centers of innovation processes were such socio-functionally labeled units as; economy, entrepreneur, global, corporate, market. These take an active part in word-formation processes, even at the expense of fragments that turn into derivational elements: -nomics, wiki+nomics,) -omics(women+omics), -preneur (entre+preneur) . (*Mackenzie I.2010*) . The sphere of e-economics completely or partially uses a whole range of new word-formation elements (info-, tele-, cyber-, e-) and lexical units, or their individual lexico-semantic variants (digital, information, electronic, physical, online, INTERNET, Intranet, virtual). The role of the language of the economic sphere in the presentation of innovations in the common language, in enriching the phraseological fund, is becoming increasingly noticeable.

For mastering the economic terminological units, it is necessary successfully to solve communicative tasks in the professional sphere of communication. We offer a set of tasks for familiarization, training and control on general and highly specialized vocabulary of English. Tasks are based on the original English and American texts from the world economic textbooks. The subject of the texts cover the basic economic issues:

- The contradictions between limited resources and unlimited needs of people;
- Tasks of empirical, theoretical and applied economics;
- Scientific methods of knowledge used by economists;
- The main economic goals adopted in society;
- Types of economic systems;
- Classification of production factors;
- The problem of minimizing production costs;
- Economic functions of the government;
- Structural, cyclical and frictional unemployment.

At the same time, unlike other varieties of a foreign language for special purposes, a business foreign language is an integration of specific content (corresponding with a specific professional activity) and general content (connected with general effective communication skills in business situations).

The purpose of Business English is to help university students, especially those studying economics, finance and management, accounting etc. as well as businessmen, in order to actualize the language norms and rules in real professional communication.

The essential material, based on modern authoritative sources in the field of Business English for specific purposes, theory and practice of translation and interpretation, practical tasks aimed at solving communicative problems in specific business situations should be taught to the students.

Firstly the basics of knowledge about the vocabulary of professional communication, including the definition of the essence and structure of terminological vocabulary, identifying the differences between "terms" and "professionalisms", describing the specifics of economic vocabulary should be given in the teaching process. It is possible to significantly expand the scope and composition of the vocabulary units necessary for reading and

understanding of professionally oriented text, to form skills for lexically acceptable formulation of oral and written statements in an economic context.

Secondly we turn to the study of the specifics of scientific and business speech in English in the framework of the studied specialty. The students will get acquainted with the concept of a functional style, determining the definition of a scientific style, learn about the inner of the stylistic and genre varieties of the scientific style, reveal the specific peculiarities of the scientific style and linguistic means of their manifestation in professional writing (using the example of an English economic text), clarify the concept of official business style, its sub-style and properties. Specific examples of business style (summary, agenda, business letters, emails, faxes and memos) and instructions their compilation will help to master the specifics of the official business style of speech. Practical tasks for comparing the formal style of presentation with the informal contribute to the assimilation of the foundations of scientific presentation.

Thirdly the problems of general regularity of translation transformations, the formation of the skills of translating English texts of various genres within the framework of scientific and business styles of speech should be clarified for the students. The meaning of translation within the framework of the communicative-functional model of translation is clarified, the levels and difficulties of meaningful text analysis are stated, dominants that ensure the invariance of the text while translating scientific and educational texts, instructions, business letters, newspaper-information texts are revealed; some lexical and grammatical transformations are analyzed as a means of achieving the semantic equivalence of the translation; English economic texts are offered for their semantic analysis and translation.

The fourth is aimed at developing the skills of communicating in a foreign language in a professional context. Its goal is to form and improve the communicative skills and abilities of students studying business English, that is, the ability to communicate through a foreign language in various situations in the process of professional interaction with other participants in communication. For the solution of the assigned tasks, topics such as Job Interview, Presentations, Business Meetings, Negotiations must be proposed.

In the fifth, the students should have an opportunity to put into practice the developed communication skills for solving specific problems in real business situations. The improvement of the communication skills of a specialist is carried out due to plausible context and strengthening of the elements of problematical character, promoting the development of thinking mechanisms and argumentative discursive skills of students.

Vocabulary of professional business communication

The term "lexis" (from the Greek. Lexicos - verbal, vocabulary) is understood as a collection of words related to the scope of their use. The lexis of professional communication is a vocabulary inherent in a certain professional group and used in the speech of people united by a common profession. The vocabulary of professional communication consists of three layers: 1) common used (neutral), 2) terminological, 3) professionalism.

Common lexis includes the most common words used independently of the style of speech, which can be found in all types of oral and written statements. It includes a significant part of nouns (chair, economy, book, world, word, progress), adjectives (wide, right, written, past, potential, present), verbs (to make, to take, to go, to solve, to read), all numerals and pronouns, most adverbs, prepositions and conjunctions.

Terminological vocabulary - the words or phrases denoting special concepts of any sphere of production, science, art etc. In contrast to common words - often polysemantic-term, as a rule monosemantic-terms are not inherent to expression as well. Every branch of knowledge operates with its own terms, forming the essence of

the terminological system of this science. “The terms in the field of lexis and the formula in the field of syntax are those ideal types of language expression to which scientific language inevitably tends. (*Abbasova A.M. 2013*) Some “layers” should be included to the terminological vocabulary, distinguishing the sphere of common use, features of the designated object:

First of all, these are general scientific terms that are used in various fields of knowledge and in general belong to the scientific style of speech (analyze, function, identify, significant). These terms form a general conceptual fund of various sciences and have the highest frequency of use.

The specific terms are also distinguished, which have been obtained on a certain scientific disciplines, branches of production and technology; for example, in the economy (equilibrium price, quantity demanded, frictional unemployment, entity); in accounting (cash receipts, going concern principle, gross profit). In such terms, the quintessence of every science is concentrated.

Unlike the other vocabularies, terminological vocabulary is so informative. Therefore, the terms are indispensable in the language of science; they allow to briefly and accurately formulate a thought. The frequency of the use of terms depends on the nature of the presentation and text addressing.

Professionalism is the words and expressions inherent in the speeches of a particular professional group. Unlike terms, they do not form a system, as a professional name is often conditional or built on a metaphor, the term of scientific meaning tends to reveal the essence of the concept. Professionalism often act as a colloquial equivalents of terms, for example, cut down, that is, turn off (from the speech of electricians), batten down, that is, close tightly (from the speech of sailors). In economics, for example, speaking of managing in offshore companies, the phrase “throw on the pillow” is used. Professionals know that this is a procedure shelter for offshore profits from taxation. Professionalisms serve to differentiate and specify meanings.

“Business English” language for specific purposes

Teaching of foreign languages at our university is carried out in a complex manner: phonetics, grammar, lexis are taught in parallel, special attention is paid to the study of economic terminology. In addition to this, language skills such as reading, writing, listening, speaking and, interpretation of the original texts, their free interpretation, business letters and writing documents are put into practice. Practical language learning is the first stage of foreign language teaching. Language elements are studied in close proximity. Knowledge, skills and habits are gained through reading the text independently and communicating freely with the interviewer around the text. At this stage, special attention is paid to the development of students' oral speech. For the speech material professional, sociopolitical, texts related to the life of Azerbaijan, as well as the language of the country we are learning.

The student learns 2500 words and phrases in the teaching process and is able to freely use them in verbal and written speech. In the second phase of the course, a non-business language is taught. The student acquires the minimum terminology in his / her specialty and has the ability to read and understand the original texts, to communicate freely with his / her profession, to make independent comments and judgments, and to use the various scientific sources. The main focus of the course in the teaching of non-formal foreign language is to help students understand the oral speech. The main purpose of foreign language teaching is to enable students to practice the same language. In other words, when completing a student, learning foreign language course, must be able to read and understand the original literature in a foreign language on the specialty and participate in oral debate on any topic in the field of economics. (*Nabiyev N. H. 2013*). Later on, the student gains skills such as free communication around the world economy, compilation of business documents.

The materials are mainly based on modern teaching and learning methods of foreign languages, the development of innovative and effective reading, writing and listening skills, strengthening vocabulary, new strategies, various fields of economy, entrepreneurial activity, modern terminology relating to foreign economic relations, cooperation and technical assistance forms, joint ventures, marketing, insurance, transportation, exchange, customs, exhibitions, fairs, tourism, financial and financial institutions, diplomacy, concluding and implementing various contracts.

Texts and assignments, business relationships, insurance, leasing and cooperation with different types of economic and daily life, contracts for mortgages in Azerbaijani and English will become valuable aids for students. Specialists in the field of international economics are facing with certain language problems in order to create an optimal management model, organize a modern sales system, and provide the necessary services properly. Nowadays, the education and training technologies in the world economy are rapidly changing and naturally, are increasingly used in the establishment of international business and regional relations from commonly used economic concepts in the process of rapid change and modernization. As we know, today's latest technology becomes obsolete of tomorrow's technology. Foreign entrepreneurs engaged in entrepreneurial activity, local legal entities and individuals have to apply frequently to economic terms in establishing business relations, including contracts, negotiating and rendering services. The use of actual diplomatic, political, economic, speech labels and models in foreign languages, as well as teaching materials and literature used to improve the speech process, is a generalized set of scientific and practical knowledge in this area.

Results, Conclusions and Recommendations

Business English and business communication is one of the rapidly developing areas of foreign language research, which means that knowledge of the language and its function will be incomplete without taking into account the peculiarity of the language of business communication, which constitutes an essential layer of communicative competence.

The task of business communication is to reveal the features of interpersonal and mass communication in one of the multifaceted spheres of human communication - business interaction. At the same time, taking into consideration the fact that the English teachers are not the experts in the field of economy. They try to explain the basic concepts used in the business field, thereby help the student to master unfamiliar linguistic material. General knowledge about business communication, business meetings and negotiations, their planning and implementation and making a successful presentation or telephone conversation should be offered on the recommended tasks.

In our opinion, the study of various contexts of monological and dialogical character of business communication and Business English can promote the formation of linguistic and socio-cultural competence of specialists, and also can facilitate the process of social and professional business language adaptation of the future specialists.

Abstract

This research allows us to review and classify the real choice theory in sustainable management research. The research helps us identify the positive and negative effects of sustainable management, challenges and opportunities of real choice theory by examining options. It also explains the similarities between real choice theory and sustainable management and explains how to lead the way in a competitive environment. It also helps us to see the future situations by combining different approaches that have been developed on options. The GST helps to make sustainable decisions in uncertain situations. This study describes the formation of research groups in sustainable management and related departments. The GST develops recommendations on how to solve key problems in sustainable management and strives to balance the decision-making process between managers and decision-making. The research guides us to assess threats and opportunities in sustainable approaches using all three methods developed in GST, one of which helps us to see how one approach follows one.

Keywords: Sustainability, Growth, Administration

Introduction

This research analyzes GST opportunities in sustainable management research. The GST ensures the creation of market conditions and produces methods for the strategic path of direct and foreign investments. The GST application demonstrates how to evaluate investments and performances and how to compete against competitors. In the preparation of this study, three different approaches that emerged during the development of GST were utilized and how they followed each other was revealed. Here, basic issues such as the emergence of GST, when it is necessary, and its properties are described. A general link was established between GST and strategic management and general comments were made using different sources. The three main approaches in GST are; In GST, reasoning is divided into modeling and behavioral approaches and potentially affects the functioning of the GST. All three approaches develop independently and affect sustainable management.

Method

Method of the research literature review. In this study, literature was searched as a method. Practical and theoretical studies on real option theory have been brought together to find out how to follow sustainable growth. The real option theory is a good guide to what education spending is or should be.

Findings

1. Fundamentals of Real Option Theory

The term alternative constitutes the origin of theory rather than alternatives or possibilities, develops and tests relevant hypotheses. The option is a right and is not mandatory to carry out certain future operations at a certain cost. The option is particularly useful in decision-making. In some organizational context, it provides a right in contracts (patents, joint ventures) or benefits in the choice of investment opportunities. The options that grant the company rights but do not give rise to an asymmetric situation. An example of this is the inability of the company to classify its losses as a result of an election. Myers (1997) developed the real option theory and envisaged the development of financial option theory in sustainable decision making. The real option is defined as the opportunity to buy real assets under favorable conditions. These positive terms depend on marketing costs, market power, or other factors in the current market. It is easily seen that sustainable management focuses on the firm's diversity and competitive advantage. In the case of a financial option, an investor who buys an asset has

the right to take the credibility of that asset as well. However, the basic logic underlying real choice theory is that 'real' is real. Increasing cash flows of the company can lead to its growth through R & D planning, product development, patents and so on. effect. Depending on the terms of the contracts, the GST is traded up to real or tangible or intangible assets in the markets to which it is based. Real option theory is divided into several classes. The options, which are referred to as external sources and are subject to market demand uncertainties, are grouped under five headings:

- 1) Company considering entering into the target country by producing any goods
- 2) A company that plans to grow at a future date, including whether to buy stocks of different companies in the market
- 3) The company plans to expand the production to expand capacity or to outsource
- 4) To make the company multinational with the option to change inputs, outputs, suppliers and the like,
- 5) If the conditions are broken, it is classified as withdrawing the company or leaving the market by selling its technologies.

Most companies actually have a portfolio of options in these five categories. Since the company's application of these options in decision-making situations affects the values of the company, it should take these options into account in general decision-making. In other words, even if the company plans a schedule to enter the market, it must also afford options such as firm growth and technological development. As a matter of fact, these values are influenced by other factors.

Previous investments and activities shape the company's knowledge on these issues and become an effective factor if the company decides on these areas again.

Another term, the shadow option concept, suggests that the opportunities and opportunities that a company can create with its talent and resources should be put forward and appreciated. Firms that do not have early investment opportunities or do not follow the opportunities related to investments may not be able to access this investment even if they want to make the same type of investment in the future or it may be impossible to make such investment under the same conditions.

Since options related to real assets are evaluated in many respects, they affect the value of different pillars and the investment decision of the company.

2. Approaches in GST

Three different approaches to GST in sustainable management have been developed. These theories help us to better understand GST;

1. Problem configuration - reasoning; It is also called real options logic, which is based on logic and heuristics and offers real choices as a way of thinking by managers. This approach demonstrates various strategic management decisions and examines the options, timing, connections and uncertainties in a strategic framework.

2. Valuation and modeling; real option approach based on formal analytical (mathematical or simulation) models for value options and generating hypotheses for research. This model essentially includes the collection of primary data inputs to provide discounted cash flow estimation (DCF) and determination of the company's net present value (NPV). After these data are collected, the model continues to be used with different analysis or simulation methods.

3. Application planning - behavioral approach; behavioral perspectives focusing on the implementation of real options in organizations. After reaching a strategic investment proposal, a path is drawn up by preparing a plan for deciding which of these options under different conditions and developing an appropriate working policy.

Each of these stages is a set of challenges and opportunities for the company to gain value. They are becoming a cycle in itself. These four basic lifecycle phases, which are similar to product development processes in high-tech firms in particular, can be described as follows: 1) Defining a hidden option, 2) Creating a basic or extended real option by searching, gathering information and obtaining or editing the necessary resources at a cost, 3) to manage, maintain and strengthen the actual option by applying the necessary protection or improvement costs; 4) to adopt the real option.

a) Real Option Reasoning

Most of the strategy literature sees GST as strategic and intuitive thinking, creating and adopting options. GSM captures hypotheses that depend on verbal rules without the help of analytical modeling.

Given the difficulties of correctly matching the theory of financial options to real investment decisions and the many complications in evaluating the real options highlighted earlier, it is natural that GSM is widely used in the strategy. GSM is very suitable for defining and synthesizing the actual option value, even if options cannot be formally evaluated. GSM offers organizations a variety of ways to help them make strategic investment decisions better under uncertainty.

b) Real Option Valuation or Modeling

There are basic assumptions in formal modeling of real options. These; being certain and transparent, presenting new theoretical relationships with comparative statics and numerical analysis, and providing simulation. Mathematical or simulation models are useful as a tool for proposing and developing comparative static analyzes and encourage the development of this research within strategic management. Despite such important and strengths, there are disadvantages to this approach. For example, mathematical modeling is based on a number of assumptions that would hinder the implementation of the GSD model. In other words, it is sometimes time for modeling scholars to move away from organizational reality.

c) Behavioral Perspectives on Real Options

This approach aims to relate to organizational realities and draw attention to the human or behavioral nature of management. It is stated that the application of GST is limited if the necessary conditions such as the existence of real life frictions, organizational flexibility and application flexibility and decision flexibility and information accuracy cannot be provided. If there is a lack of information about the value of an asset at the time of decision, managers are investing less in good opportunities and over-investing in bad projects. These restrictions naturally pose practical difficulties in the effective management of real options. The GST adopts these behavioral assumptions in order to better connect with existing behavior strategy research. Investigating the effects of limited rationality, lack of knowledge and behavioral inaccuracies is prioritized in research on the implementation of real options.

3. Real Option Theory

1) Firm heterogeneity and the nature of competitive advantage

On a sustainable basis, it is to investigate issues such as firm behavior, organizational performance outcomes, and heterogeneity in terms of competitive advantage. The heterogeneity of resources is defined as the main reason why firms make a difference in profitability and survival. Knowledge, competence and learning are at the heart of the capabilities that enable the company to take advantage of new opportunities. By focusing on the firm's investment opportunities and information that is specific to the firm, GST helps us to understand why this difference exists and what gives the firm advantages in situations of uncertainty.

2) Organization and management model options

Managers determine four ways how to provide or distribute the resources needed to achieve growth, one of the company's strategies: 1) buy (sell) or take over (deactivate), 2) internal development 3) leasing, contract 4) sharing / allied. Purchasing is carried out on both the buying and selling sides. Other modes (leasing / contracting or sharing / allied) are often more preferred in strategic use of external resources through cooperation with other firms. A firm can buy or contract another company's technologies to fill gaps in its technological portfolio or to further develop its own resources.

4. Challenges in Strategy Theory

Although GST makes good investment decisions in terms of finding resources in firms, the strategy needs to master the basic assumptions in order to become theoretical in the field of strategy.

In this table: Why do firms differ in the creation, recognition, or use of options? Why do they fail in some cases despite the choice of valuable growth options? Or do they sometimes succeed when such opportunities are limited? How can ideas be generated to make more efficient use of these growth options by authority rights and internal resource allocation? What are the defining characteristics of the firm's real option-based view and how can existing theories complement each other?

Unlike traditional industrial organization economics and game theory approaches that assume business environment and firm responses are predictable, various theories used in strategic management recognize that the business environment is unclear and unpredictable, acknowledging that there are limited rational managers and are capable of predicting and planning future prospects. Uncertainty is a key driver that separates the firm's alternative views and its consequences for strategic investment. There are also differences between theories in terms of focusing on cost-effectiveness, knowledge, learning and the role of decision-making flexibility. GST approaches all of these factors in a comprehensive manner and therefore has the potential for significant integration with other theories focusing on aspects of firm investment and decision making in the event of uncertainty.

a) Role of Management in GST and Organizational Facts Many sustainable management research uniquely enriches the practical application of GST, taking into account human traits and cognitive innovations, managerial incentives, reward structures, control systems, operational routines and entrepreneurial culture. All of these affect the success of sustainable investments of firms. Cognitive constraints such as thoughts and habits, attitudes, validation biases, pessimism and uncertainty, or behavioral biases can be included in the subjective judgment to make this option more valuable. How can organizations better solve creativity and uncertainty? Different managers or CEOs should be able to anticipate the appropriate risk for different organizations, different industries and firms to identify, create and use their real options more effectively, and develop appropriate portfolio for the life stages of options for innovation and incentives.

b) Integration between real option approaches

Since creating or purchasing flexibility is usually cost, it is necessary to consider these options to see that the cost of flexibility benefits exceeds the total cost. The value of an individual project needs to be considered within the broader strategic and organizational context. Therefore, these contributions should be utilized by going beyond qualitative and quantitative discussions and bringing together different GST approaches. The more strategic use of ROR as a framing tool, the clear balance of organizational realities, constraints and implementation issues, such as an analytical valuation / modeling methodology, should be determined. In order to assess the gaps between theoretical and practical, to identify the sources of these gaps and to identify the descriptive and normative value of a more integrated GST, it is necessary to complete and further examine the GST approaches. As the field evolves, a more unifying approach, including important organizational facts, is needed for better integration of qualitative and quantitative approaches.

c) Future research designs This theory encourages the use of new methodologies, a greater focus on the individual project level from the business unit and strategic perspective, and the collection of more basic data on individual real options. First, new methodologies such as laboratory experiments, simulations, fieldwork and surveys provide useful data to existing evidence from secondary or large-scale empirical data, including investments made by firms. These methodologies are more appropriate to gather certain information about managerial decision-making and to make a real investment decision. Simulations assist portfolio choices in behavioral or managerial issues that may influence decisions with different options. A review of the analysis units in real option studies helps to advance strategy research on real options.

Results, Conclusions and Recommendations

This article examines the real option theory in sustainable management. In the research, it was shown that more studies and appropriate integrated methodologies should be adopted in order to bring sustainable ideas into individual case projects and business unit levels. Increased interest by researchers, taking into account behavioral and organizational facts and constraints, should be both strategic and valuation components. Future research should address the various stages of the actual option life cycle in organizations, while at the same time focusing on further analysis and expansion of the applicability of GST in management and organizations. Research should therefore be in the form of an organization and practice, rather than a dedicated valuation or purely strategic reasoning. Organizational processes require deeper thinking about managerial incentives and control systems and behavioral methods. Government expenditures should also be well planned to ensure sustainable growth. In order to ensure sustainable growth, especially in the education sector, it is important that the state develops a strategy in advance. This theory also provides a good option for government expenditures and investments.

Methods of Optimization of Income and Expense of the Organization

Elvin Seyfulla ABDULLAYEV

UNEC, Faculty of Finance and Accounting, Doctorate

E-mail: Elvin06@bk.ru

Abstract

It should be noted that the increase or decrease in the profitability of the entity is related to many factors that are or may not depend on the level of economic activity. Important factors should be emphasized in terms of sales volumes, reduction of production and circulation costs, and price factor. It is important to emphasize that there are interdependencies and different tendencies among the factors mentioned. So, increasing the sales volume may require a lowering of your product and service cost. At this time, it is impossible to exclude the need to buy resources at higher prices. Of course, the apparent increase in the volume of sales may lead to a decline in costs for the product unit, and the lowering of the cost value of the product may lead to a decline in the quality of the product and, consequently, a decline in demand. The price factor affects different aspects of the price of the product or purchased resources.

Keywords: Income, Expense, Cost, Sales volume, Product

Introduction

It should be noted that the increase or decrease in the profitability of the entity is related to many factors that are or may not depend on the level of economic activity. Important factors should be emphasized in terms of sales volumes, reduction of production and circulation costs, and price factor. It is important to emphasize that there are interdependencies and different tendencies among the factors mentioned. So, increasing the sales volume may require a lowering of your product and service cost. Currently, it is impossible to exclude the need to buy resources at higher prices. Of course, the apparent increase in the volume of sales may lead to a decline in costs for the product unit, and the lowering of the cost value of the product may lead to a decline in the quality of the product and, consequently, a decline in demand. The price factor affects different aspects of the price of the product or purchased resources.

Increasing profitability of farmers depends largely on the level of revenue and expenditure and their optimization. Revenue and expense optimization involve finding additional options for improving performance.

Of course, increasing the organization's revenues is primarily accomplished by increasing product sales and sales, and improving the quality of the product by using cutting-edge technologies. In the modern era, competitive product production paths are diverse, and in general, this is due to increased product quality and production costs. Notwithstanding, there are a number of issues related to improving the quality of the product - improving the quality of the product, improving the technical level of the production, developing methods that characterize the quality of the information, the characteristics of the products with a higher specific weight economic content, the design, analysis and interpretation of the models that reflect the impact of the technical level of production on the quality of the product, and especially those of other types. About cost reduction, productive use of production resources at the expense of increasing the organizational and technical level of production will reduce the cost of the product.

One of the issues of raising corporate income is optimization of costs to minimize losses during product cost management and sales. The cost optimization tool includes tools for routine management and planning. From the point of view of efficiency, it is important to emphasize that if cost reduction does not affect the production process and the overall quality of the product, optimization of revenue and expenditure is relatively "painless".

Optimization of expenditures is a measure of the amount of expenses that maximizes the profitability of the same under other equal conditions. Excluding costs (many or less), or excessive overheads or a decline in production, will result in a decline in theoretically the amount of profit. When designing the budget, mitigation of costs on items is usually not accompanied by actual cost savings, because no change in the business process at this time. It is particularly important to emphasize that in some cases, even if the actual cost reduction is achieved, its positive effect will be short-term and negative consequences will soon come to an end.

Method

The solution to the problem of income and cost optimization in the organization depends on the expectations of first-class optimization rules. Thus, the purposeful solution of this issue allows the organization to achieve maximum efficiency with fewer losses. Minimizing costs is a good idea to achieve. Of course, it should always be an attempt to effectively manage, rather than reduce costs. Thus, their minimization and maintenance at the required level can be optimal. Sometimes it is necessary to increase expenses for certain directions in order to reduce overall costs.

For the purpose of optimization, the following grouping of costs is appropriate:

- raw materials, input costs;
- production costs;
- expenditure on financial transactions;
- general and administrative costs [79, 93, 108].

Expenses are distributed among each of these groups for the same sex function. For this purpose, a list of the functions performed first within the enterprise is compiled. Executive, labor, time, other resource costs, and after each function Expenses are distributed among each of these groups for the same sex function. For this purpose, a list of the functions performed first within the enterprise is compiled. For each function, performance, labor, time, other resource costs, and then features that are not too costly are defined. The formal work will be completed, and the creative phase will be started: methods that will reduce the cost of more cost-effective functions should be found and already and recurring functions should be identified and eliminated, and the same resource should be sought in several functions.

It is absolutely unacceptable to deduce the expense items in the process of production optimization in the following sections:

- Maintenance costs and maintenance costs (lack of service is causing equipment failure, production disruption, financial loss);
- quality control of the product. Production and enterprise-controlled products are essential to losing customers and attracting new ones.
- Staff maintenance costs. Compensation of employees' labor is the fulfillment of their duties, at the same time, the loss of employees negatively affects the production and sale of the product.

In our view, the following set of rules should be expected in the process of the optimization plan:

- It is necessary to periodically deal with costs, not when required.
- In some cases, it is possible to achieve a reduction in the total cost of expenditure at the expense of increased expenditures for any direction.
- Each expense unit must yield a maximum result.
- There can be no shortage in spending cuts.
- Cost reduction cannot always be the maximum. Minimizing costs can be optimal by keeping the acquired level back later.

- It is dangerous to reduce expenses (insurance, product quality, protection, etc.) that protect against major losses.
- All employees should be involved in the cost reduction process and each must have a personal assignment.
- Cost optimization should be accomplished simultaneously with optimization of revenues.

It is important to consider that a number of questions must be answered to justify the decision to reduce any costs:

- How can you increase the effectiveness of reducing costs and is this possible?
- How can this cost reduction affect the activities of the organization in one or several years?
- How much are the costs associated with the risks and how their decline will affect the likelihood of these risks?
- What are the responsibilities and functions of these expenditures, and their volume does not have critical weight?

The cost optimization policy is more urgent in crisis situations. Reducing communication costs can play a key role in raising cash incomes through expanding the sales network. Looking for ways to increase revenue before reducing costs (what's new to customers, finding new buyers, finding markets, lowering the cost of their goods and services). In order to minimize the risk of non-repayment of debtors, the entity should periodically monitor the customer's credit history (purchase and repayment date). Customer credit repayment capability can be assessed based on the credit history of its relationship with the entity. Comparative analysis of the costs and benefits of credit policy should allow for identifying a strategy that the number of outstanding receivables is expected to be recovered. At this time, discount programs are used to pay in advance, cash payments and receivables in advance.

If revenue cannot be increased and costs are minimized, then their structure should be seriously analyzed. For example, if travel costs are large, it will not be possible to reduce the cost until you know how much money is spent.

The dramatic increase in revenues in comparison with the enterprise's expenses contributes to its successful activity. Reduction of expenses is carried out by searching for expense items that do not affect production based on analysis of the current estimate of the enterprise.

Findings

Expenditure optimization can be carried out using one of three models of expenditure reduction in the budget:

- Express;
- Fast;
- Systematic.

Costs of the first model are divided into several groups. Financing capabilities are calculated based on cost priority: - high priority costs (it is not possible to continue the operation of such an enterprise without cost) - the necessary raw materials, fuel, labor payment and so on. expenses on

- priority costs (costs that can be caused by interruptions or downtime in business venture). Optimization for these costs is inaccurate.

- possible costs. This includes the promotion of staff training and discounts. It is possible to stop this group expense (especially under financial difficulties);

- unnecessary costs (financing of activities that do not affect the performance of the entity and the quality of production). Such costs can easily be abandoned.

The rapid redundancy model explicitly assumes that certain groups will not be able to cope with costs, but will save on current financial costs:

- Reduction of raw materials and supplies. The probability of product quality decline before the cost optimization process should be considered. From the point of view of this issue, it is common practice to revise the contract with consignors or seek new partners.
- Reduce costs for transport and communications services (as a classic solution, parking lot is reduced, new internet, telephone, new power supply contracts). It is aimed at searching and evaluating the cheapest options of all enterprise divisions of the enterprise.
- Reduction of salaries and staff. Most organizations prefer this variant first. Of course, the optimization of the staff should be such that the lack of workforce does not adversely affect the production process. Reduction of wages must be replaced by discounted amount, free meal, improved health insurance.

Systematic reduction involves more cost-effective management of all budget expenditures and business mechanisms:

- Reducing some investments in favor of quality. Most organizations prefer investment in new technologies in order to increase profits. Management of resources and optimization of investments can give effect if they relate to perspective projects.
- modernization of trade relations and constant search of new consignees (self-governing bodies or organization's management are looking for more favorable contracts with suppliers).
- economical production. The essence of the organization is considered by the potential customer. The focus is on the final product (not its preparation method), resulting in reduced production costs.

The following methods are used to evaluate the costs of reducing costs:

Cost name	Expenditure items	Total
Implementation of Pareto Law	20%	1/20
ABC method (active base costing)	25%	1/25
Target-costing method	30%	1/30
Kaizen-costing method	35%	1/35

The ABC method assumes that costs are split into expenditure items. It uses the same method to determine the real expense level, the lower margins of the calculation items, and the cost of the transaction. In this case, basic production processes, production costs and product costs and their carrier rates are defined. Cost driver - measures the activity's activity and is calculated by the following formula:

$$Rd = P / D$$

Here, Rd- the cost carrier rate, P - process costs, D - the cost carrier (transaction number).

This method is widely used in accounting estimates of product cost in management accounting. It creates favorable conditions for lowering the product cost and optimize costs and is intended to allocate overheads for each product unit produced.

Based on the Target Costing model, the product cost is based on market value and profit. The main indication of this method is the target value of the product, and it is calculated as the difference in the price. The application of this method involves the following consistent stages:

- a) identifying the target cost value of a product unit and cost;
- b) comparing the targeted cost value with the cost value;
- c) preparation of measures to eliminate differences.

The main goal of the Kaizen-costing method is to achieve high returns with high levels of revenue and minimize high profits. Unlike the Target Costing model, the use of this method determines unnecessary costs until the product is fully ready and measures are being taken to reduce them. For example, Toyota is testing the possibility of damage to the environment by their moving parts before the vehicle is fully used. If any problems are identified, then this problem is eliminated and the machines are put on sale, or more precisely, such costs that are likely to occur in the future are predetermined and eliminated. Thus, the above-mentioned methods help reduce and optimize costs and achieve high returns on the net.

Results, Conclusions and Recommendations

In the conditions of a developed modern market economy, the main goal of each enterprise is to obtain high profits. The high volume of profits largely depends on the level of income and expenses, their optimization. Under the optimization of income and expenses refers to the search and identification of additional options for their reduction / increase, application in practice. To increase revenue optimization should pay attention to the following.

1) Ways to increase profits.

- Increase the volume of production and sales of products. To this end, an increase in online sales is one of the main factors.
- Improving product quality with the use of new technological equipment. In production, you can increase the quality of products by using new advances in technology and attracting new equipment. At the same time, raising the level of education of workers will have a largely positive impact on product quality.
- Sale or rental of unused equipment. Selling or renting equipment that is serviceable, but for some reason is not used in enterprises, can also lead to higher incomes.
- Effective use of inventories and labor resources. Computerization and automation of production leads to the rational use of inventory and labor resources, which, in turn, is the reason for increasing income.

2) Ways to improve profitability

- reduction of costs for the production and sale of products
- increase the cost of production by improving its quality
- improvement of production assets
- increase production and management.

One of the ways to optimize revenue is to control the cost of production while minimizing losses when selling products. To solve the problem of minimizing losses, a special program should be compiled. This program should be comprehensive and aimed at exploring the factors affecting loss reduction.

An integral part of this program is to increase profits by influencing labor-intensive and able-bodied indicators using new equipment and technology, material resources. For this reason, along with commodity labor, it is necessary to look for ways to reduce the costs of living labor, which leads to an increase in profits.

Much attention is paid to this source in labor-intensive production areas.

Use of machinery and equipment produced in the country and abroad, increasing labor productivity and reducing the labor intensity of products through the application of tried and tested technologies in production, reducing unnecessary staff and jobs, improving the system and management structure, combining small workshops and production areas, reducing labor the cost of re-work on the correction of defective products, the elimination of payments for downtime and additional working time during the holidays, non-working and other organizational

and technical measures aimed at reducing wages may lead to an increase in profits. Since the organizational and technical measures to reduce wages are different, the methods for calculating their impact on costs and profits also differ.

The Role of Education in Raising the Efficiency of Human Resources Use in Azerbaijan

Natavan NAMAZOVA¹

¹Ph.D Student of Azerbaijan State University of Economics (UNEC),
E-mail: natavan.namazova@unec.edu.az

Abstract

Azerbaijan is currently experiencing improvements in its economic development model. Today, the vast majority of economic reforms have been completed in our country. The article considers investigated adequate mechanisms and identified directions of the use of human resources in the country in socio-economic challenges of the modern era. There were analyzed organizational and economic mechanisms of the search process of the reforms in education, raising the level of education, implementation of measures to form a modern vocational education system, the increasing investment which focuses on human development, adequate mechanisms of human capital development at the level of modern requirements. As one of the most noticeable areas of the modern era, it is the qualitative improvement the use of human resources in working places and working conditions. The article also includes the assessment of such factors.

Keywords: Human resources, Efficiency, Human capital, Reforms in education

Introduction

Under current conditions, the development model associated with the assurance of sustainable economic development in Azerbaijan is in the process of improvement. Thus, our country is demonstrating a stable macroeconomic development model; moreover, it is at the stage of successful realization of such measures as diversifying the national economy, raising its competitiveness, forming the sources of economic growth through the most efficient utilization of national resources, as well as human resources, and accelerating socio-economic development in all regions of the country. Nevertheless, as a long period of time is required for the implementation of processes aimed to reduce dependence of the country's economy on mineral resources, oil prices have decreased on the world markets, as a result of problems in the credit and financial system, difficulties occurred in regard to the consequences of the global financial crisis for the last years, devaluation of the national currency of our country, negative tendencies in the banking system, an increase in problem loans and other such issues the processes of strengthening the sustainable economic development criteria of Azerbaijan have been relatively facing problems. In such a situation, to intensify development indicators of the national economy, a serious necessity has arisen for enhancement of the efficiency and productive use of the country's resource potential and improvement of the relevant processes.

Today, one of the strategic objectives facing our country is to provide sustainable economic development and increase the living standards of the population through further modernization of the socio-economic life and adaptation to the best world practice. Modernization is primarily associated with the successful application of advanced technologies and management techniques, as well as the application of innovation created based on scientific and technological progress in the socio-economic life of the country. The main direction in this regard is the acceleration of the integration of national economy into the world economy, as well as the development of human capital in the country and the assurance of the acquisition of modern knowledge and skills by a person. As a result of new order and developments, it has gained topicality importance of having manpower and labor, and at the same time the necessity of establishing a qualified society for ensuring economic development (Zeynalova Z., 2017; p-13). Being one of the most important conditions in the process of successful integration of the economy into the global system and reaping benefit from the international competition, the development of human capital is the main objective of the education system of the country.

Following the development concept of the Republic of Azerbaijan, to provide the individual with comprehensive knowledge and skills institutional bases, infrastructure and human resources should be developed. The educational development creates a basis for the improvement of the population wellbeing in the country and building high-quality life for the individual. Education allows people to promptly adopt technology, to get a decent place in the labor market, and to join the lifelong education process, to choose a healthy lifestyle and the right attitude towards the environment.

Human resources and related labor resources are of great importance among the country's economic resources and have specific features significantly impacting on sustainable economic development. Prof. Sh. Muradov and a group of researchers note that the labor market is one of the most complex elements of the market economy. The labor market ensures the distribution and redistribution of public labor over the various sectors and areas of activities of the national economy, identifies the level of efficiency of employed labor and forms the real demand and supply of human resources (Muradov Ш.М., Гёзалова А.К., Эфендиев Р.Дж. 2007; p-264). Prof. T. Guliyev noted that the main purpose of human resources management is to efficiently benefit from their potential and creative capabilities. In the prevention of risks, Japan gives priority to human resources, assurance of intra-company stability and resource-saving, while the USA gives priority to financial resources and dynamic development of capital (Quliyev T.Ə., 2001; p-522). As we can see, Japan as one of the strongest countries in terms of economic development attaches great importance to human resources, and as a result, the cycles of the prompt delivery of human intellects to production processes in the country has been organized optimally. Moreover, today, conceptual approaches to human resources management and the principles of systematicity are more needful, so the relevant complex, long-term measures need to be implemented. To ensure the efficient use of human resources, the features of these resources affecting economic development processes and factors of human motivation should be seriously taken into account (Əliyev T.Q., Əliyeva Ş.T., Əliyev T.R., 2012; p-303). At the same time, the historical features of human resource management and its impact on the development of public relations should be widely observed (Məcidbəyli R.X., 2013; p-112). At the same time, the assurance of the most effective management of human resources and their effective use should be in the focus of attention as an important issue such as balancing human resource management in the context of social development (İsmayilzadə Ə.A., 2012; p-472). The researchers, H.Allahverdiyev, K.Gafarov and A.Ahmadov state that the labor market is an integrated system reflecting all elements of economic circles. Effective use of labor resources can be observed in two ways. On the one hand, employment of the able-bodied population to eliminate unemployment, and, on the other hand, the employment of qualified personnel and specialists able to meet the demand of the economy. Efficient use of labor resources and its placement over economics areas is a perpetual problem (Allahverdiyev H.B., Qafarov K.S., Əhmədov Ə.M., 2012; p-508).

Method

In this respect, due to a large number of internal regulators of the labor market in the country as well as considering the social importance of its effective functioning, it is necessary to effectively manage and regulate the labor market. Therefore, the main priority is to ensure efficient use of labor and human resources and to cover the employment of the labor force existing in the country. Hence, the main problem is the appropriate determination of the development priority and implementation of the relevant comprehensive measures, in this case, additional opportunities may arise for balancing labor and human resources and optimizing their use regulation system in the context of sustainable economic development. In this respect, to regulate the maximum use of labor and human resources, the development priorities should be considered in the following areas:

— first of all, source data related to the labor, human resources and labor force of the country should be thoroughly investigated and clarified;

- the indicator system of the labor market of the country should be analyzed via scientific-economic approaches and adequate regulatory mechanisms should be identified for the gained results;
- necessary components, as well as the composition of the economically active population, should be analyzed to determine the supply indicators of the country's labor force;
- relevant regulatory mechanisms should be developed through studying the current state of the labor market, its balance indicators, and structure;
- analysis of labor market infrastructure and efficiency indicators should be carried out and necessary measures should be taken;
- conceptually strategic targets and relevant regulatory mechanisms should be defined to efficiently involve human resources to the sustainable economic development processes;
- employment of the population in the country, measures for boosting employment on qualitatively new level should be provided and so on.

Improvement of the labor and human resources recording and analysis in the regulation of labor and human resources use can be considered one of the important measures. The researcher, E.Ahmadova, notes that today, increasing the efficiency in the use of labor resources being closely associated with the appropriate placement of the workers within the company requires strengthening the interaction of elements within the "working time-production-money" scheme, which is the attribute of the market economy (Əhmədova E.K., 2011; p-31). At the same time, as important economic development in regulating labor and human resources use, the complex development of entrepreneurship and stimulating and encouraging mechanisms are of great importance in world practice. According to researcher A.Orujov, small and medium-sized enterprises should be used more widely to effectively use local labor resources from the regions of the country (Orucov A.İ., 2013; p-48). This issue positively affects the enhancement of economic development and provides additional incentives, practical tools, and mechanisms to constantly create new workplaces, ensure efficient use of human resources, increase incomes of the population living in the regions, ramp up consumption levels, and in general, to organize sustainable economic development. It is known that more than half of the population lives in rural areas in our country. In this regard, the intensification of the solution of economic problems in agrarian entrepreneurship development in the regions can create new opportunities for efficient use of human resources, as well as provide effective and productive distribution of labor resources concentrated in the regions. While investigating economic problems hindering the development of entrepreneurship in the agrarian sector, E. Ibrahimov states that the dynamic development of the national economy directly depends on the character of country's integration into the world economic system, and the level of the financial well-being of the population directly depends on the effectiveness of entrepreneurship in the country ... Notwithstanding the important activities carried out in the direction of assessment of the level of the relationship between employers and employees, overall assessment of labor market situation, balanced development of the regions, opening new workplaces, comprehensive support of the economic activities, strengthening the regulatory framework for entrepreneurship development, a need for discrete approaches to entrepreneurship occurs at different stages of development. Such a situation is related to changes in entrepreneurship development priorities (İbrahimov E.R., 2011; p-44). Considering the complex and new prerequisites for the problems that led to the slowdown in entrepreneurship development would undoubtedly allow for the formation of modern approaches to the use of labor resources. Furthermore, the expansion of the development of small and medium-sized businesses, along with the labor market regulation, creates new trends in the population's employment boosting. While studying these problems in Nakhchivan region the researcher, N.Adilova notes that there is no sharp unemployment problem in the labor market in Azerbaijan. However, the labor market has quality problems, labor resources do not meet the needs of our economy and these problems should be solved ... To prevent unemployment and solve this problem in the Azerbaijan Republic and the Nakhchivan Autonomous Republic, the development and implementation of the employment program for all populated areas are taken under the control of the government. Today, as the only way to eliminate unemployment is the establishment of a comprehensive environment for the creation and

development of small and medium-sized enterprises, more attention has been paid to the development of this sector at the state level (Adilova N.Q., 2014; p-24). Nevertheless, in order to use efficiently the human potential of the region, with the purpose of carrying out structural changes in the agrarian sector in line with modern market relations and enhancing its impact on employment boosting it was considered important to establish new structures in such an important area of the region's economy and to develop the modern infrastructure for agricultural products sale, which is crucial to raising the incomes of the rural population. All of this, at the same time, will provide an opportunity for a comprehensive overview of the use of human resources in various sectors of the economy, identification of the new development priorities in the management system of the use of these resources and enhancement of the country's sustainable economic development. The formation of qualitatively new models and development priorities for the use of human resources in the regions is directly associated with the determination of economic resources and economic maneuver potential in this sphere in each region of the country.

Findings

There is no doubt that each of these issues is useful in terms of sustainable economic development, but a comprehensive approach to the development of adequate mechanisms and implementation of the relevant measures that will enable the solution of management issues on the use of labor resources and human resource for achieving productivity. Human resources being an important economic resource are capable of intensifying or preventing the country's sustainable economic development by influencing every sphere of the national economy. From this point of view, there is a need for a deeper study of each element of human resources, systematization of their features, and their consideration in the practical processes of economic development.

In the fast-growing Republic of Azerbaijan, there is a need for new steps in responding to the education system to the challenges of human resources development and adapting the quality of education to European standards. To improve the quality of education it is necessary to re-establish the education management system, to improve human resources in this area and to increase the authority of the teacher profession. One of the important steps in educational development in the country in recent years is the "State Strategy for the Development of Education in the Republic of Azerbaijan". This strategy envisages large-scale measures in five strategic directions for the establishment of an advanced education system in the Republic of Azerbaijan for professional teachers and education managers taking leading positions among world countries for quality outcomes and coverage.

The first strategic direction focuses on the creation of personality-oriented educational content based on competence and covers such important goal as development of curriculum for all levels of education, including pre-school, general, primary vocational, secondary specialized, and higher education. The second strategic direction envisages the modernization of human resources in the field of education. The third strategic direction involves the creation of responsible, transparent and efficient management mechanisms in education. The fourth strategic direction envisages the creation of an educational infrastructure that meets modern requirements and provides lifelong education. The fifth strategic direction entails the development of the model of educational system financing in the Republic of Azerbaijan, which is economically stable and meets the same standards as the world's leading educational systems. (Order of the President of the Republic of Azerbaijan 2013).

A professional human resource with a high level of education is the basis of the country's intellectual potential. Today, successful and sustainable economic growth is being achieved through the purposeful development of human capital. All of this increases the priority of education in public expenditures. State education expenditures have high economic profit for society.

In modern life, the role of education in economic has significantly increased. At the moment, education should implement such duties as the tanning of the required knowledge and skills in the economy, as well as the

comprehensive training of the citizen for the integration into future life and society. The most important factor raising the role of education in economic life is the satisfaction of human need in lifelong education. At the same time, rapid technological progress requires regular updating of knowledge and skills. This increases the demand for new and more relevant qualifications and the development of competence.

According to the United Nations Human Development Report for 2018, ranking 80th place it was included in the "High Human Development" group from the "Middle Human Development" group. Accelerating the pace of economic growth Azerbaijan has achieved great success in terms of poverty reduction and average lifetime growth. At the same time, the statistical analysis of leading international organizations shows the necessity of raising the level of international competitiveness indicators of Azerbaijani education, as well as the rating of higher education institutions located in the territory of the Republic of Azerbaijan.

Table 1. International competitiveness indicators of Azerbaijani education

HDI Rank		1995	2000	2005	2010	2011	2012	2013	2014	2015	2016	2017
80	Education index	0.618	0.640	0.652	0.681	0.684	0.689	0.698	0.709	0.709	0.709	0.709
80	Government expenditure on education (% of GDP)	3.3	3.9	3.0	2.8	2.4	2.1	2.4	2.6	3.0	3.0	3.0

Steps are being taken to gradually increase the duration of education in many progressive countries. The total duration of study in Canada, France, the Netherlands, and the Czech Republic is 14 years, in Germany, Great Britain, Sweden, Australia, and New Zealand is 13 years, in the USA, Finland, South Korea, Poland and in some other countries is 12 years. The total education period of eleven years exists in a small number of countries. According to the Organization for Economic Co-operation and Development, a one-year increase in education duration in any country leads to 3-6% of GDP growth in the country.

Education, which carries theoretical character only and is not being enriched by practical knowledge and skills as a result of scientific-technological progress, innovation and modernization over the past 30-40 years, has lost its fundamental importance. In this regard, along with academic knowledge, the importance of practical competence, knowledge, and skills is also pulled out in the formation of educational content. Competence is the ability to effectively and efficiently apply gained knowledge and skills in practice. It ensures the knowledge and skills gained by the individual to result in a specific activity. Competence-based education provides more effective social and economic development.

Table 2. Education index of Azerbaijan Republic

Education index	2017
Expected years of schooling (years)	12.7
Education index	0.709
Expected years of schooling, female (years)	12.6
Expected years of schooling, male (years)	12.7
Government expenditure on education (% of GDP)	3.0
Gross enrolment ratio, pre-primary (% of preschool-age children)	23
Gross enrolment ratio, primary (% of primary school-age population)	106
Gross enrolment ratio, tertiary (% of tertiary school-age population)	27
Literacy rate, adult (% ages 15 and older)	99.8
Mean years of schooling (years)	10.7

Mean years of schooling, female (years)	10.5
Mean years of schooling, male (years)	11.0
Population with at least some secondary education (% ages 25 and older)	95.6
Population with at least some secondary education, female (% ages 25 and older)	93.8
Population with at least some secondary education, male (% ages 25 and older)	97.5
Primary school dropout rate (% of primary school cohort)	1.1
Primary school teachers trained to teach (%)	90
Proportion of schools with access to the Internet (%)	27
Survival rate to the last grade of lower secondary general education (%)	96

Globalization processes require the integration of education systems of different countries. A set of competencies recommended by the Council of Europe is assumed as a basis for targets. Given the growing student-teacher exchange, the Bologna process, aimed to unify education standards, is accelerating. The role of the private sector in higher education is gradually growing, and public funding is replaced by private sector funding. While public funding is 90 percent in Germany, Austria, and Italy, it is only 50-70 percent in the United States, Australia, Japan, and Canada.

Table 3. State budget allocated for science

	2000	2005	2010	2012	2013	2014	2015	2016	2017
The state budget allocated for science, mln manat	9,3	28,8	92,8	116,7	117,0	124,2	113,2	110,2	109,8
The proportion in Gross domestic product - percent	0,2	0,2	0,2	0,2	0,2	0,2	0,2	0,2	0,2
The proportion in The state budget expenditures - percent	1,2	1,3	0,8	0,7	0,6	0,7	0,6	0,6	0,6

Source: Azerbaijan figures. Statistical summary. SSCAR. Baku, 2018

The amount of educational expenditures in the state budget stands at the very first places in Azerbaijan. Thus, 2 billion 150 million manats were allocated for educational expenses from the state budget of the 2018 year. This figure is 210.3 million manats or 11.7 percent more while comparing with that in 2017. It should be noted that 1 billion 830 million manats were allocated for education in 2016.

First of all, the identification of the specific personnel requirements of tax authorities for different areas and the implementation of the recruitment, transfer, and advancement of the personnel following these requirements are intended providing that the human resource management starts with the selection of personnel.

Table 4. Work, employment and vulnerability

Work, employment and vulnerability	2017
Employment to population ratio (% ages 15 and older)	62.8
Employment in agriculture (% of total employment)	37.4
Employment in services (% of total employment)	48.5
Labour force participation rate (% ages 15 and older)	66.1
Labour force participation rate (% ages 15 and older), female	62.9
Labour force participation rate (% ages 15 and older), male	69.5
Old-age pension recipients (% of statutory pension age population)	81.1
Unemployment, total (% of labour force)	5.0

Unemployment, youth (% ages 15–24)	13.7
Vulnerable employment (% of total employment)	56.1

Results, Conclusions and Recommendations

The measures on increasing international exchanges upon the organization of effective employment, using labor resources in the country based on modern modeling principles, and creating all conditions for increasing economic activity are being expanded. An intensive phase of the development of entrepreneurship, in particular of small and medium-sized businesses, as well as economic incentives and promotions of individual employment activities, is being observed (Order of the President of the Republic of Azerbaijan 2011).

Realization of reforms in the field of education, implementation of works on raising the educational level, implementation of measures for the formation of the modern vocational education system, closer attention and investment into human factor development, and the processes of searching for adequate mechanisms of human capital development at the level of contemporary requirements are widely covered by organizational and economic mechanisms. Workplace and work conditions are the factors increasing the quality of human resources use, moreover, measures for their improvement are characterized as one of the more emphasized areas in modern practice. Also, the efficient use of human resources is now regarded as one of the key indicators of socio-economic effectiveness in society. However, there is still a need for several tasks to be implemented in the field of improving labor organization in permanent workplaces that are considered to be one of the main directions in the efficient use of human resources in our country. The researcher, S.Gurbanova notes that the experience of foreign countries and advanced enterprises of the country should be used in the evaluation of workplaces. Today, the issue of the organization of workplaces is not scientifically approached and is not economically, sociologically, psychophysiologicaly justified. In modern conditions, the effective organization of the workplace, the effectiveness of workflow and mobility, training, the evaluation of criteria for workplace designing and coordination, the development of contemporary methods, investigation of the measures on improving the workplaces, assurance of their application in labor and production processes have become very important problems and all of them should be solved on a large scale in the country (Qurbanova S.Ə., 2007; p-27). All of these problems and issues make actual the tasks of setting up more modern and up-to-date technology-based labor mechanisms, workplaces, and working conditions to increase the effectiveness of human resources use in the country. The most effective ways to increase the efficient use of human resources are to allocate the worker in the workplace following his/her activity and abilities, to optimize the human activity in terms of scientific-economic and practical realities, and to provide productive mechanisms, as well as to normalize their activities optimally. Factors that hinder the realization of human potential should be taken into account, barriers should be eliminated, and the condition enabling to unravel the individual's creative and skill elements in the operational processes should be established. The measures on developing and forecasting the scientifically-economically-driven models and methods should be undertaken in the improvement processes of the labor market. In this case, the justification and benchmarks of the measures taken should be coordinated with the most effective utilization of the human factor (Ганбаров Э.И., 2007; p-20). Also, improving the existing labor market structure in the country with the view to improve the efficiency of human resources use, providing new methodological approaches to the organization of the use of human resource potential, identifying and applying models based on world practice in this field could be useful (Tahirova G.İ., 2010; p-20). On the other hand, such the issues as the organization of human resources in decent workplaces in our country, high level of organization of activities in enterprises, firms and companies operating based on scientific, economic and world experience are waiting for their solution. It is no secret that sometimes there are more candidates for a decent workplace, that is, a vacancy, requiring definite training and intellect, in our country. Enabling the use of a few of these human resources having such qualities in optimal conditions does not allow the efficient utilization of the resource potential, the resource potential that can provide additional potential for the sustainable

development of the economy and society remains unused, etc. Despite the low level of unemployment in the country and the formation of highly qualified human resources, the ability to model human resource use based on high level, efficient methods and productive mechanisms are limited. A large number of highly qualified human resources, formed with the help of large companies and enterprises operating on large projects with the foreign capital, especially modern administrative managers that are of importance for our country, are not able to use their potential in a permanent and reliable way, with the help of large companies and companies operating on large projects. After the completion of large-scale projects carried out for several years, the activity of full-fledged, highly qualified human resources becomes limited, and they have to pursue a long-term job, often being forced to agree on less qualitative and underpaid works because of material need. All of these make it necessary to create decent and sustainable workplaces in our country, to develop business and entrepreneurship entities based on long-term business principles and apply relevant mechanisms. Soon we deem it to be appropriate to summarize the necessity, tasks, and ways of increasing the effectiveness of human resources use in our country as follows:

- criteria providing a systematic and comprehensive approach to "human resources" understanding in the country should be updated and the relevant legislative framework should be improved;
- existing labor laws and normative documents should be adequately upgraded and, if necessary, revised to effectively model the use of human resources in the modern era based on the concept of "human factor";
- establishing and developing a fair competitive environment in different sectors of the economy, entrepreneurship and business should be ensured, and some of the revenues from oil exports should be directed to the development of the human factor;
- considering the needs of the labor market, the regulatory mechanisms for the preparation of highly qualified human resources and their effective use should be applied;
- for the quality improvement of human resources and increase of their economic activity, the development and implementation of a balanced state economic policy, including the development and implementation of a new model of effective use of human resource and effective employment policy should be provided;
- assimilation of systemized knowledge, skills and habits, and additional education should be provided, learners should be trained for social life and effective labor activity;
- the human capital that is necessary for modernization of the country should be developed and thus the international competitiveness of the Republic of Azerbaijan should be enhanced and so on.

Rapid progress in the world processes shows that new information sources and technologies are emerging, and trends are constantly changing. This creates the need for employees to keep up with changes and innovations and constantly improve their knowledge and skills. Therefore, our expectation is the continuous increase in the qualification of our employees. The process of increasing the qualification should gradually pass into voluntary form; employees should be interested in self-development. For this, their motivation should be strengthened and new incentive mechanisms should be developed. The works implemented in the sphere of human resources management should be organized as result-oriented, and resources expended for the development of human resources should be adequate to the outcomes we have achieved. Therefore, it is essential to ensure a high return on "investment" in human resources development.

Lifelong Education in Business: Role of Simulation Games in the Teaching Process

SEVAR MAMMADOVA

Ph.D. Azerbaijan State University of Economics (UNEC), Business School

Department of "Economics and business administration"

E-mail: sevar_mammadova@unec.edu.az

Abstract

The significance of business simulation games (BSG) rapidly increases. And this quite understandable. Because simulation games are based on the model playback mode realistic processes, events, locations or situations. The necessity of BSG in the educational process can be explained on the one hand by the growing demand of the labor market in specialists with practical skills, and on the other hand by growing needs of students to be able to navigate themselves through unfamiliar situations and find their decision in a proper and responsible way, instead of blind copying teachers instructions. BSG offers a broad scope of the forms of competencies students such as an ability to work in group teamwork, find a common language and understand that is globally relevant and informed while providing space to adapt the framework to local contexts. Business simulation games train students create risk-free spaces where everyone can work out specific skills and feel the effects of own decision-making, requiring a certain level of risk. Entrepreneurial activity is pivotal to the continued dynamism of the private sector, as the generation of new businesses fosters competition and economic growth. This is particularly relevant for Azerbaijan, whose entrepreneurship and business innovation levels are low, and it faces a central challenge to create conditions that will facilitate growth in nonoil tradable sectors. Therefore the proposed paper has three objectives: development of teaching resources and tools for delivery of entrepreneurship education. BSG will facilitate strategic problem-solving in life-like simulated business environments and it will be attached to the existing UNEC incubator. BSG should become an integral part of the educational process. Simulation games allow students to practice and improve their entrepreneurial skills in a 'virtual' environment by making informed decisions and applying the knowledge and skills acquired in the class. According to OECD LEARNING COMPASS 2030, the educational process should be focused on evolving learning framework that sets out an aspirational vision for the future of education. The wider goals of education open new horizons of orientation towards the tomorrow we want to see. Thinking globally acting locally we will create collective well-being for every society's member.

Keywords: Simulation games, Entrepreneurial activity, Virtual environment

Introduction

In 1991 after the collapse of the USSR Azerbaijan restored state independence and became the country in transition that has inherited an inefficiently functioning system of a planned economy. Inherited Soviet high education service also fell into disrepair. Even though Soviet education had positive sides, such as free education, the strong reputation of exact sciences, high-quality technical education, motivating factor of enlightening, this system also had its flaws. The most and the worse one was the fact that the key place in the higher education system was occupied by theoretical knowledge instead of a practical one. Besides, there was a very low demand for learning foreign languages, software development and programming languages, which became a barrier to integration into the global education system. With the collapse of the planned economy, the country began a transitional crisis, which of course has also affected the activities of higher education institutions.

New reforms in the education system of Azerbaijan began since the early 1990s. However, there were difficulties associated with the lack of a legal framework for education. There was no law on education, baccalaureate, and magistracy, the credit system was also absent. Digital teaching staff skills were extremely poorly developed. Even though Internet media appeared in Azerbaijan in 1996, there was no digitalization policy in the country, teachers did not know even how to use a computer. It took a long time and was quite difficult to

penetrate people's mind, explain them the role and essence of e-learning and digital possibilities on the way of quick and easy search of needed materials.

In the context of globalization, one of the main tasks of the educational system in Azerbaijan was to integrate into the European educational system, along with the creation of a competitive educational system capable to meet the needs of the global labor market. This task became even more urgent when in 2001 Azerbaijan became a member of the Council of Europe. The integration of the national education system and implementation of European education standards have become the main and priority goal of the newly obtained a sovereignty Azerbaijan.

To achieve this goal, it was necessary to create national educational standards, determine the possibilities and advantages of the Bologna credit system and its appliance in Azerbaijan.

In 1999, after the approval of the main educational reforms, comprehensive changes began in the entire educational system of Azerbaijan. In 2005, an official document on the inclusion of Azerbaijan into the Bologna system was signed. The theoretical and legal basis of the process was set out in the document "The Structure of Minimum State Requirements for the Level and Content of Bachelor's Degree adopted in 2006". By joining the Bologna system, Azerbaijan automatically assumed obligations to further improvement of education quality, as well as to adapt its educational system to the advanced educational systems of European countries and accepted several other commitments to deal with. The country for sure faced a need for fundamental reforms in higher education. Structural changes were made to the higher education system, new specialties and subjects in computer science were added to the curricula. However, the transition to a new system did not solve all the problems associated with higher education in Azerbaijan.

The usage problems of digital technology still exist in the education system. Since the ICT industry is constantly developing, computer knowledge must constantly be improved too. Azerbaijan State University of Economics (UNEC) like other universities of higher education often have a lack of advanced experience, qualified specialists in the field of digital technology.

Creating a digital environment at UNEC require an appropriate digital concept, the training of specialists, who will use modern digital technologies and then provide training for trainers, transfer new knowledge students and thus develop a great value for a new generation.

Effective education at business schools should be oriented on designing of simulation games that will be very useful and requested from the labor market. To be able to meet the main requirements of the business world each institution has to look for suitable methods to providing not only theoretical basis but also mainly practical skills and should guide students to creative, logical and innovative thinking. Designed for a business student's Business simulation games (BSG) is an effective educational tool today because games allow you to simulate various economic occasions and conditions in the market and motivate students to personal decision-making.

BSG are active didactic tools used in teaching Economics, Marketing, Management, HR, Procurement and other disciplines and considered learning methods designed on empirical learning. They encourage students to obtain new knowledge and skills through experience. Playing on BSG, students may check and forecast the short-and long-term impact of economic indicators on the business, and then check and correct their decisions if needed.

This paper aims to emphasize the importance and efficiency of business games in the modern learning process. The BSG invites students to be innovators even virtually because they will see opportunities for local

developments, use engineering achievements to design new products/services. Student investigations such as surveys, different forms of collaboration, interviews can be very interesting for local entrepreneurs.

Method

Experiential and Action Learning Pedagogies, Case Method Teaching, Design-thinking, problem-based learning.

1. Theoretical view

The BSG have been widely used in most universities since the second half of the 20th century. The use of BSG at business schools as a learning tool becomes very popular nowadays. According to Faria about 95% of the all business schools united within the framework of the American Association to Advance Collegiate Schools of Business known as AACSB International included simulation games in their curriculums. The leading universities of the USA, Canada, France, Great Britain, Australia, New Zealand, Turkey, the United Arab Emirates, China, Singapore, Taiwan, South Korea, India, and Lebanon are members of this association. Is this the secret of the successful adaptation of companies in these countries to the changing global business environment? As we can see, none of the CIS countries are members of this association. Is this the reason for lagging behind the trends of the world market?

In most cases, new businesses fail. But most of those failures are preventable. And we consider that learning students by playing simulation games in a virtual competitive environment can orient and focus them to think comprehensively and practically, weigh the pros and cons before making a decision.

Development of ICT and computer sciences has created a wide platform for holding practical lessons using digital business games. Simulation games can incorporate various management-related disciplines such as marketing, accounting, HR, corporate social responsibility, procurement, entrepreneurship, logistics, and others. Thinking and acting entrepreneurially can and should be taught in classrooms.

1.2. Learning process

The simulation is digitally based and doesn't need to install a special application and can be generally recognized from the existing computer that has access to the Internet. The simulation base encourages team participants to work collectively. Each member of the group is given an account that allows them to make decisions create various situations on their own. To be able to make the right decision all results should be combined with findings of other teams. The web-designed platform should obligatory include web-forum to communicate with every team in the on-line market. Business simulation games train students and managers create risk-free spaces where everyone can work out specific skills and feel the effects of own decision-making, requiring a certain level of risk.

The main characteristics we can give as followings:

- Reality
- Risk control
- Skills training (practice new behavior)
- Feeling and understanding the consequences of their own decisions.

We can imagine the learning process as given on the fig. 1.

Students will be given a basic set of learning materials and tasks and a fixed time to create and design their decisions. To be able to manage virtually a fully integrated company and start a business student will be given the conditional seed capital. The whole class will be divided into teams and every team will have a chance to earn money in a virtual environment. In the process of BSG, they can hire and dismiss from work employees, open affiliated offices and then close them if it is necessary.

For a brief demo of the strategy and business policy simulation, please go to <https://www.marketplace-simulation.com/strategy-business-policy-demo>

A brief demo of the BSG can be observed at the <https://www.marketplace-simulation.com/strategy-business-policy-demo>
A teacher of strategic management has to use a combination of methods like lectures, videos and case studies to impart learning. Learning through case studies is better than listening to lectures or videos. The role of the decision-makers allows students to think pragmatically and practically and this is undoubtedly the most effective tool for learning. The scope of interesting issues may touch such questions as what strategies can be used to occupy market niches? what changed? what was lost? And etc.

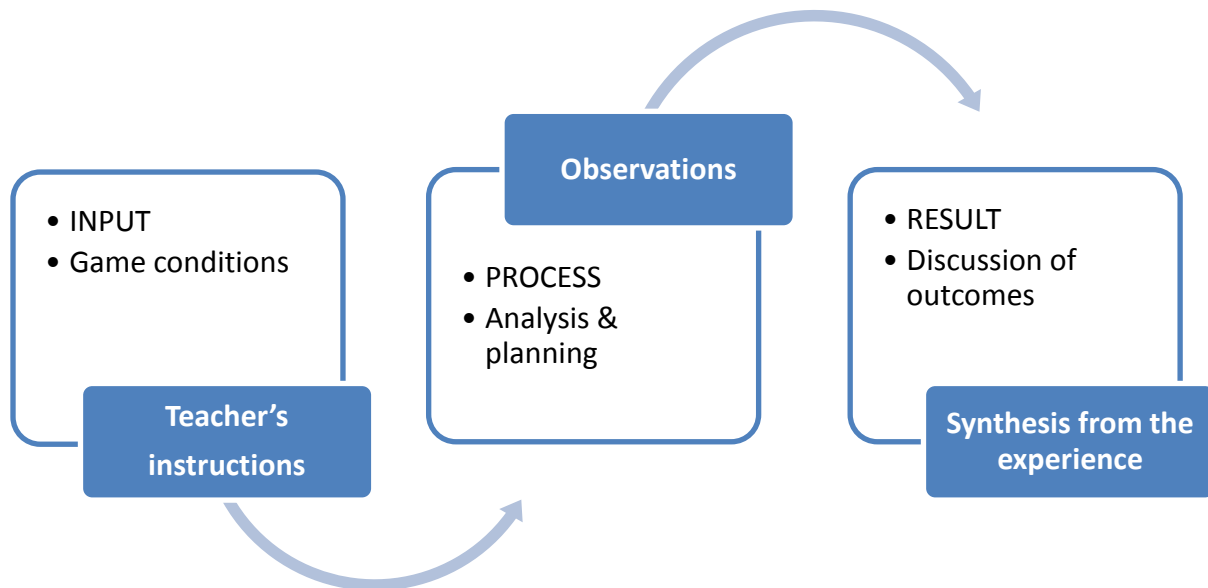

Figure 1. The main stages of the learning process through BSG (compiled by the author)

Entrepreneurship Educators have to be equipped with approved and tested concepts and technical tools to teach experientially. Experiential and Action Learning Pedagogies, Case Method Teaching, Managing Classroom Challenges, Curriculum and Course Design, Use of Technology in the Classroom should be provided too.

Anyone who wants to be educated based on the action will receive the benefits of entrepreneurial education. No matter what discipline you're from, if you're an academic or an entrepreneur who teaches or has a desire to teach entrepreneurship, you'll leave the program prepared to pass along the benefits of entrepreneurial education. Participants come from all around the world, allowing for a diverse group of peers in the program.

To be able to provide continuous learning process on the base of simulation games universities should recruit and train mentors and coaches. Findings of this study may help teachers in the designing of curriculum that will include BSG and a mechanism of their providing.

2. Motivation for the BSG

To be able to counter the competitive labor market, higher educational institutions should include into the teaching process BSG. Students after graduation not always enough to ensure a job. Every employee requires an experience from a young candidate.

It is obvious that getting an experience at universities not an easy task because it is not always possible to study full-time, some of students have work on the side, not all universities can provide and know how to play BSG. According to Crookall (2010a) we would not fly with a pilot who was not thoroughly trained on the simulator before he or she is allowed fly on airplanes.

To be able to provide continuous learning process on the base of simulation games universities should recruit and train mentors and coaches. Findings of this study may help teachers in the designing of curriculum that will include business simulation games and a mechanism of their providing.

Aram and Noble (1999) notice that “business schools are not adequately preparing students to understand and cope with the levels of ambiguity and uncertainty they will inevitably face when they take up positions in organizations. They [the authors] believe that this is because the models of teaching and learning that dominate academic practice are those that are appropriate to the stable, predictable aspects of organizational life and do not include the paradoxical and unpredictable characteristics of the professional business environment” (Aram, E. and Noble, D., 1999, as cited in Lainema, 2000, p. 1 of 14).

Copenhagen Business School (CBS) has successful practice, namely introduced BSG into the teaching process on bachelor’s and master’s degrees. (Löfvall, S., Email communication, June 23, 2011). Despite advantages of BSG, CBS first evaluated its suitability through a successful pre-testing of HotelSim in fall 2010. Test gave a positive results. Each university can follow this practice and increase the number of listeners with regard BSG. Students can implement their capstone projects combining theoretical knowledge with simulation games, provide research on a sample group from a higher educational setting and etc.

The important task for the Azerbaijan economy is to promote growth in the nonoil tradable sectors. Azerbaijan’s economy has developed around its strong natural resources base, which accounts for over half of gross domestic product (GDP) (figure 2.1) and 90 percent of exports. Although Azerbaijan has experienced rapid oil-driven growth over the last decade, this has not spilled over systematically into other areas of the private sector. Nonoil growth has been dominated by nontradable sectors led by construction, which accounts for about 60 percent of nontradables

Students are provided with the seed capital to start up their business. They will be a totally integrated company that does it all from marketing to production to human resource management. They will have limited financial resources and complete accounting responsibility. They will build a factory, open sales offices and launch a website, design brands and advertising campaigns. They will hire salespeople and decide on the compensation packages, deal with demand projections and a simple production scheduling process. After several quarters in business, students' firms will be able to receive additional funding from the venture capitalists by making a presentation of their business plan and negotiating with the interested venture capitalists. They will invest this money in new R&D, bring out improved products, and expand their distribution and production capacity in order to maximize their performance

Conclusion

The important task for the Azerbaijan economy is to promote growth in the nonoil tradable sectors. The number of acting small and medium entrepreneurship subjects will grow if they play simulation games without fear of losing their capital. BSG may become a very important tool and make a significant impact for increasing the employment in the labour market and also to the development of SMEs in Azerbaijan. According to Internet World Stats organization the number of the country’s Internet users exceeds 7,531 million people or 75,5 % of the total population. Thus we can say that e-educated students will contribute to the the national wealth of the country.

Recommendations

The main recommendations are as follows:

1. Inclusion of BSG into the curricula in the sphere of high education is highly recommended. For this reason, the relevant experience of the world leading universities can foster UNEC and other institutions from Azerbaijan to integrate into the modern education system.
2. BSG will push the game participants to be capable in making own decisions in the future in real conditions, develop an ability to make quick and efficient decisions, track the dynamics of the current and future business trends and predict expected final outputs.
3. Learning by playing, imitation of the real conditions will make students more savvy and in demand in the modern labor market.
4. Using BSG will bring benefits not only the students, but also for teachers of the business schools. As a moderator teachers have the leading role that means that they define the main conditions of the game. Teaching based on gaining empirical experiences through BSG makes the learning process quite interesting and entertaining. Students see a teacher as a trainer, who is ready to help them to reach their goals.
5. The demand for universities that will conduct business simulations will be much higher among applicants, and this is a guarantee of a high rating of the University among educational institutions.
6. Summing up I would like to recall the words of Confucius – “I hear and I forget, I see and I remember, I do and I understand”

Abstract

"Educational Migration" is quite common in Georgia, as it is one of the fastest growing migration. Therefore, studying this type of migration, making relevant conclusions and developing recommendations is more important in the modern stage. Therefore, quantitative analysis of educational migration is the main goal of the article. Hence, quantitative analysis of educational migration is the main goal of the article. The average cost of a foreign student is 7,733 dollars (the cost of living, leisure, travel and other expenses), or 195 million GEL per year (USD -2.7 GEL), which is 0.6% of GDP and 6% of service exports. By According to the forecast, the number of students in 2020 will be 20 thousand and the income will be 0.5 million GEL. Economic benefits will be further increased by improving teaching quality and service.2020 the number of students will be 20 thousand and the revenues will be 0,5 million GEL. Economic benefits will be further increased by improving teaching quality and service.

Keywords: Migration, Students, Education, International mobile, Statistics.

Introduction

Today the globalization has become a crucial issue in the everyday political, economic or social and cultural life, (Quliyev, A., Abesadze, N., Abesadze, O. Amanova L., 2019, pp.51) especially when the foreign interests of Georgia include sharing with the advanced European values and experiences and joining the European Union (Abresadze, 2014). On this background, the education system in many countries around the world does not respond rapidly to the rapid change of knowledge and technology that forces young people to take abroad. In scientific literature, the term "educational migration" is quite often found today, as it is one of the fastest growing migrations. Therefore, its study and quantitative analysis are, of course, more important, in the context of relevant information provision. Within the background of the globalization processes taking place in the world economy, one of the principal preconditions for the development of Georgian economy is the availability of highquality statistical data depicting the integration processes. This, surely, means the perfection of the activity of the National Statistics Office and its maximum harmonization to the international standards (Abesadze, N.2015pp.333). This puts forth new challenges to the National Statistics Office.

The main reason for the emergence of educational migration is the adoption of adequate education in the modern stage of economic development and, consequently, the competition on the labor market. Educational migration is an exemplar of migration, the distinguishing feature of which is the voluntary, short-term, predetermined time and life of the age group defined by abroad. Today, a very large number of young people choose education outside their country. According to the growing demand for education abroad, "Mobility students" start searching for new directions to get higher education outside the boundaries of the country. With the increase of the number of people abroad year by year, universities all over the world are struggling to mobilize the best and most talented people. But it also increases the growing competition between students of developing countries in terms of learning more accessible and appropriate learning programs. Increase in the segment of international mobility students increases the number of applications applicants and students enrollment in the world universities.

Today it is possible to prove that the World Education Service market is established and the largest volume of services in this regard is conducted by higher education organizations. That is why they promote the most important flows of educational migration. Many state and educational institutions are trying to attract foreign students, advertise their own programs, create certain conditions for learning and organize training exhibitions in different parts of the world. Competition is becoming increasingly aggressive in this direction and plays an important role in this fight. But this is not the only choice for young people. Based on this literature the main goal of the work is to reveal the main trading trends between Georgia and Azerbaijan.

Method

In the article is applied qualitative and quantitative methods of data analysis widely accepted in economic science (Gelashvili, S., Abesadze, N., Abesadze O., 2015:37): the methods of statistical observation, grouping and analysis were used in the research process. The graphical expression method is widely used. In addition, the methods of induction, deduction, analysis and synthesis, selective observation were used in the research process. Comparative indicators of the structure, dynamics, comparison were calculated.

Findings

As it is known, educational migration is the movement of people to get education outside their country. This kind of migration allows young people to discover new opportunities, the latest technologies, world culture, quality education, and international labor markets. And this is a very important thing for a young man who chooses to choose his own way of life and whose lives are starting now. Foreign students - these are temporary migrants who take abroad, the predominant, medium, and others. Kind of education. According to the prevalent opinion, people prefer education abroad because they do not allow their environment to get the desired education. They choose education in countries where their preferred educational establishment is.

According to UNESCO's Institute of Statistics, (Global migration indicators. 2018) the number of international mobile students in the world has increased by almost 70% over the last 10 years and exceeded 4.85 million by 2016 (see Fig. 1). Along with stabilizing the number of foreign students, internationalization of education plays a crucial role in modern education systems.

Chart 1. Number of foreign students (mln man) 2011-2016

Source: Data of UNESCO

In Georgia, according to the level of education in 2018, the number of foreign students in the last years has increased significantly in the last years and it is ranked 26th among 189 countries worldwide. (United Nations Development Programme: Education Index 2018 (see Figure 2).

Chart 2. Number of foreign students in higher education institutions of Georgia in 2008 / 2009-2018 / 2019 academic years.

Source: National Statistics Office of Georgia

As shown in the graphic image, if Georgia hosted 499 foreign students in the 2008/2009 academic year, more than 12 thousand students study in the country by 2018/2019 academic year and 21%, And increased 23.5 times in comparison with the 2008/2009 school year. Over the years their number increased by 1173 students.

90% of foreign students in Georgia are citizens of Azerbaijan, India, Iraq, Nigeria, Turkey and Russia. In addition, the number of students in Azerbaijan, Iraq, India and Nigeria has increased significantly in recent years, while the number of Turkish and Russian citizens is relatively stable.

Table 1. Foreign students in Georgia according to the countries of 2008/2009 -2018/2019 academic years.

	2008/ 2009	2009/ 2010	2010/ 2011	2011/ 2012	2012/ 2013	2013/ 2014	2014/ 2015	2015/ 2016	2016/ 2017	2017/ 2018	2018/ 2019
Azerbaijan	86	229	135	280	583	860	1372	2388	2650	2702	2124

Russia	84	77	232	124	191	167	157	253	249	257	306

Source: National Statistics Office of Georgia

According to Geostat data, 10074 foreign students were studying in Georgia in 2017/2018 academic year. Of them, 3 650 state and 6 413 private schools are studying. The largest number of foreign students - 3 834 students from India, 2 702 from Azerbaijan and 821 students from Iraq.

As for the 2018-2019 academic year, 12234 foreign students study in Georgia and 5830 of them are still from India and the growth rate is 52%. While the number of students dropped from Iraq and Azerbaijan to 8% and 21% respectively. It is interesting to note that in 2011/2012, 49 students from Nigeria studied in Georgia, the number of which is growing annually and increased by 6.5 times (366 students) for 2018/2019 academic years. The majority of foreign students have been selected by Tbilisi State Medical University for several years already. However, in recent years the number of foreign students has increased significantly in the University of Georgia and Caucasus International University. Most of them think that learning in Georgia is because of a safe country and a living in comparison to other countries.

According to the Ministry of Education and Science of Georgia, the absolute majority of foreign students (95%) in Tbilisi study in Tbilisi, 2.2% in Kutaisi and 1.8% in Batumi. Medical education, which is most expensive, is particularly popular among foreign students, half of which takes education in medicine, health care, pharmaceuticals or dentistry, almost a quarter studying at the faculty of business, economics or law. European students are mainly interested in studying Georgian art and history of medieval.

The 2017 report of the Government Commission on Migration states that one foreign student spends about \$ 7,733 (tuition fees, added life, vacation, travel and other expenses), or 195 million lari per year (published in the study, in November 2017, the dollar rate was 2.7 GEL) Which is 0.6% of gross domestic product of Georgia and exports of services 6%. (A short form of migration profile for foreign students in Georgia".)

As noted above, the number of those willing to study in Georgia increases from year to year, meaning that if by 2020, the number of foreign students may reach 20,000, which means it will automatically increase the country's budget revenue. If we define the same rate, it will be half a million. Based on simple calculations, it may be possible to cover the expenses incurred by foreign students in order to study in Georgia by foreign students.

It is an interesting study conducted by the Tbilisi State University International School of Economics (ISET) Migration State Secretariat ordered and the European Union and the Migration Policy Center for International Development (ICMPD) managed the project - "Migration Management in Georgia" (ENIGMMA), the aim of the economy on foreign Students were found to influence rate. According to the research, Georgia plays a key role in attracting foreign students in Georgia as a reputation for a safe country and a low cost of learning, while choosing a particular university, access to English language courses, qualification of academic personnel and paying attention to teaching fees. Most of the interviewed students (89%) state that they are financially dependent on their families remaining in their homeland. Azerbaijan's students have the smallest financing, while the largest - Iraq (yearly, 2157 and 9985 dollars). The largest share of student expenses is the study fee (38.88% of all expenses), on average it is 4777 USD according to all university. (ISET Online Survey, 2016)

In addition to economic benefits, internationalization of education increases the awareness of the country, and even after the students return to their countries, they will still continue to have a relationship with the state where education is taken. At the same time, some advertisements will be made on the continuation of studies in Georgia. It is noteworthy that a vast majority of foreign students are planning to get education in Georgia and leave the country, which will have their future impact on the labor market largely negligible. 65% of foreign students plan to continue their studies after completing their studies, including 8% in Georgia. Less than 30% thinks about employment after learning, including only 5% going job search in Georgia. (ISET Online Survey, 2016). The latter indicates that the influence of foreign students is largely short of the Georgian economy and is limited to what the students are studying in Georgia, which certainly reduces the potential long-term effects of foreign students on the country's economy. In order to stay in Georgia or continue to work, what the data indicates will further increase the economic benefits received by foreign students. This will facilitate improvement of teaching quality and service in universities. It should change the legislative framework, increase the autonomy of universities and increase the internationalization of academic programs, and create more foreign language programs. Besides, it is very important to support the state, even in terms of granting student visas. Without a united approach of the state, environmental conditions and infrastructure that will make international students come and make learning easier and more attractive. Strategy and Action Plan will also be set up in order to increase the number of international students, as well as the platform Study in Georgia, which helps international students and universities to connect with each other.

Results, Conclusions and Recommendations

- Educational migration is important for Georgia.
- Number of foreign students is systematically growing
- 90% of foreign students in Georgia are citizens of Azerbaijan, India, Iraq, Nigeria, Turkey and Russia. In addition, the number of students in Azerbaijan, Iraq, India and Nigeria has increased significantly in recent years, while the number of Turkish and Russian citizens is relatively stable.
- The absolute majority of foreign students (95%) in Tbilisi study in Tbilisi, 2.2% in Kutaisi and 1.8% in Batumi. Medical education, which is most expensive, is particularly popular among foreign students, half of which takes education in medicine, health care, pharmaceuticals or dentistry, almost a quarter studying at the faculty of business, economics or law. European students are mainly interested in studying Georgian art and history of medieval and s.o.

Abstract

It is important that the products produced in modern times meet the quality and safety requirements. The implementation of these requirements is possible by taking precautionary measures into consideration and risk management that may appear at any point during the production process. Disregarding risks in any activity significantly reduces the competitiveness of the enterprise and the quality of the process and product. In world practice, many advanced companies have achieved profit and high quality products through a systematic implementation of the risk management process and then smaller companies gradually began to take advantage of their experience. The world's two most widely used International risk management standards are HACCP system and ISO 31000. High quality and competitiveness of the product depends on implementing requirements of these standards. Establishing a risk management system in enterprise and identifying potential risks minimizes losses, increasing profits and achieving high quality products with lower cost value.

Keywords: Risk management, International Standards, Requirements, Quality

Introduction

As the requirements for products of today's production are very high, it is also crucial that they meet both quality and safety requirements. The meeting of these requirements is possible by managing of risks that arise before the manufacturing process and that occur during the production process. To date, various international organizations from several leading countries have developed a number of international standard projects that allow the to make significant progress in assessing the potential risks in production, economy, construction, medicine and many other areas, by minimizing or eliminating their potential negative impacts. The risk management process and the broad disclosure of this approach are included in the requirements of these standards.

The process of Risk management is a comprehensive, extensive and important process. The implementation of this process should comply with the requirements of relevant regulatory and technical documents, each stage must be regularly documented, based on a predetermined plan, and all changes should be noted. Thus, these notes prevent the loss of time during the relevant assessments. Numerous standard projects, guidelines and regulatory and technical documents covering the risk management process have been implemented in various parts of the world so far. It may be an example of AS / NZS 4360: 2004 – in Australia and New Zealand, CSA Q 850: 1997 - in Canada, JIS Q 2001: 2001 - in Japan [1], [4], [12] . Later, these standards have been summarized and a single standard was prepared from those standards and applied in the food industry. It was HACCP system principles and nowadays these principles and ISO 31000 are the most widely used standards in risks management field.

These standards envisage taking appropriate measures to identify, assess, and eliminate the existing risks. Standard requirements also include early warning of potential risks and preparation of a precautionary plan in case of appearing new risks.

To ensure the effectiveness of the risk management process in any field of action, it is necessary to pay attention to the following four questions of general character:

1. *What can happen?* Specific attention is paid to the detection of potential risk when examining the answer to the question.
2. *What is so important?* (evaluation). Depending on the outcome of the first question, management should make assessments and make decisions about whether the various outcomes are desirable or unwelcome.
3. *What can be done?* (action). As a next step, management should prepare a plan for managing potential risk in one or another way, minimizing risk, and avoiding risk. In some cases, it is also important to have a reserve plan that can be applied during an unexpected event.
4. *What happened?* (analysis). At this stage, the management should determine whether the expected effects have been achieved by analyzing the outcomes of the work already done and whether there is a need for additional changes. All of these should be accompanied by an effective exchange of information with those who may be in danger of risk and may be able to assist in the fight against risks.

The application of the risk management system in enterprises and organizations and registration and maintenance of records of this process has the following advantages:

- arranging assessment of risk-related approaches within the organization;
- revealing the strengths and weaknesses of the organization's risk management system in terms of standards;
- developing key documents for the corporate risk management system;
- preparation for risk management process and reducing costs for the process;
- making appropriate changes to the organizational structure;
- avoid the negative consequences of possible risks, fully or partially.

Overall, risk descriptions of general risk indicators in risk management system are given in Table 1.

Table 1. Description of the risk management in the risk management system.

1.	Risk name	Risk determination
2.	Risk area	Description of events, dimensions, types, quantities and impact areas
3.	Type of risk	Strategic, operational, financial information, compliance with legislation
4.	Interested parties	Interesting parties and their expectations
5.	The amount of risk	Importance, probability, results
6.	Suitability of the risk	Possible losses and their material costs
7.	Risk management and control mechanisms	Value of risk
8.	Opportunities for improvement	The risk management objectives and the desired level of performance of the assigned tasks at any level
9.	Strategic and management changes	Existing methods / experience of risk management

Regardless of the area of activity, production volume and size, enterprises and organizations set specific objectives and goals when they start operating. when it commences. The effects of internal and external factors that prevent them from determining how and when they achieve they goals and objectives they value are assessed as "risk." Businesses and organizations can only make this objective more realistic by taking into consideration the risks that may affect the outcome on the road to that end. The concept of "risk management" is used to avoid the risk of negative impacts or to eliminate them. Risk management covers all processes related to risk identification, assessment and decision making, risk reduction or pre-requisite review, as well as monitoring and analysis, communication and consultation.

Risk management is important for businesses and organizations, and this process should be carried out step by step in a systematic way. The main purpose here is to completely or partly avoid the negative effects of risks to the organization and its image, the quality of its products, the position of the product in the local and foreign markets and the health of consumers of these products.

In order to implement the risk management process, activities such as establishing a risk management system in enterprises and identifying potential risks, preparing the necessary documents and procedures, taking into account the estimated risks and implementation of a reserve and corrective action plan are applied. Here, also, the quality of

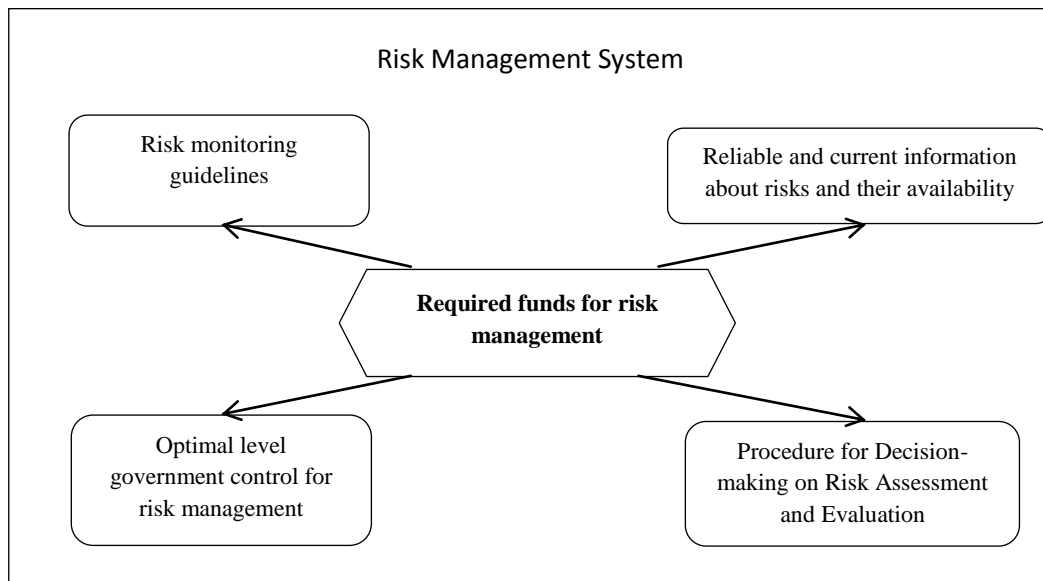

Figure 1: Risk Management System and The funds required for this process

the risk management process itself is measured on a regular basis, and the negative aspects of the process (if any) are corrected. The main purpose of the risk management in the enterprise is to minimize losses, ensure the safety of the work process and maximize the revenue. The list of funds required for risk management in enterprises and organizations is given in Figure 1.

1. International Standards and Risk Management

A number of standard projects have been developed by international organizations that make significant progress in managing the risks in production, economy, education, transportation, medicine, and many other areas. Gradually, these projects have been tested and implemented by different enterprises, and the problems have been solved and projects have been improved. These normative documents have been renewed over time and new versions have been widely used in modern times. The HACCP principles of the above-mentioned standards are used only for the management of risks that may arise in every area of human activity, including the production of food products, and the ISO 31000 standard for food production. Some countries have drafted and implemented number of standard projects that was prepared by harmonizing national standards with some of these international standards. [9] - [12]

The requirements of International standards for risk management indicate that regular monitoring is the most important action to ensure that the processing plan is consistent and adequate. Each stage of the risk management process, including the proposals applicable methods, data sources, analyzes, results and reasons for the decisions taken must be documented and noted. [14]

1.1. HACCP system principles

The main principle of applying the HACCP (Hazard Analysis and Critical Control Points) system is to conduct a thorough analysis of risks and to identify critical control points. The application of the elements of this system in the

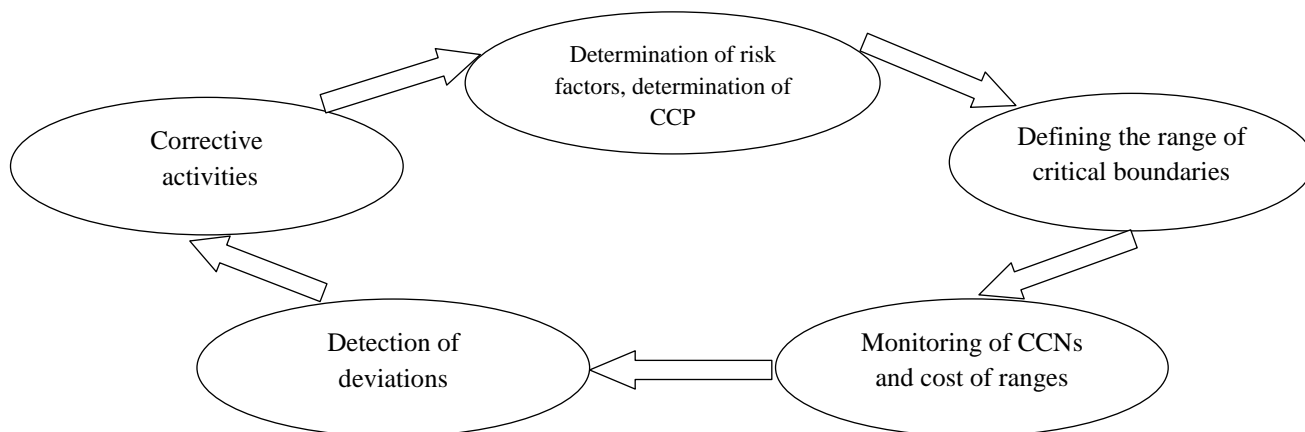

Figure 2. Periodic scheme of risk management, based on the principles of the HACCP system

production envisages control of the risk at any point in the production activity and the implementation of the necessary measures. HACCP is a food safety management and risk management system, primarily a warning system that systematically detects, evaluates and controls potentially hazardous factors that may arise during production [5]. These factors are biological, chemical and physical risks.

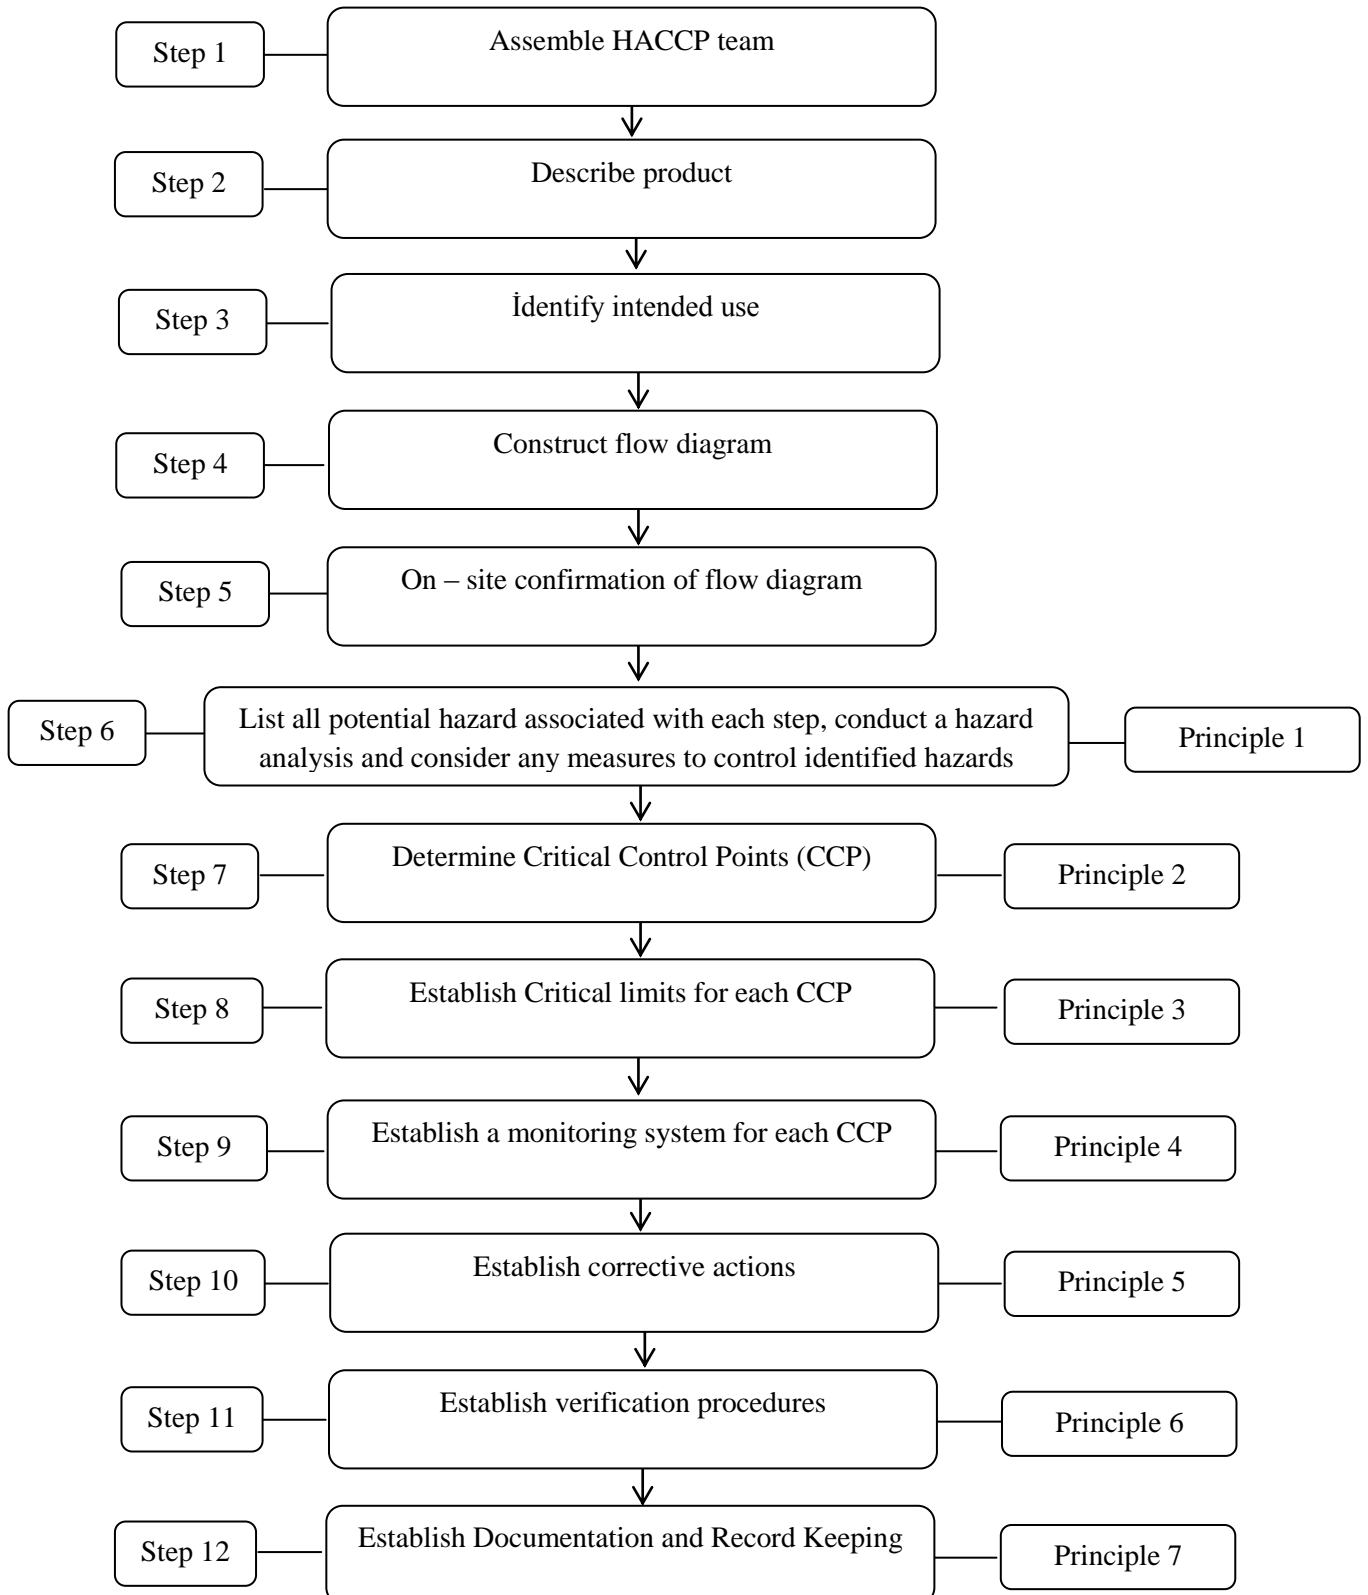

Figure 4. Stages of application of the HACCP system and its 7 principles

For the first time, the HACCP system was designed to provide safe nutrition for astronauts in NASA in the United States in 1960 [11]. The principles of the system that self-sustained in this field have gradually been studied and applied by ordinary manufacturers acting in different countries over the world. The principles of the HACCP system are designed exclusively for food manufacturers and so far, many researchers have conducted assessments before and after the system's application to determine the benefits of its application. The results are almost identical: the application of the HACCP system elements ensures the safety of foodstuffs, the protection of consumers' health, and the control of critical control points by monitoring the entire production cycle of produced products.

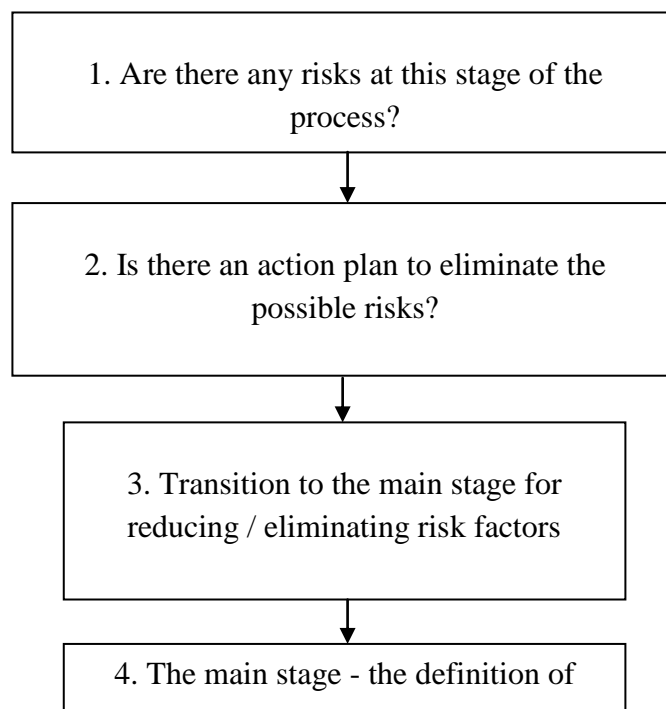

Figure 3. The sequence of Critical Control Points (CCN) assignment

The main objective of the HACCP system implementation is to provide a high-quality product, to provide comprehensive security controls that ensure safety in all the rings of the food chain, and educate personnel involved in this process through training. This system has emerged as a result of systematization of pre-existing world-class safety requirements and has been widely used by leading countries, many secular alliances, and have been widely used [4]. The HACPP system also requires proper documentation of all processes, renewal of documents, accessibility for everyone, training of employees and management involved in training. For the introduction of the HACCP system, manufacturers should not only research their products and production methods, but also apply this system and its requirements to raw materials suppliers, supporting materials, and wholesale and retail trade systems.

1.2. ISO 31000 standard

ISO 31000: 2009 The "Risk Management, Guidelines and Guidance" standard includes the principles and comprehensive requirements for managing potential and existing risks including the indirect healthcare industry, so as to minimize their negative impact on the outcome (Figure 5). This standard was developed by the ISO Technical Guidance Group [3]. Although this standard provides generalized guidance, it is not intended to ensure uniformity of risk management across all organizations. When creating and implementing plans for infrastructure risk

management should take into account the different needs of a particular organization, its particular objectives, situation (context), structure, operations, processes, functions, projects, products, services, or assets and specific practices adopted In the organisation.

Until the end of 2015, national standards bodies in 57 different countries adopted ISO 31000 as a national standard for the risk management in their country. ISO 31000 is broadly accepted by many public and private companies, government owned, nonprofits, different charitable organizations and as the standard is not specific for any field of activity the list of its implementing by organizations and enterprises is quite large. Nowadays 2018 version is available and the main changes from first edition is given in figure 4. And while ISO was developing the 2018 version of this standard, was received over 5000 comments from over seventy countries [16].

A working group organized by ISO reviewed the existing normative and technical documentation as well as the best practices of New Zealand, Canada, Australia and other countries. Summarized by defining effective areas of work in the field of risk management. Thus, a new architecture was created that was ISO 31000, the latest terminology that has always been updated, and the necessary work has been done to ensure that the requirements of this standard should be applied to different cultures, enterprises and languages as easily as possible [8].

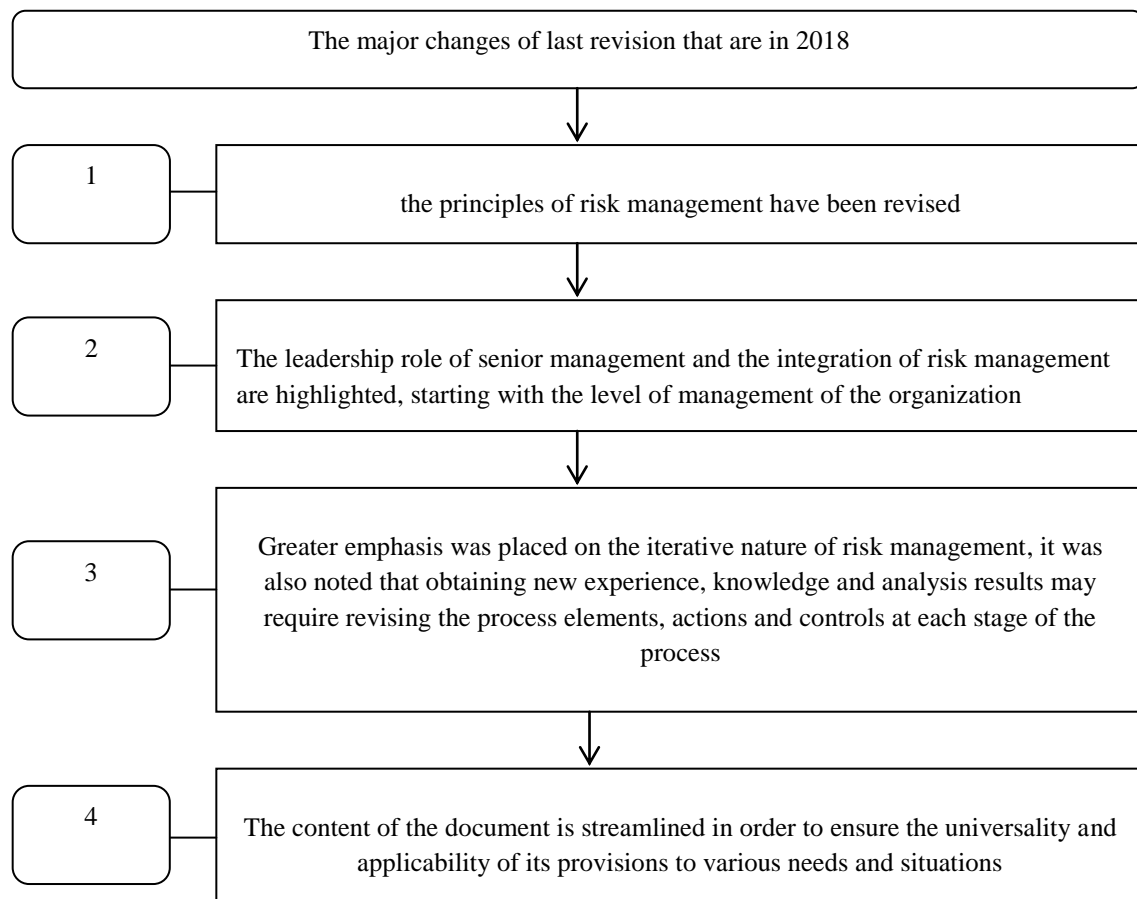

Figure 3. The main changes of 2018 version of ISO 31000 standard

ISO 31000 is the first international standard of risk management practice and was first published in 2009. The draft standard has been recognized as an internationally recognized document, with its very easy implementation rules and requirements, as well as examples of best practices in the field of risk management. The Working Group has developed ISO 31004 - Technical Presentation to facilitate the application of the standard in various enterprises and

organizations. The ISO 31000 standard, as well as other ISO standards, is revised every 5 years, and in the context of the requirements can be reviewed and necessary changes in the new version are offered.

The risk management process in enterprises and organizations is carried out according to the requirements of ISO 31000: 2009 standard [7]. Keeping contacts with internal and external stakeholders and arranging consultations are essential at all stages of risk management. Therefore, plans for communication and consultation should still be developed at the first stage of implementation of the standard, ie at the planning stage. This plan should cover direct risks, their nature, impact rate, their causes, and, if known, the measures taken to remedy such risks. When building a context, the organization explicitly identifies its objectives, identifies internal and external factors that will be taken into account when managing risks, and chooses the scope and criteria for the risk exposure for the remaining processes. Although many of these parameters have been considered during the risk management concept development, they should be re-examined during the context of the context and how they should affect the management process in any particular risk area.

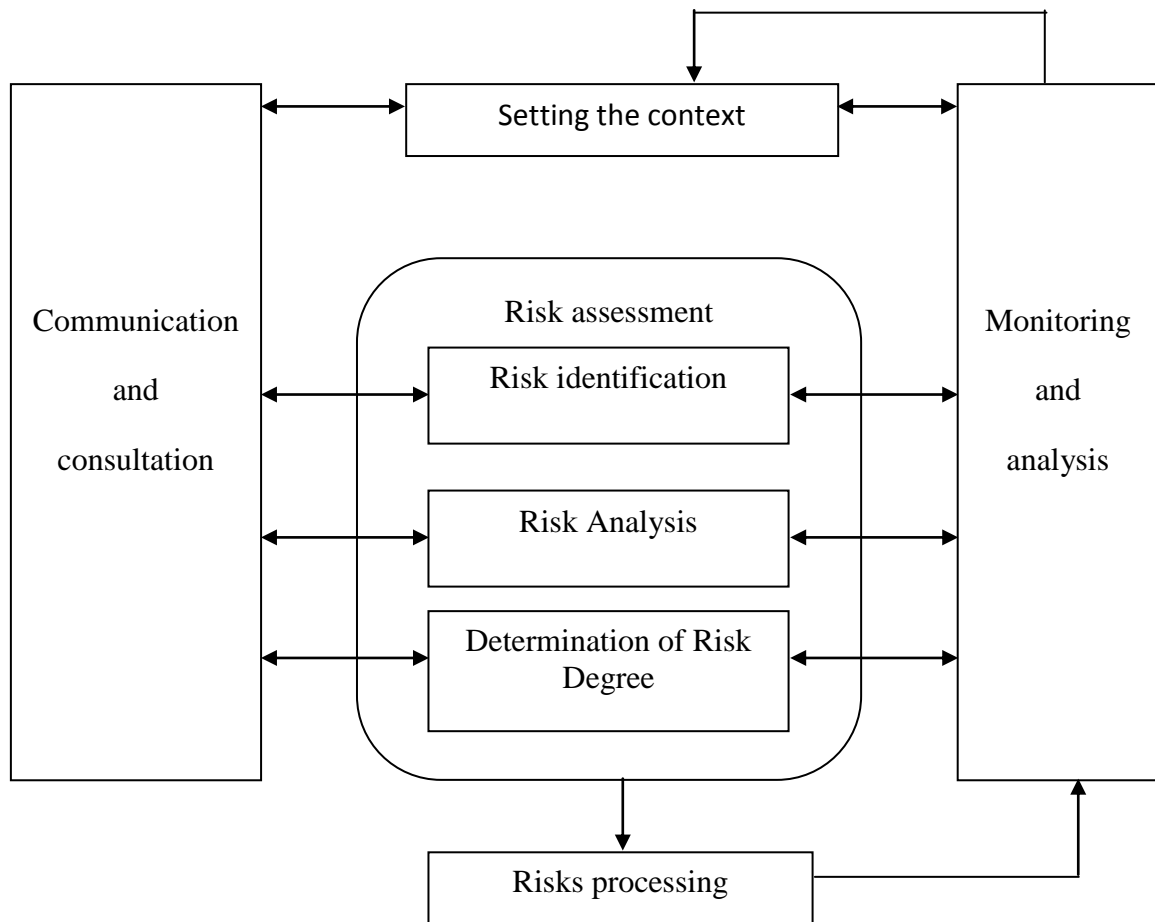

Figure 4. Risk management process at the enterprise according to ISO 31000: 2009 standard

There are some factors that hinder the effective risk assessment when creating a risk assessment system for risk management: it is important to overcome these barriers to properly arranging the risk management process and to properly evaluate the risk. These barriers are given at table 2.

Table 2. Risk barriers [ISO 31000:2009 — Principles and Guidelines on Implementation, 2009.]

1	The absence of planning
2	Limited resources
3	If the planning is designed for a short period of time

4	Lack of high quality actual information
5	Absence of qualified personnel, experience and resources at the enterprise
6	The difficulty of accurately evaluating risks and opportunities and achieving a rational balance between them
7	Fear of innovation failure
8	In some cases, political concerns related to the need for open risk acceptance

Many of these factors operate simultaneously and in unity. These obstacles indicate the need for adequate and timely risk assessment and formulate a database of information that decision makers and their advisors have the information they need and also create an organization's culture and incentive that ensures that the risk is well thought out.

The organization should identify the source of risk, its impact areas, risk situations, causes, as well as their potential outcomes before commencing work. For this purpose, risk identification should be undertaken, which is to compile a complete list of risks that the organization can achieve to achieve the desired outcome. It is also important to identify the risks associated with lost opportunities. Also, full identification is very important, as if at this stage there is an unequal risk, it will not be included in the analysis at a later stage. And thus, there is a potential risk of future risk. Identification should cover all risks, even if the source of the risk is unknown. It does not matter if the source of the risk is under the control of an entity.

Employees with relevant knowledge in risk identification should be involved in the risk identification process.

Understanding it is crucial to the risk analysis. Risk analysis ensures that decisions are made on different types and levels, particularly those related to choice. Risk analysis incorporates the causes and sources of risk, its positive and negative consequences and the likelihood of these consequences. Also, existing management methods, their effectiveness and adequacy should be kept in focus. Factors such as overlapping of experts' opinions, constant reliability and regularity of information, and restrictions in modeling should be clearly formulated and put to the forefront.

The purpose of the risk assessment is joint action when making decisions based on the results of the risk analysis that is important. Determination of the degree of risk involves the comparison of the criteria of the degree of risk found in the risk analysis process with the criteria set out in the context of the context. The importance of processing is reviewed on the basis of such comparisons. Decisions should be made in accordance with legislation of country and relevant regulatory requirements. In some cases, the risk assessment results indicate that additional valuation is essential. Stages of the risk treatment process are shown in Table 3 in sequence.

Table 3. Stages of the risk treatment process in accordance with the requirements of the ISO 31000 standard

1	Evaluation of risk processing
2	Adopting a decision on the availability of existing risk
3	Application of new generation processing techniques, if risk is not acceptable
4	Evaluating the effectiveness of processing

A risk treatment plan is prepared for risk treatment purposes. The objective of risk treatment plans is to document how the selected processing method will be applied.

Risk management is an integral and important part of the overall good governance of the organization. Based on ISO 31000 standard requirements, the following 10 principles are proposed for ensuring effective risk management:

1	The organization should be careful about the risk management process
2	Risk management should be closely interconnected with organizational management

3	Responsibility for risk management should also be closely related to strategic management
4	The integrity of the approaches should be ensured. The risk management should be considered during the selection of the benefits and the distribution of revenue, and the decision making should be integrated both at the employee and the strategic level.
5	Risk management is a catalyst for changes in the organization's culture. Effective risk management has an inevitable effect on the organization, creating a favorable environment for communication, culture, leadership and innovation, which is essential for the economic growth of the organization.
6	Risk management is a non-static, dynamic, continuous process. The risk management process is aimed at achieving the organization's goals. When the goals are changed, the risk management process is also changed.
7	Risk management should be systematic, consistent and proportional to the level of risk.
8	Risk management should be a serious process that meets the expectations of decision-makers and stakeholders based on internal or external context, adapted to the organization's strategic goals or needs of any project.
9	Risk management should be a justified decision. Risk management should ensure that all objective factors of the risk are reviewed.
10	Risk management should be a transparent process.

Method

In this research, the international standards applied to risk management, their application processes, and the benefits obtained from the application of these standards have been studied. Also, were reviewed researches on the implementation of international risk management standards of different researches from various countries. The results of different studies have been compared and conclusions have been made.

Findings

The manufacturer of the ISO 31000 standard gets a guarantees for the quality of the product, regardless of the production volume and the type of product he/ she is accustomed to. And most importantly, the high quality products obtained by the requirements of international standards do not require large amounts of material facilities and resources. And here the number of losses and disadvantages is at a minimum level.

Any manufacturer who applies and maintains the HACCP systems principles is able to evade from 5 from dangerous factors that are shown in table 4.

Table 4. Hazardous factors that Enterprises can be prevented by applying the HACCP system

1	The application of a wide range of potentially hazardous materials	
2	3 types of risk	Chemical
		Biological
		Physical
3	Endangering human health	
4	Waste of financial resources	
5	Losses that may result from improper or incorrect production	

Results, Conclusions and Recommendations

The researchers used the elements of the principles of the HACCP system at the University cafeteria, provided staff with training, and organized microbiological tests to identify the bacterial content of 894 samples. Consequently,

harmful microbiological bacteria and organisms have not been identified in the samples taken from them and the researchers emphasized the importance of the application of this system and the importance of organizing trainings [6]. Another group of researchers from Turkey conducted a research on the quality of the food at the hospital, the views of patients who eat these dishes, and the testing of samples. In the study, 466 patients were evaluated before and after the HACCP system, evaluating 74.7, and later, 81.3.

Establishing and applying a risk management system that meets international standards for risk management protects the production process from the risks of the risks, low product quality and high quality. In this regard, taking into consideration the requirements of world-class standard projects and the application of these standards directly to the production process, which are tested during the risk management process, make the risk management process more efficient.

Thus, given the fact that the risk management process has been applied to many important areas of high risk, which can directly affect the health of people and the environment, we clearly see the importance of this process based on the requirements of international standard technical documents - standard projects.

Paradigms of Modern Education: Perspectives of Life-long Learning Technology Development in Azerbaijan

Sabuhi Miladdin TANRIVERDIYEV¹

¹*Azerbaijan State University of Economics (UNEC), Director of Distance, correspondence and additional professional education center of UNEC*

Email: sabuhi.tanriverdiyev@unec.edu.az

Abstract

Nowadays, there is an increasingly important basic skill in ever-changing technological universe: ability to learn and adapt to the needed new skills and training. The main purpose of lifelong learning is to allow individuals to take active part in all walks of socio-economic life in order to be able to adapt to the information society they live in and better secure their lives. Lifelong education is the provision or use of both formal and informal learning opportunities throughout people's lives in order to foster the continuous development and improvement of the knowledge and skills needed for employment and personal fulfillment. Significant efforts have been carried out in latest years to develop education, particularly in establishing and developing processes for lifelong learning and ongoing education in Azerbaijan. The 4th strategic direction of the State Education Strategy for the Republic of Azerbaijan, provides an educational infrastructure to fully satisfy the demands of the modern world and provide long-term education. With the aim of implementing this Strategy in the scope of its Action Plan, The Cabinet of Ministers of the Republic of Azerbaijan has approved, the "National Qualifications Framework for Life-Long Education in the Republic of Azerbaijan."

Keywords: Lifelong education, Technology, Quality of education, Labor market requirements.

Introduction

The most important factor to consider when building a competitive national economy is the direct proportion of sustainable economic growth with the quality of education in the country. The ever-increasing importance of education in human life today makes the ideology of the transfer of ready knowledge to the ideology of the formation of competences over time. Already in the world, the quality of education is no longer measured by the number of years of study of the person receiving the education, but by the usefulness of what he has learned for the life of him and members of society. In our constantly changing technological world, a basic habit becomes even more important: to be able to adapt to the necessary new habits and be able to learn.

In our time, there are serious changes in the "education paradigm" of post-industrial and information societies in comparison with the "education paradigm" of the industrial society, and according to the philosophy of these changes, being the achievement of individuality, education acts as a means of self-realization in life. In the hundreds of years since the introduction of the Humboldt model of university activity, approaches to the content, purpose and methods of teaching in traditional education are rapidly changing and updating. Education is at the heart of human progress. Economic and social prosperity in the 21st century depend on the ability of nations to educate all members of their societies to be prepared to thrive in a rapidly changing world. An innovative society prepares its people to embrace change.

The growth of the globalized and rapidly changing knowledge economy once again proves that people need to increase their professionalism and professional level in order to be competitive in the work process and to be successful in their personal lives. Thanks to this new thinking, a new progressive principle in public consciousness and public policy has been put forward in developed countries that seek to reach more people in higher education: education is not simply a specialist training, but rather a general intellectual, technological and cultural purpose of society. The international community has developed a number of strategic programs to ensure the appropriate role of education for all age categories of the population. These programs cover two main

areas of innovation in education - 'education for all' and 'lifelong learning'. The main provisions of the UNESCO-initiated strategy "Education for all" (Education for All, EFA) were put forward at the "Education For All-World Conference" held in Jomtien, Thailand in 1990. The World Declaration on Education for All adopted at the conference stressed that "education is the fundamental right of all women and men, regardless of age, all over the world... education should lay the foundation for a safer, healthy, developed and ecologically clean world and at the same time lead to social, economic and cultural progress, tolerance and international cooperation... education is a necessary condition for personal and social improvement". Educational Conference for All and Jomtien declaration highlighted the crucial role of education for the national development of states, as well as for the preparation of young people for active and productive life in 21st century societies. The concept of "Lifelong Learning" adopted by the ministers of education of OECD countries in 1996 has essentially completed the strategy of "education for all" and serves to promote the human being to the modern information-market environment. The concept of lifelong learning is particularly important for developing countries and transitional economies, because in these countries, the environment of both society and individual is changing rapidly.

Table 1. Changing paradigms in traditional and modern teaching (Human Development, 2014).

Elements of paradigms	Industrial Society	The Postindustrial Society
Values	Education is for public production Education is for life readiness	Education is for one's moving forward in life (personal career, dreams) Education continues throughout life
Motives	Education is compulsory for learners The activity of the educator is the fulfillment of the professional duty	Education should increase the interest and enthusiasm of learners The educator is genuinely interested in the development of students
Norms	The educator is responsible for the success of the teaching ("there is no bad student, there is a bad teacher") Teacher's authority is formed by keeping distance and requiring disciplinary and serious effort from students.	Learners are responsible for their own learning ("no teacher can teach you unless you want to learn") The educator's authority comes at the expense of his personal qualities
Goals	Education contributes to the acquisition of scientific knowledge	Education shapes human culture and teaches practical skills
Participants	Educator transmits knowledge The educator is superior to the learners	Educator creates conditions for independent learning Educator is a partner of learners
Methods	Hierarchical and authoritarian methods Stable structure of subjects Group exercises are preferred under the guidance of the educator	Active participation and egalitarian methods Dynamic structure of subjects Emphasis is placed on the independent work of learners
Tools	The main teaching material is textbook	In addition to the textbook, various information, telecommunications, traditional, and social media resources are encouraged to use
Control and evaluation	Supervision and evaluation are mostly performed by educators	Self-control and self-assessment of learners are emphasized

Lifelong education can be viewed as a learning process that equals life expectancy. Lifelong education takes place everywhere at school, at work, at home, and in short, within society. Boundaries such as age, social status or level of education for Lifelong Learning are not subject to discussion. For this reason, it is necessary to perceive lifelong education as a continuous activity that supports the acquisition of knowledge and skills that will ensure the success of both individuals and society both professionally and socially (Strengthening the system of vocational education and training (SVET), 2006). The main purpose of lifelong learning is to allow individuals to take active part in all walks of socio-economic life in order to be able to adapt to the information society they live in and better secure their lives. (Turkey lifelong learning strategy document, 2009). At present, education, along with the knowledge and skills required in the economy, should carry out such tasks as

comprehensive preparation of the citizen for future integration into life and society. The satisfaction of the need for lifelong learning is one of the factors that increase the role of education in economic life". (National Strategy for the development of education in the Republic of Azerbaijan, 2013)

Lifelong learning is based on the idea that children, young people and other people can benefit from the educational opportunities they need throughout their lives. The fact that school education takes place in the individual's childhood and youth period can cause the individual to remain incompetent in solving real life problems that he will face in the period after graduating from school. For this reason, the period of post-school and post-university education is becoming more important in solving the problems of people who have exceeded childhood and youth. The term continuous education and lifelong learning was first used in the materials of UNESCO in 1968, and in 1972 UNESCO adopted a decision on the principle of continuous and lifelong education as the basic principle, "leading structure" for innovations and reforms in the field of education in all countries of the world. (Zaitseva, O., 2009). Lifelong learning is no longer just one aspect of education and training; it must become the guiding principle for provision and participating across the full continuum of learning context. (Abukari, A., 2004). Lifelong learning offers people the opportunity to bring up to date their knowledge of activities which they had either previously laid aside or always wanted to try but were unable; to try out activities and pursuits that they had previously imagined were outside their time or competence; or to work at extending their intellectual horizons by seeking to understand and master some of the recent cognitive advances, that have transformed their worlds. (Aspin, D. & Chapman, J., 2001.)

The main element of the European Union's educational policy is lifelong education. In the texts that shape the education policy of the Union, lifelong learning is not only a form of education and vocational training, but also the concept of guiding individuals to form a learning environment and participate in this learning environment. (Erhan Baghji, 2011). Life-long education policies in the European Union have gained importance with the adoption of the 1996 "European Year of Lifelong Learning" and accelerated by the Lisbon summit in 2000, which set the 10-year strategic goals. (Osman Samanji, Ebru Ojaklı, 2017). According to the Lisbon strategy, lifelong education covers all forms of education and training at all stages of life - from preschool to retirement and beyond, with the aim of providing any purposeful education that is carried out continuously in order to improve the knowledge, skills and competences needed for personal and social development, as well as for employment. The following are some of the key points of Lisbon's strategy for lifelong education:

- High quality preschool education;
- Elementary education that enables all children to read, write, score, and master the skills of information and communication technologies and to develop basic social skills;
- Secondary education to develop the necessary knowledge and skills in all students, taking into account the requirements of the labor market;
- Professional education and training that builds skills and habits that meet the requirements of the labor market and state-of-the-art technology, as well as achieving higher professional qualifications in various fields;
- Higher education, which provides opportunities for every person who will be able to make a profit in the labor market as a specialist with a diploma and provides conditions for benefiting from these opportunities;
- Professional training of citizens and their families, providing real opportunities for life-long professional development, carried out with the appropriate support of employers or the state.

On October 30, 2000, the European Commission declared a "Lifelong Learning Memorandum" and defined lifelong learning as an umbrella that provides a combination of all types and forms of education. The commission recommended the formation of a society in which equal opportunities for all people for lifelong learning are recognized, educational services are determined and regulated according to the requirements of

individuals. The European Union is preparing and developing strategies to continuously upgrade and improve lifelong learning systems so that its citizens can actively participate in the business, adapt to changes in society, and easily access needed education programs.

The goal of the lifelong learning process is not only to teach a person all his life, but also to ensure his own learning. Today, lifelong education is realized through both formal and informal education. Formal education is related to the acquisition of certain qualifications and degrees, in the end, the person receives a diploma of graduation of any secondary or higher education institution, a diploma of a doctor of philosophy or a professional qualification recognized in the labor market. Informal education is an education where the level of formal qualification cannot be obtained, and at the end of this education frame, it is also possible to obtain any document (preschool education of children, additional education, certificate programs, foreign language and refresher courses). Informal education is the process by which each person learns himself at any time in his daily activities, in the process of work, at home, at rest.

The Communication on lifelong learning (European Commission, 2001) defines core concepts as follows: (a) formal learning is typically provided by education or training institutions, structured and leading to certification. Formal learning is intentional from the learner's perspective; (b) non-formal learning is not provided by an education or training institution and typically it does not lead to certification. However, it is structured, in terms of learning objectives, learning time or learning support. Non-formal learning is intentional from the learner's point of view; (c) informal learning results from daily life activities related to work, family or leisure. It is not structured. Typically, it does not lead to certification. Informal learning may be intentional but in most cases, it is non-intentional. (Colardyn, D. & Bjornavold. J., 2005).

Lifelong learning takes place at all times and in all places, as:

- Age 0-5 years: A lot of learning takes place during this age group to provide a foundation for future learning habits and talents. This is probably the age with the highest amount of informal learning as children imitate almost everything from parents, peers and their environment.
- Age 6-24 years: Learning at this age group primarily takes place in educational institutions, from primary and secondary to tertiary levels.
- Age 25-60 years: This age group can learn informally through the use of instructional media, mostly from their occupations, work-places, colleagues, touring, mass media, information technologies, environment and nature. Adults learn from experiences and problem solving.
- Age 60+ years: Elderly people can learn a great deal from activities suitable to their age e.g. art, music, sports for the elderly, handicrafts and social work. (Marjan L., 2011).

Issues related to formal education in Azerbaijan are regulated by the "Rules of Formal Education Organization" approved by the Cabinet of Ministers decision No. 147 dated August 6, 2010. According to the rules, formal education is a form of education, which ends with the issuance of a state educational document. According to the rules, since general education, primary vocational education, secondary vocational education, higher education, retraining, higher or secondary vocational education is completed with the issuance of the state educational document, formal education is carried out through visual, correspondence, distance (distance), free (eksternat) forms defined by the legislation. According to the rules, formal education is carried out in general, primary vocational, secondary, higher and additional educational institutions.

Methods

The beginning of this article provides an overview of the concept of lifelong learning and explores the concepts of lifelong learning. The answer to the main questions on this topic was determined as a result of the analysis of

the literature on lifelong education, as well as the analysis of the legal normative base of the modern education system of Azerbaijan and the real situation of the development of the education system. The main objective of the study was to investigate the following topics:

1. To determine the importance of developing lifelong learning technologies in ensuring sustainable development of the country in the era of knowledge economy;
2. A comprehensive analysis of the main directions of the state policy and the current state of the legal framework in this field, implemented in order to re-establish the concept of lifelong education, which acts as a new paradigm of education in the popularization of education in Azerbaijan and wide application of the concept of continuous education;
3. Investigation of the present state of activity of elements of the education system that ensure the reintegration of the concept of lifelong education in Azerbaijan;
4. Identification of existing problems in the development of lifelong learning system, as well as measures necessary to be implemented by the state in this field.

The data required for this study were obtained from the reports of the Statistical Committee of the Republic of Azerbaijan, the Ministry of Finance, the World Bank and other international organizations. Comparative, historical and statistical analysis, analysis and synthesis, induction and deduction, abstraction were used in the course of the study.

Findings

In recent years, important work has been done to develop education in Azerbaijan, especially to establish and develop lifelong education and continuing education. In Article 11 of the Education Law of the Republic of Azerbaijan adopted on June 19, 2009, as one of the main tasks of the organization of education, it was determined that the students should receive continuous education, acquire knowledge and outlook which are constantly updated, conforming to modern standards, meet the needs of society more effectively, develop as a personality and ensure that lifelong education is open and equal for all.

The development concept of “Azerbaijan 2020: outlook for the future”, approved by the decree of the president of the Republic of Azerbaijan dated December 29, 2012, is intended to modernize library activities to meet the growing demand for self-education and lifelong learning, increase the number of electronic libraries, support the development of distance education and wide application of distance education in higher education. (*DEVELOPMENT CONCEPT “AZERBAIJAN - 2020: OUTLOOK FOR THE FUTURE”*. (2012)

The fourth strategic direction of the “State Strategy for the Development of Education in the Republic of Azerbaijan” adopted in October 2013 is intended to create an educational infrastructure that meets modern requirements and provides lifelong learning, which includes measures such as establishment of infrastructure in accordance with information and communication technologies based training methodology in educational institutions, establishment of regional universal centers providing distance education, education and development for children in need of gifted and special care, education of the elderly, vocational and educational advisory services, modern vocational and educational centers and schools, creation of campuses.

On July 18, 2018, the Cabinet of Ministers of the Republic of Azerbaijan approved the “National Qualifications Framework for lifelong learning of the Republic of Azerbaijan” in order to ensure the implementation of the action plan on the implementation of this strategy. As one of the main objectives of the National Qualifications Framework for lifelong education of the Republic of Azerbaijan, support for lifelong learning, recognition of skills acquired through non-formal and non-formal education has been determined, as well as levels of National Qualifications Framework and level descriptors, documents confirming them have been determined.

Provision of vocational training and qualification for elderly persons has been determined as one of the strategic targets and priorities of the “Strategic Road Map on the Development of Vocational Education and Training in the Republic of Azerbaijan” prepared in 2016 in order to develop the vocational education system that prepares qualified personnel based on educational programs in accordance with the requirements of the labor market in Azerbaijan. The strategic road map shows that the education of elderly people is an integral part of the lifelong education system, and it is an educational process that enables the population to adapt and flexibly adapt to dynamic changes in society and economy. According to the strategic roadmap, older persons are the ones who have passed the age of maturity, have lived an independent life, have life experience and, in many cases, a profession.

In order to ensure the opportunity of each citizen to receive continuous education, the Cabinet of Ministers of the Republic of Azerbaijan approved “The procedure for the content, organization of supplementary education, and the provision of relevant documentation to those who received additional education” with the decision No 163 of September 6, 2010. This rule is the main normative framework for the implementation of lifelong education in Azerbaijan. It is indicated in the procedure that additional education provides an opportunity for each citizen to receive continuous education and carries out the tasks of development of human potential, enhancement and improvement of the level of human resources and vocational training, their adaptation to constantly changing and renewing working conditions, ensuring active and effective participation of elderly citizens in the social, economic, political and cultural life of the country. According to the procedure, for the purpose of lifelong education in the Republic of Azerbaijan, it is possible to benefit from such directions as further education, retraining of personnel, stacking and improvement of personnel, re-higher education and secondary specialized education, raising degrees and elderly education, and persons who have received education in one of these directions are given the relevant document on the basis of mastering educational programs. According to the rules, the main purpose of the qualification education is to raise and improve the level of intellectual and vocational training in the specialty of each specialist, to adapt to constantly updated working conditions, to ensure active and effective participation in the social, economic, political and cultural life of the country. Training and professional development aims to improve the professionalism of the staff, to improve the skills of the personnel, to link theoretical knowledge with the experience, to gain more modern professional knowledge and skills, to gain experience in the application of new technologies and innovation systems. Raising the rates reflected in the rules is the type of education that provides for the preparation of personnel who have graduated from secondary vocational education institutions and received a sub-bachelor's degree in the appropriate specialties. The direction of education of the elderly is due to the need to re-specialize, adapt to new conditions and create new job opportunities for a large part of the able-bodied population to be competitive in the labor market. The purpose of the education of the elderly is to ensure the active participation of the elderly citizens in the ever-changing life of society.

Table 2. Key indicators of education during independence years in Azerbaijan

	1990	1995	2000	2005	2010	2015	2016	2017
Number of pre-school education institutions	2185	1973	1790	1764	1638	1722	1750	1 785

Number of institutions implementing doctoral programs	...	15	21	21	26	78	77	88
Number of students enrolled in doctoral program – persons	...	38	47	80	91	593	541	555

In 2017, there were significant reductions in all indicators of preschool education in Azerbaijan compared to 1995. Thus, a decrease was observed both in the number of preschool institutions (a decrease of 18 percent) and in the number of children in preschool institutions (a decrease of 31 percent). Taking into account the increase in the number of population in Azerbaijan by 1-1.5 per cent annually, we can say that this is an indicator of the fact that these people do not direct their children to preschool institutions. In contrast to pre-school education, there is an increase in all indicators in general education schools. The number of general education institutions increased by 4 per cent, the number of children studying in these institutions by 12.6 per cent, and the number of teachers teaching in these institutions by 26 per cent. The low growth observed in the number of general educational institutions should not mean that the material and technical base is not enriched. Over the past period, very serious work has been carried out to update the educational infrastructure. Over 3200 new school buildings in Azerbaijan have been renovated in the last 15 years. This indicator is more than 70 per cent of the total number of schools in the country. The most serious decline in the education system is observed in the field of vocational education. The number of vocational education institutions decreased from 176 in 1995 to 111 in 2017, and the number of students studying more than 3 times. The reason was a decrease in the interest in this field of education in Azerbaijan, which was in transition period. Although there is also a decrease in the number of secondary vocational education on all indicators, there was an increase observed in the number of higher

education institutions in the comparable period, by 3 times in 1995-2017, the number of students studying at higher education institutions by 60%, the number of students per 10,000 people by 17%, the number of students admitted to undergraduate studies by two times. The number of specialists graduated from higher education institutions also increased by 2 times. Increasing interest in the field of science in the country can be seen in the increased interest in doctoral and PhD programs. Significant increases for the comparable periods in both directions were recorded (Table 2). In 2018-2019 academic year, by organizing school preparation groups at the expense of the state budget in general education institutions, the level of involvement of 5-year-olds in education reached 75 per cent from 24 per cent in 2013. According to the Ministry of Education of the Republic of Azerbaijan, in the coming years this indicator will reach 90 per cent and cover all 5-year-olds in the future are the main targets.

Table 3. The share of education costs in the gross domestic product and the state budget of Azerbaijan (in manats).

	2012	2013	2014	2015	2016	2017	2018	2019
Gross domestic product	54743,7	58182,0	59014,1	54380,0	60425,2	70337,8	79797,3	
Expenses of the state budget	17072,0	19850,0	20063,0	16264,0	18495,0	17941,0	22731,6	25190,0
Government expenditure on education, total	1453,2	1437,7	1553,9	1605,1	1754,4	1742,7	2044,0	2274,6
Share of education costs in gross domestic product	2,7	2,5	2,6	3,0	2,9	2,5	2,6	
Share of education expenditures in the state budget	8,5	7,2	7,7	9,9	9,5	9,7	9,0	9,0

Source: The table is based on the data of the Ministry of Finance of the Republic of Azerbaijan and the State Statistical Committee of the Republic of Azerbaijan.

Based on statistical analysis, it can be said that there is a rapid growth of state care for the development of the education sector in Azerbaijan. Thus, the proportion of expenditures on education in the state budget increased by about 50% in 2018 compared to 2012 and by about 60% in 2019 (Table 3). There has also been an increase in the share of education expenditure in GDP, and in 2012-2014, the share of education expenditures in GDP increased from 7.2-8.5% to 9.0% in 2019. However, despite all this, the total public expenditure on education sector in Azerbaijan and the share in the gross domestic product is less than in other CIS countries and world countries (Table 4)

Table 4. Government expenditure on education, total

Countries	% of government expenditure	% of GDP
World (2015)	14,0%	4,8%
Azerbaijan (2016)	8,2%	2,9%
Japan (2016)	9,1%	3,5%
United Kingdom (2016)	13,9%	5,5%
Ukraine (2016)	12,4%	5,0%
Chile (2016)	21,2%	5,4%
Malaysia (2017)	21,1%	4,7%
Georgia (2017)	13,0%	3,8%

Results, Conclusions and Recommendations

Taking into account the work carried out by the state above, it is possible to say that certain work has been done to formalize the legislation in the field of lifelong education in Azerbaijan, and the work within the framework of the state policy on adaptation of the work to be done and the normative base to be prepared to the advanced international experience in the field of lifelong education is continuing.

It is possible to draw conclusions from all this that the topic of lifelong education in Azerbaijan begins to be more active over time despite the fact that the concept of lifelong education has appeared relatively recently, its importance and necessity as one of the important elements of the national education model is fully manifested. Poor education and awareness in the lifelong education community in Azerbaijan is currently associated with a lack of interest in life-long education and lifelong learning activities, as well as poor participation in the process. The interest in lifelong learning will not be strong unless the public can be provided with extensive information on the work done in the field of lifelong learning, the activities and technologies in this direction, in other words, the existing opportunities. For this reason, it is important to inform and educate the whole society about the benefits of lifelong learning. The following should formulate the main directions of activities, strategic plans and programs to be implemented by the state in the direction of lifelong education in Azerbaijan:

- formation of a lifelong learning and learning culture in society
- increase lifetime education opportunities and reach these opportunities, improve lifelong learning, monitoring and evaluation system;
- formalization of the state policy on the solution of such issues as the need for a manpower with the technical skills required by the labor market.

Abstract

Education is one of the most important development criteria of countries. In the evaluation of development, it is not wrong to say that the place of education comes first, besides social, economic and political parameters. There are many reasons for this. Development and social development cannot be unilateral, that is to say, only economically. Today we can understand more. It is observed that all development parameters pass through the education chain and the related quality evaluations, considering the current conditions more clearly. Considering the development principles and expenditures on education, or rather the investments of all the countries of the world, it will be better understood what the development values of highly developed, intermediate developed and underdeveloped countries are. Because education expenditures mean more investments for the future for countries and countries can transfer their investments to other living sectors through education.

Key words: Education, Social development, Economy.

Introduction

Since social development is based on individual development, that is, the individual possesses the necessary equipment to keep up with the rising values in his age, the most important preliminary stage of social development depends on the position of the individual, on the level of education. It is not in vain for development economics to be among these new rising values. Education is the most important factor affecting development due to its development. Therefore, it can be said that there is a positive relationship between education and development. At this stage, it should not be forgotten that education of individuals should have a systematic that educates healthy individuals. It cannot be denied that healthy education can only produce healthy societies. This should be considered as a precondition for advanced contemporary society.

The concept of development constitutes a network that includes qualitative data as well as numerical data. The scale of the increase in the national income of the country presents data as a parallel indicator of the increase in welfare. Social development, economic development, or growth has a close meaning and the concept of growth, not only the increase in the national income in a country, while taking into account the development of social, political and cultural situations (Berber, 2006). Countries with slow pace of development are identified as underdeveloped countries. In this context, many economists evaluate why these countries have not developed yet. Underdeveloped countries have many similar features in political, social, economic and cultural terms. In general, per capita income of economically underdeveloped countries is lower than that of developed countries. Inadequate infrastructure, malnutrition, low quality education, high birth rates, inadequate health conditions, rapid population growth, traditional community structure, high unemployment rates, lack of confidence in political authority, and so on. Today, only economic factors are not taken into consideration in the evaluation of many developed or developing countries in terms of development. It is also evaluated in political, social and human factors. In this respect, the phenomenon of education has recently reached an important point in terms of economic development.

Education is not only perceived as a literacy phenomenon. The aim of the education in the economy is to raise people with high human capital. In this context, the importance given to education is increasing day by day. Countries now consider spending on education and labor as future long-term investments. In other words, they emphasize not only a monetary capital but also the importance of human capital. In an economy, not only monetary concepts machinery and equipment but also human factor have started to play an important role in

increasing productivity. This human factor is also seen as a high human capital, equipped with the ability to produce new products and technologies in the country.

In other words, they emphasize not only a monetary capital but also the importance of human capital. In an economy, not only monetary concepts machinery and equipment but also human factor have started to play an important role in increasing productivity. This human factor is also seen as a high human capital, equipped with the ability to produce new products and technologies in the country.

Therefore, education not only increases the knowledge level of people, but also contributes to the economic development of countries and their survival from competition with world countries. In general, there is a close connection between development and education. At the same time, while examining the development of countries, these phenomena and situations based on education are evaluated.

In addition to being a positive link between economic development, social development and education, education also has positive relations with political and cultural factors. Countries, especially developed countries, attach great importance to education. The importance given to education is not only manifested by individuals, but also by the importance given to the development of productive and innovative minds. In this way, it contributes greatly to the development of the products produced in the country, the production of new products and technologies as well as the development of the countries both economically and socially and politically.

Methodology of Research

In this study, qualitative data are examined and articulated with quantitative data. The data were analyzed and their equivalents in practice were evaluated and compared with qualitative data. Domestic and foreign written products were examined; The problematic topics that are concentrated around the subject are explained with numerical and indicative values. Comparison and analysis approaches were used.

Findings

Since the research subject with problematic and widespread impact is of great importance for our country, qualitative data has been explained with numerical values and new provision area has been created for the future. In this way, suggestions are made for the development of the country and the increase of the quality of manpower, and it is aimed to add human capital in parallel with the developing values. The biography of human capital, which is the multiplier of value in the development of the country, will reach the highest level with education has been revealed.

Development Concept and Domain

Development in a broader sense can be defined as any desired change and development in economic, social and political sphere in a society. Historically, development involves the reduction of human suffering and the mobilization of the potential to increase material well-being in countries that are less developed (Tok, 2010: 2). Historically, the concept of development is defined as an effort to reduce human suffering in less developed countries and to mobilize its potential to increase material welfare. There is a close relationship between the position of economic relations in social life and the usage of the concept of development in the historical process. In the periods when economic relations were considered as a part of social life, the concept of development was used in a wider context than the economic one; the content of this concept is limited to the economy. However, the fact that the development phenomenon is intertwined with non-economic areas and the backwardness that can be explained by the concept is dependent on a number of reasons other than economic factors; the concept can be explained not only economically but also in different fields. However, in this case, there are problems in its differences with close concepts. The concept of development in the real sense refers to

the concept of growth with the concept of structural change; The concept of industrialization is closer to the concept of modernization (Yavilioglu, 2002: 74).

Development is essentially a challenge. It becomes a voluntary intervention in economic and social life and eventually a race of wealth. This intervention is directed towards distribution relations as well as nature. Economic development with a human dimension is defined as the increase of living standards, in other words, the welfare level, that is, bringing the distribution of income to a more equitable form and taking more people from the growing cake. Even though the increase in the quantity of production and the development of its quality are of great importance, the fair distribution of the wealth resulting from this situation among the income groups living in that society is also of great importance (Source, 2011: 83).

The Lorenz curve is a geometric method used to measure inequality in income distribution. The Lorenz curve shows how much of the income goes to the population. The inequality in income distribution grows as the Lorenz curve moves away from absolute equality line. The ratio here is in the range of 0-1. When this coefficient approaches to 1, it shows that income injustice increases, and when it approaches 0, it shows that inequality in income distribution decreases. Gini coefficient is also used in creating the Lorenz curve (Top, 2006: 110-138).

Table 1. Gini Coefficients in Selected Countries

<u>Kyrgyzstan</u>	<u>Ethiopia</u>	<u>India</u>	<u>Egypt</u>	<u>China</u>	<u>Russia</u>	<u>Mexico</u>	<u>Turkey</u>	<u>Norway</u>	<u>England</u>
<u>2009</u>	<u>2005</u>	<u>2005</u>	<u>2008</u>	<u>2005</u>	<u>2009</u>	<u>2010</u>	<u>2008</u>	<u>2013</u>	<u>2012</u>
<u>0,36</u>	<u>0,30</u>	<u>0,33</u>	<u>0,31</u>	<u>0,43</u>	<u>0,40</u>	<u>0,48</u>	<u>0,39</u>	<u>0,23</u>	<u>0,33</u>

Source: Worldbank, 2014.

When the table above is analyzed, it shows the injustice of the countries' income distribution according to Gini coefficients. The extent of injustice in income distribution provides information on the level of development of that country. Injustice in income distribution decreases as middle-income countries go to high-income countries (Berber, 2006: 248). This can be explained by the Kuznets Inverse U Curve, which shows the relationship between Gini coefficient and per capita income. In his study published in 1963, S. Kuznets showed that the Gini coefficient increased to a certain point (threshold income level) as the per capita income level increased, and the gini coefficient decreased as the per capita income continued to increase (Source, 2011: 19). The table above confirms Kuznets' theory. Kyrgyzstan and income distribution in developed countries like Ethiopia and in underdeveloped countries such as Norway and the UK, is more justification than developing countries such as Mexico and Turkey.

Education

In general, development is an economic and social process. In this sense, the contribution of education to the high levels of development criteria of countries is quite large. Raising a large number of young people in line with the goal of a developing economy and constitution indicates that education has economic, as well as social, cultural and psychological impacts. These effects reflected in the economic situation in the country causes countries to be classified as underdeveloped or developed (Çakmak, 2008: 36).

As a result of these explanations, underdevelopment is accepted as the inadequacy of some basic skills rather than income poverty in a country. Literacy rate in a country, enrollment rate, teacher per student, spending shares allocated to education, etc. many cases are evaluated. However, the rates in the country are determined and the country is determined to be underdeveloped or developed. Today, it is clearly seen that education has the biggest share in the success of developing countries. Although the above mentioned criteria are the determinants of a country's development, it is not sufficient to have high numerical data alone. These rates are quite low in many less developed countries. However, human capital ownership in these countries is not sufficient. In developed

countries, these rates are high as well as the importance given to research and development. This means qualified labor force, that is, a country with high human capital (Baş, 1994: 136138).

The concept called human capital is defined as the sum of qualified labor, that is, the knowledge and skills possessed. In countries with intensive human capital, other production factors are used more efficiently and new technologies are developed. In this case, the human capital that underdeveloped countries generally have is not sufficient. This causes the backwardness of the countries (Atik, 2006: 6).

A production requires human capital as well as traditional production factors. Therefore, underdeveloped and developing countries that do not have sufficient human capital cannot produce certain goods even if they have sufficient unskilled labor and physical capital. However, developed countries, whose human capital is relatively stronger, can easily produce these goods that require advanced technology. For this reason, just like physical capital investments, an economy needs human capital investment (Özyakışır, 2011: 54).

Table 2. Turkey was evaluated with the enrollment rate at primary level but also in terms of income groups selected from senior country. Table 2 senior selected from the income group of countries at primary level and between the years 2000-2012 in Turkey shows a comparison of enrollment rates.

Jears	Italy	Japan	Poland	Portugal	France	Netherlands	Spain	New Zealand	Russia	Aver.	Turkey

Source: Worldbank, TurkStat, (2014).

The return on investment in education has been made in terms of additional income provided by individuals as a result of education investment, and all of these calculations have shown that education investments are at least as efficient as physical capital investments. Since the differences in earnings after this training show the contribution of educated people to the national income as less than they are-they will also increase the efficiency of the less educated-in fact, the efficiency of educational investments is considerably higher than the average return of physical investments. As a result, the return on education investments may be higher than in developed countries where the loss of time of the people undergoing the education process is less valued than developed countries and the income differences of the skilled and educated people are higher than those of developed countries (Singer, 1971: 58). J. Coleman (2005) says that education is one of the criteria to be used to understand the level and degree of economic development of a country. In addition to economic indicators, the democratic structures of countries and their sustainability in a healthy way are among the development criteria (Tranc. Ergün, 2011: 8).

Economic development is possible with the development of technology that will increase production and the best and rational use of resources and capital. This is provided by educated and high human capital manpower. The

literacy rate of underdevelopment has also started to increase in the underdeveloped countries, but this does not contribute much to the economic situation of the country. The aim is to have a level of education that can read, evaluate and investigate. This situation emerges as the factors separating the less developed and developed countries. For example, many countries with oil, which is a very valuable natural resource, cannot benefit from these resources sufficiently because they do not have human capital power. On the other hand, Germany and Japan, whose natural resources are very limited, can make great economic progress by making the best use of their scarce resources thanks to human manpower (Çakmak, 2008: 37).

According to Öztürk (2005), education increases the development levels of the countries and also helps them to overcome the deficiencies that are shown as common characteristics of many less developed countries.

Accordingly, education;

- Increasing income level
- Ensuring fair share of income
- Increasing the productivity of labor
- Reduction in crime rates
- Ensuring political stability and social solidarity
- Democratization
- Ensuring low fertility and infant mortality rate
- Ensuring technology creation and ease of use

It has functions.

When we look at the above elements, the educational factor contributes to the deficiencies found in most underdeveloped countries. In this case, if the underdeveloped countries have not only the literacy rate but also qualified human capital with a quality education, it is inevitable that they will rise to the level of developed countries.

Education, Adult Model and Its Impact on Development

The main element of education and the main subject is human. The aim of the education and training system should be to train individuals who have reason, heart and pleasure. Turkey is now making splash in the education field, rearing up to a quality over quantity and it is time to perform the moves. The scientific and cultural accumulation that human beings have so far, dating back thousands of years, can sometimes be insufficient to explain what has happened. The scenarios of many experts who thought that the pointer was moving towards mechanization in human and technology interaction; it is seen as an ordinary, lively and up-to-date transmission of what is happening today. The advancement of high value-added technologies at the speed of light has forced all sectors to take serious steps towards transformation. This new period of singularity, expressed as the fourth biggest break in industrialization; biological, digital and physical in one body. Ongoing studies on artificial intelligence reinforce the claim that machines are coming to the stage of breaking the monopoly of human beings on learning and intelligence through what they learn from man (see Education Vision 2023).

The main objective of the 2023 Education Vision is; is to train qualified and moral individuals who are equipped with the skills of the age and the future and who can use this equipment for the sake of humanity, amorous to science, curious and sensitive to culture. We want to educate people who need the education profile and Turkey without putting forward the spirit of determination paradigm, direction, and strength of purpose that we create a universal pedagogy and philosophy. In this respect, human is the focal point of the 2023 Education Vision. Human-centered education approach brings along the values education as human skills and infrastructure. We can show the skillful activities of human resources as the most important whipping factor of production activities. However, this will lead to consulting services and environmental conditions. What will enable this is to channel the pedagogical infrastructure that will contribute to development into practical life supported by

formation. As it is seen that talented individuals are distilled from the generation of values as human centered and added to the service of the country as an added value, it requires an intensive guidance and exploration effort. The heavy burden of responsibility for our teachers plays a major role in this.

The table below reveals that developed countries are also countries that allocate more resources to education and health.

Table 3: Education and Health Indicators of Various Countries

COUNTRIES	Share of Public Education in Total Expenditure (%)	Public expenditure per student/ per capita (%)	Compulsory Education Period (Year)	Health Expenditures / GDP (%)	Average Life.
USA	14,76	23,89	12	15,3	78
CANADA	12,46	-	11	10,0	81
FRANCE	10,59	24,74	11	11,1	81
SWISS	16,33	29,49	9	11,3	82
INDIA	10,74	14,04	9	4,9	63
AFGHANISTAN	-	-	9	5,4	42
MEXICO	25,61	15,47	10	-	-
IRAN	19,98	17,80	8	-	-
ARJANTİN	13,97	15,81	10	10,1	75
JAPAN	9,50	22,31	10	-	-
TURKEY	-	14,35	12	5,6	75

Source: Cumhuriyet; Investigation of the Relationship between Education and Development, International Journal of Social Sciences Education, 2017: 3 (1): 14-32.

As seen from the table, falling public expenditure per student / per capita GDP percentage terms, Turkey ranks lower than any country outside India. The situation is similar in terms of health expenditures. As a result, the average life is lower than the average life in developed countries. The education indicators have emerged as a result of the resources allocated to the education sector and policies in Turkey are shown in the following table. development between European countries and Turkey, the country's education and training when considering factors such as human capital and the contribution to the biography of the indirect contribution of other sectors that education serves an important idea. It also shows that the leading writers of the literary world prioritize education through literary works, and write about the effects of this on the development and development parameters of the country. education is an important fact that needs to be addressed in all human-oriented living spaces. The future of the countries will build on this phenomenon. The most important force in the transformation of the digital age into income sources as human capital and becoming the means of superiority among the competition elements between countries is the technical development and the related innovation activities.

F. Kafka, B. Bichsel, F. Wedekind, H. Hesse and many other writers and thinkers, who are the leading names in Western literature, focused on the theme of education and education as the main thought in their works. It is seen that the importance given to human beings in the development of these people is inevitable and the fact that the force that will provide this is education. It is also worth mentioning J. J. Rousseau's Emile. Sickle related to child education considers all processes in terms of society, institution and development. Emphasizes that the way of social development and becoming the dominant force for the future is through education and especially the orientation-oriented education processes that should start in childhood. Rousseau is one of the most important philosophers who left its mark on the 18th century and guided society with his works and thoughts. Under the influence of the French revolution, philosophers and thinkers living in this century became architects of a period

called “Age of Enlightenment” both in France and around the world. Rousseau is a libertarian and egalitarian thinker and writer who influences, directs and enlightens society in this age with his thoughts and works. He has inspired many philosophers and thinkers with his views in both political theory and educational philosophy.

It is possible to see this close positive interaction and relationship between education and social development in Brief an Vater (Letter to my Father) which is one of the exemplary writings of the world-famous German writer and thinker Kafka (Kafka, 1994: 155). His efforts to become an individual through education and the processes of self-realization can be seen as added value to the future and development of the country. In this article, the relationship between education and children is witnessed as the most important multiplier of building codes of development. Expression attitude in the study is critical. After the culture of criticism, control and fear-oriented culture can only be overcome. The constructive effect of the culture of criticism is a prerequisite in terms of social development parameters in order to establish a culture of development-oriented values (see Cüceloğlu, 2018: 54). The establishment of the culture of democracy depends on this. The development of a culture of values instead of a control-oriented fear culture will be the driving factor of the social development in question. In this way, the pride and self-confidence of the student / child whose personality is not damaged will be complete and affect the social development as added value as a productive individual. The way to do this is through the restructuring of contemporary models that will be articulated in education in accordance with our social spirit biography. Özbek emphasizes the abandonment of obsolete models, which have difficulty in responding to contemporary problems in the context of the subject, and that the way of questioning, studying, criticizing and actively participating in decisions, taking responsibility, and taking responsibility as the basic elements of the culture of democracy depends on educational institutions. (Uzbek, 2004: 106). Time is old, refutes at the same time creates new fertility. Fulfills the judgment of time. Resisting the community, weak resources are exhausted is sentenced to extinction. One should be aware that critical reason is the most effective way to a healthy society.

Results

Education is the most important factor affecting development due to its development. Therefore, it can be said that there is a positive relationship between education and development. Today, only economic factors are not taken into consideration in the evaluation of many developed or developing countries in terms of development. It is also evaluated in political, social and human factors. In this respect, the phenomenon of education has recently reached an important point in terms of economic development. Education is not only perceived as a literacy phenomenon. The aim of the education in the economy is to raise people with high human capital. In this context, the importance given to education is increasing day by day. Countries now consider spending on education and labor as future long-term investments. development between European countries and Turkey, when considering factors such as education and the country's contribution to the human capital, education and other sectors of the indirect contribution to education is important to give an idea about the subject biography.

- The development of a culture of values instead of a control-oriented fear culture will be the driving factor of the social development in question.
- In this way, the pride and self-confidence of the student / child, whose personality is not damaged, will be complete and affect the social development as a productive individual as an added value.
- It should be kept in mind that the basic elements of the culture of democracy, questioning, scrutiny, criticism and active participation in decisions and the way to take responsibility depend on educational institutions.
- It should be the main hope of education systems where the power of the teacher is a creative factor that should never be forgotten.
- It is essential to ensure the growth of the human model, which takes place beyond the 4.0 industrial revolution, not producing and producing new visions in production.

Abstract

The aim of this study was to investigate the correlation between morphological characteristics and lower limb explosive strength. The sample consisted of 100 male respondents aged 4 to 18 years. Variables was composed of 12 anthropometric characteristics, percentage of body fat and vertical jump. For establishment the relationship between morphological features and lower limb explosive power Pearson's correlation coefficient was calculated. The result indicated that there is a statistically significant positive correlation between the morphological characteristics that are predisposed by regular growth and development (body height, arm length, leg length, etc.) and the explosive strength. Also, it shown statistically significant negative correlation between the variables that are indicators of wellbeing (fat percentage, skin folds) and motor performance. It can be concluded that boys who are overweight and obese reported poorer results in motor skill. Therefore, it is very important for children to be physically active to maintain normal health status.

Keywords: Anthropometric characteristics, Children, Motor abilities, Physical activities

Introduction

Morphological features (i.e. somatotype and body configuration) have an essential part in the performance of numerous physical actions (Saha, 2015). Somatotyping has a quite long practice in human biology. In the meantime of the early growth of Sheldon's somatotyping system, investigators have researched the association of somatotype and body composition to physical performance (Raudsepp and Jurimae, 1996). A youth finishes dissimilar stages of motor actions which be influenced by mechanic demands and morphological features (Bjelica, Gojković, Pržulj, Cicović and Joksimović, 2018).

The quantification of muscular ability seems to be of main significance in the identification of the prospective for motor enactment. Between experts, the agreement is that muscular power (or "explosive strength" as frequently converted into practice) is greatest significant for success in numerous everyday lifespan jobs as well as in physical activities. But muscular power is determined by a several of aspects, amongst them neuro motor (e.g., variations in coordination), biomechanical (e.g., muscle contraction physiognomies) plus somatotype and body configuration (Liebermann and Katz, 2003).

Vertical jump is frequently used as an manifestation for the power of the lower limb or explosive leg power (Chu, 1996; Moir, Button, Glaister and Stone, 2004; Richards, 1968; Shellock and Prentice, 1985). Vertical jumping skill is an significant essential ability for many physical actions. Vertical jump height is a dimension that trainers, health care experts, and strength and conditioning specialists regularly practice as an objective functional dimension (Waggener, Barfield and Sessoms, 2002). Papers concentrated on vertical jump concerning

performances propose distinct tests of characteristics for different age groups, followed by morphological features which may essentially affect the performances (Haguenauer, Legreneurm and Monteil, 2005), as well as gender and genetic indicators (Okely and Booth, 2004). Accordingly, countermovement jump without arm swing is commonly used test for define an explosive strength, also lower limb explosive strength is a very important fragment of basic motor abilities that indicates and is in relation with health and quality of life of children. Lepas, Papp, Ihasz, Nagyvaradi and Zrnzevic (2019) in their study concluded that boys who accomplished superior outcomes on measurements of motor abilities are additional physically active, filled of energy, feel well, spend extra period with associates and adore the care of their earls.

So, the objective of this study was to investigate the correlation between morphological features and lower limb explosive strength between boys from early age till adolescent age. From the objective of the study the null hypothesis are appointed. The first hypothesis is that there is a statistically significant positive correlation between anthropometric characteristics that reflect the proper growth and development in accordance with the age and vertical jump in all age groups of respondents. Another hypothesis is that there is a statistically significant negative correlation between the variables which are indicators of obesity (skin folds and body fat percentage) and the vertical jump.

Method

According to the purpose of this study, the investigation was provided on population of boys from early age in kindergartens to adolescents in high schools. Therefore, the sample consisted of 100 male respondents aged 4 to 18 years. The research was conducted in kindergartens and schools from city of Zagreb. All children included in investigation were healthy and parental permissions were collected. The measurements were carrying out in morning hours always by the same educate experts from Faculty of Kinesiology. Variables included in this study was composed of 12 anthropometric characteristics (BH-body height, AL-arm length, LL-leg length, ED-elbow diameter, AD-ankle diameter, SW-shoulder width, BW-body weight, UC-upper arm circumference, LC-lower leg circumference, BS- back skin-fold, US- upper arm skin-fold, SS- suprapatellar skin-fold), percentage of body fat (BF%) and vertical jump without arm swing on platform (CJ-Countermovement Jump). All collected data was analyzed by program Statistica 13.0. For all variables descriptive parameters were calculated (arithmetic mean, minimal results, maximal results, standard deviation). On behalf of normality of distribution Kolmogorov-Smirnov test was provided. In place of founding the connection between morphological features and lower limb explosive strength Pearson's correlation coefficient was calculated.

Findings

In attendance to investigate the relationship between morphological characteristics and motor abilities, precisely lower limb explosive strength, in boys and adolescents the measurements in kindergartens and schools were provided and the following results were collected. The obtained outcomes were analyzed and showed in Tables 1. to 5. Descriptive parameters show the highest range of results in variable *body height*, and the lowest standard deviation in variable *suprapatellar skinfold* (Table 1.). The minimum jump was 12,07cm, and the maximum countermovement jump was 50,77cm. In this table it is not detailed, but from results of descriptive parameters for specific age it is clear that with age the skinfolds of respondent's drastic extent.

Table 1. Descriptive parameters of morphological features and vertical jump

Table 2. shows correlations of morphological features and vertical jump of all respondents (second column) . Simultaneous shows separately correlations of all measured variables in boys from kindergarten aged 4 to 6 years. From marked correlations for all subjects it can be seen that all anthropometric characteristics, except skinfolds and body fat %, are significantly positive connected with vertical jump. That can be discussed that accordingly with age and regular development the boys can expressed their motor ability as it is expected, the motor ability improves. Moreover in young boys aged 4 and 5 there is no statistical significantly connections because in that age the movement coordination and motor knowledge of vertical jump is not clear jet. In age of 6 the connections are marked and in that period boys who have more body fat % and back and upper arm skinfold performed purer result in vertical jump.

Table 2. Correlations of morphological features and vertical jump of all respondents and separately boys from kindergarten

Variables	CJ-all	CJ-age4	CJ-age5	CJ-age6

*-statistically significant correlations on $p \leq 0,05$

Furthermore, the similar results are presented for boys in the age of seven (Table 3.) It can be seen that there is positive correlations of all anthropometric characteristics with vertical jump. That is expected because it is normal that subject who is taller and have longer arms and legs, and stronger body jumps higher. But simultaneously, boys who have higher value of back skinfold, upper-arm skinfold, suprapatellar skinfold and body fat % have negative associations with vertical jump. That means that subject who are overweight presents weaker outcomes in basic motor abilities, precisely explosive strength.

Table 3. Correlations of morphological features and vertical jump of boys younger school age

Variables	CJ-age7	CJ-age8	CJ-age9	CJ-age10
BH	0,61	-0,28	-0,21	0,26
AL	0,90*	-0,60	0,08	0,25
LL	0,43	-0,44	-0,38	0,36

*statistically significant correlations on $p \leq 0,05$

Consequently, with age of respondents the statistically significant connections between morphological features and vertical jump are more expressed. From results of correlation analysis showed in Table 4. and Table 5. it can be seen that for boys from 11 to 14 years of age, who are in pubertal stage, is very important their physical condition to express great result in explosive strength of lower limbs. The same report goes for adolescents (Table 5.). In that period of life, there is no matter if the subject is higher and their body and bones are developed by age, it is more important that they have regular body mass. For the same reason, boys and adolescents who are obese and overweight accomplished poorer results in their motor abilities which indicate bad physical condition and cautions of a high risk of cardiovascular disease and diabetes in later age.

statistically significant correlations on $p \leq 0,05$

*_

According to the findings of this research the hypothesis can be confirmed. There is a statistically significant positive correlation between anthropometric characteristics that reflect the proper growth and development in accordance with the age and vertical jump in all age groups of respondents, also there is a statistically significant negative correlation between the variables which are indicators of obesity (skin folds and body fat percentage) and the vertical jump.

Results, Conclusions and Recommendations

The results in this study indicated that accordingly with age and regular growth and development the boys can express their motor ability as it is expected, the motor ability improves. From this statement it can be concluded that respondents who are mature can jump higher i.e. they have a better developed explosive power because they are older, taller, and stronger which is normal. But also in the direction of results of this research subjects from the age of 6 (primary school) till adolescents stage (high school) who have higher values on measurement in body fat %, back skinfold, upper arm skinfold and suprapatellar skinfold performed purer result in vertical jump. On behalf of these results it can be concluded that boys and adolescents who are obese and overweight offerings lower effects in basic motor abilities, accurately explosive strength. Saha (2015) similarly investigate the influence of morphological characteristics on explosive power. His results shown that vertical jump is significantly positively correlated with skeletal muscle %, lean body mass, mesomorph and ectomorph somatotype; but also body mass, body fat % and endomorph somatotype are significantly negatively correlated. From the given results Saha also concluded that somatotype and body composition variables are important factors in determining leg explosive power. Furthermore, Marta et al. (2013) examine the impact of body fat and somatotype on explosive strength in the prepubertal children. The data of their investigation applaud that somatotype has a large effect on explosive strength. Specifically, endomorphs have a negative influence on vertical jump gains while mesomorphs have a significant positive influence and that should not be ignored because the majority of body fat can be essential aspects affecting physical condition and normal development. The relationship between anthropometric characteristics and motor abilities of boys from first grade of elementary school investigate Rodić (2012). In his study obtained result showed negative relations between body mass and explosive strength. From that outcome he also concluded that anthropometric features of boys are very essential for the execution of motor abilities. Agreeing to the results of this investigation it can be concluded that for proper physical condition, healthy growth and development it is necessary to regularly monitor morphological features of children. In that period of life, from earliest age till adolescence, it is very important for children to have regular body mass and somatotype to prevent the occurrence of coronary heart disease and diabetes.

Recommendation for further studies is to investigate the relationship between morphological characteristics and other basic motor abilities such as coordination, speed, flexibility, balance and precision. Also it would be interesting to provide the measurements on girls from kindergarten till high school and compare their performance in motor tasks regarding to anthropometric characteristics, specially body fat% and skinfolds. In that case there would be covered the pattern of all children and the entire motor space. Those findings would be of great importance for parents, educators, teachers and trainers who must be a motivating factor in today's era of digitalization. The children must daily exercise and have proper nutrition to be healthy people, and not to spend time sedentary in front of screens.

Abstract

Reform in education requires the national-moral characteristics, traditions, national mentality of our people and the efficient use of progressive ideas in this field in Azerbaijan for many years. Priority areas should be identified by deeper study of existing problems to implement what they are saying. According to the above-mentioned provisions, education reform is solved step by step. At the first stage (1999), organizational work has been done to create a normative legal economic and information base of the new education system that meets the modern requirements, ensuring citizens' right to education. Establishment of organizational, legal, regulatory, personnel, financial, logistical, scientific, educational and methodological and information support for the solution of the problems that provide for socio-economic stability of the education sector and the implementation of large-scale reforms in the second stage covering short-term prospective; the management model is expected to be created.

Keywords: Education, Socio-economic, Learning-process, Reform

Introduction

It is known that one of the main purposes of the education is to bring up highly developed persons on highly level, having got scientific potential, being competitive. Nowadays the personality aspected education policy focuses this factor a bit more. Literally the science about the upbringing, that is to say, pedagogy meanwhile is teaching and new method. Education and improvement deal with definite categories. The teaching process which is the mutual expedient activity of the teacher and learner is also the basic means for upbringing and improve from psychological view point. The maintenance, essence, principles, methods and organizing forms are defined by the didactics. Didactics is a Greek word meaning "I am teaching". This word firstly was brought to the science by the German pedagogue V. Ryashke (1571-1635) and the Czech pedagogue John Amos Comenius (1592-1670). Didactics is teaching process which has inside contradictions. The main point is that those contradictions have got motive power. For example: in the contradictions that arise among the opportunities of those who learn the complicated demands regularly the teaching always outstrip the mental improvement.

In the field of independent state building to bring up highly intellectual leveled personalities is one of the important duties of the pedagogues working in education field. For this purpose on the state program level serious reforms are carried out in the education field. The successful solution of the problem having national importance depends using efficiently from the opportunities of the teaching. The teaching has broad conception, and the quality, the degree of its being carried out, is defined by the formation of the knowledge, skills and habits in those who are taught. Knowledge is the main criterion of the mind, skills and habits are the basic parameters of the mind. The teaching has different steps, that is why the teachers must keep the succession of mastering of any theme in the focus. It can be said that the steps for to make the learners to master teaching themes for any subjects which are taught.

In pedagogical literature there are different opinions about the rules and objective laws. These rules characterize the rules of the teaching according to the mutual relations among the teaching elements (the activity of teacher and student, the theme and duties of the teaching, material and technical, spiritual- psychological environment)

For example, rising of the mastering while the degree of the variety of teaching methods increases applied depending on the features of the teaching theme is called objective law. As a rule it is expressed as following: the rule of the dependence of the mastering from the variety of the teaching methods. Without knowing the rules of the teaching it would be impossible to master the knowledge, skills and habits, it would be difficult to secure their improvement from psychological view point. From other side it is necessary to know that the principles of the teaching are based just on these rules.

“Principle” is Latin word, it is used in the meaning of “basic demand”. The quality of the teaching demands on the rightly usage of its principles. The didactic ideas which give a way to set up the joint activity of the teacher and learner efficiently are called teaching principles. The opinions of the pedagogues are different in what demands to call teaching principles and to define their quantity. To analyze the problem from view point of characterizing the principles of the teaching is according to the reality of the day. It includes the connection of the teaching with life, to establish acceptable environment for the teaching/ taking into consideration the individual features, collaboration in teaching, consciousness and activity, scientific character in teaching, educative feature of the teaching, obviousness in the teaching, usage of the different methods and strengthening of the knowledge and skills. Students’ mastering to definite science, skills and habits under the leadership of the teachers according to the stages of teaching, their bringing up and improving according to the national-patriotism are called the methods of teaching.

One of the functions of the leadership to the pedagogical process is the organization of the supervision to the teaching and cognition activity of those who learning teaching. During the supervision in teaching process the teacher demonstrates his humanist attitude, democratic approach by defining how much rightly the learner answered the question. The teacher’s reaction to the mistakes of the students during the teaching process must be extremely sincere. The observation of the lasting years shows that in most cases the teachers who can’t endure the insignificant mistake display nervousness. During the supervision in the teaching the teacher must be kind and must regularly direct the learners to think about the theme, must inform them about understanding, thinking and working independently including to define their mistakes. The theme of the supervision changes by depending on the character of the subject that is taught, and on the lessons. For example: the teacher who wants to discover the skills on the application of the theoretical knowledge on the practical works organizes the experiments. The supervision in the teaching discovers the inward world of the learner. This time the teacher must pay attention to the learners speech skills, their way of judgment, their skill on analyzing ability of comparison, their logical speaking and other qualities. The supervisions become current/ thematic, dovru. result and in testing forms.

The valuing of the success in the teaching is the criterion defining in what degree the essence of the pedagogical process answer to the interests and needs of consumers/ According to our opinion, electronic accounting machines, the broad application of the test programs to the teaching process, establishing of the education on the new technology, will be able to liquidate such negative cases. During the valuing the knowledge, skills and habits the teacher must take into consideration some pedagogical needs in unity. The purpose, duties, theme and methods of the education have been collected in the organizing system of the teaching. The lesson that has the lasting developing way in that system takes a leading place. The lesson which is the main organizing form of the teaching, is characterized by its important features. The mutual activity at the lesson are characterized with each other. So, during the lesson the ways of the activity of the students under the teacher’s leadership changes. It is necessary to look for the essence of the internal mechanism of the structure of the lesson just in there. If the pedagogical needs for each lesson are carried out that lesson has positive result. Alongside by defining didactic structure at the lesson, the education giving, upbringing and improving aspects must be carried out in unity.

In Azerbaijan to establish new educational system according to the independence and our national ideology, basing on universal values, democratic and worldly principles, improving of its managing, adapting it to the democratic rules depends on the strengthening of state-public features, carrying out self- government principles.

We think about regulation of our activity according to the democratic principles, that is to say about each step we take. That is why not depending their profession each student must perfectly know the forms and methods, the organizing rules of the teaching, and must be active independently according to it/ (2. Page 7)

During independent state building one of the important duties of our pedagogues working in the education field is to bring up highly intellectual personalities. For this purpose serious reforms are carried out in the education on the level of state program. In the pedagogical literature there are different opinions about the rules and objective laws about the teaching. This problem was solved properly by the professor N. Kazimov. He characterized the rules and objective laws of the teaching according to mutual relation between the elements of the teaching (the activity of teacher and student, the theme and duties of the teaching, material and technical, spiritual- psychological environment) .

For example, rising of the mastering while the degree of the variety of teaching methods increases applied depending on the features of the teaching theme is called objective law. As a rule it is expressed as following: the rule of the dependence of the mastering from the variety of the teaching method.

Without knowing the rules of the teaching it would be impossible to master the knowledge, skills and habits, it would be difficult to secure their improvement from psychological view point. From other side it is necessary to know that the principles of the teaching are based just on these rules. Principle” is Latin word, it is used in the meaning of “ basic demand”. The quality of the teaching demands on the rightly usage of its principles.

To analyze the problem from view point of characterizing the principles of the teaching is according to the reality of the day. It includes the connection of the teaching with life, to establish acceptable environment for the teaching/ taking into consideration the individual features, collaboration in teaching, consciousness and activity, scientific character in teaching, educative feature of the teaching, obviousness in the teaching, usage of the different methods and strengthening of the knowledge and skills. Professor N. Kazimov defined the teaching methods as following: Students’ mastering to definite science, skills and habits under the leadership of the teachers according to the stages of teaching, their bringing up and improving according to the national-patriotism are called the methods of teaching.

The reform carried out in the education field demands us to use efficiently from the national-spiritual features, traditions of our people, from the progressive ideas which had been formed in Azerbaijan in this field. In order to realize all what had been mentioned above the existing problems must be studied and priority fields have to be defined. Just according to the thesis mentioned above the education reforms, the improvement of teaching-training process are solved in some steps. In the first stage the organizing affairs related with to establish the normative/ legal economical and information base of the education system corresponding to the modern needs, securing the rights of each citizen to get education. The human beings master the knowledge of the mankind with the help of the teaching which is one of the basic activity/ the teaching activity is regulated in the mutual relations with the psychological processes. Altogether in the improvement of the psychological processes (attention, perception, memory. Imagination, thinking, feelings, expression) the teaching activity plays great role. As a result of the carried out psychological and pedagogical researches it has been proved that different from other psychological processes thinking has more superiorities in mastering the teaching materials consciously and in perceiving its essence. From the view point of the integration the world education system the occurring

approaches, the gained achievements as a result of the teaching activity in the carried out reforms can't be denied.

The personality is formed in concrete life environment in his teaching and training. In this case one of the main purpose and duty of the teaching is to bring up personality corresponding to the needs and demands of the independent Azerbaijan state.

Optimizing of the teaching process, its scientific organization, increasing its effect, intensification of the students activity causes to the quality of the education. By achieving the decrease of the difference between the development process of the people living in the society and the spiritual- psychological and intellectual levels of the people it is possible to establish civil state. Having education strategic influence is related with above mentioned factor. The teachers who teach at the training which was organized related with the new teaching methods use their practical skills. It is important to strengthen the achievements which were valued as the first step, on the republic scale. In the process of carrying out the education reforms the purpose, principle, legal base- which were on the state program must be reflected.

If we analyze the new teaching methods according to their theme the main attention must be paid to pedagogical ability of the teacher to teach the knowledge, skills and habits. From the meaning and essence view point the teaching conception serves to the rules of the choice and application of the new methods by keeping their value. Without approaching the learner as the personality it is difficult to consider him the comprehensive being. By using authoritarian attitude it is impossible to appreciate the essence of the teaching. The second stage embraces short-termed perspiciveness it is supposed to solve the problems providing the social- economical stability of the education field, the organization of legal, normative, cadre, material- technical, scientific, educational- methodical and informative guarantee, and to set up new management model. In the third state all the execution mechanism of the all events meant in the program have been reflected.

It has been planned to carry out some events on the level of the program. Providing of interactiveness in the teaching, the important steps of the teachers in the direction of the innovation carried out in the education is estimable.

The efficiency of the usage of the new methods in the teaching depends on the properly organizing of teacher training. To increase the quality level of the education influence to the essence of subjective and objective conceptions and resulted the collaboration having get new meaning. The experiences of the long years show that the individual having highly thinking ability became passive being lost in the uncertainty psychology. Only the active teaching methods may liquidate this. The application of the active teaching in the pedagogical process is one of the main purposes of the education reform. These methods cause to increase the quality of education have been mastered by the teachers. During the active teaching process the teacher is like a guide, and the learner is like an investigator. The quality parameter of the mentioned technology has been accompanied by the intensification of the thinking activity.

Logical thinking is the ability of comparison, classification and systematizing. Comparison is to define the similar and different features among the things and events. Generalizing is uniting the things and events according to their common and important features. Classification is to classify the things and events for certain features. Systemizing is to replace the objects according to certain rules, to define succession among them.

The creative thinking is the ability of creating the innovation. Creative thinking is the quick-wittedness/ originality of the mind, curiosity to know everything. The quick-wittedness is defined with the number of the

created ideas in some defined time. Curiosity is to accept the innovation and to be interested with everything. Critical thinking is the ability of to appreciate and distinguishing the accepted information. Recently a new pedagogical conception- motivation is often used in teaching. Motivation is the reason that causes activity in the learner. The role of the motivation in the teaching process is to interest, to draw the attention of the learner. In order to carry out active teaching methods firstly the problems must be discovered, the hypothesis must be put forward, the organization of the research must be applied.

There are some ways of creating active teaching. The teacher must carry out those demands in the teaching process. It includes to liquidate the problematic situation, activity of researching, drawing to encourage, to provide the situation for to get knowledge independently. The teacher must be intellectual in order to be able to teach the relation and attitude between the things and events. This process is systematic and is defined by the motives of the direction of human activity. The person who leads to the process of the ruling the pedagogical process must be aware of regulating the brain activity. Up present time the scientist didn't pay attention to this point. During the valuing the knowledge, skills and habits the teacher must take into consideration some psychological and pedagogical needs in unity. The behavior of the learner, the theme of the knowledge, defining of marking objective and fair during the academic are conditioned. Depending on the level of the success it is possible to define the teacher's work. The purpose, the theme, the methods of the education have been collected in the organizing system of the teaching. In that system the lesson takes the leading place. The type and structure of the lesson is related with each other. In the structure of the lesson there are external and inside features. In all, in the higher educational institutions the joint activity of the teacher and the students the experiences, physical preparation are one of the important factors. During the period in which we are integrating the world education system there arises need for to use new technologies in the teaching. The relations between the teacher and the students, the democratic opportunities given to the students during the teaching process broaden their independently activity. The new technologies are the demand of the period, that is why we must use them. From other side, while replacing the national value, the achievements that we had got from the historical experience we must be attentive, and must regulate everything properly.

Abstract

The training of top-level specialists should be clearly and flexibly linked to technological and innovative changes in the national economy. The structure of professional training should correspond to the structure of demand for them from the public sector and large and medium-sized entrepreneurs. This means that the educational system should be closely integrated into the national economy of Azerbaijan, sensitively catch the ongoing innovation changes in higher universities of Azerbaijan. This paper considers some of the problems of higher education and directions to solve them in Azerbaijan, as well as the issues of implementation and improving new teaching methods in universities, in particular at Azerbaijan State Economic University (UNEC). The authors systematized having experience in the following disciplines: Organizational Culture, Behavioral Sciences, Business Ethics, Negotiation Techniques, Business Organization and Management, Technology Management, Innovation Management, Strategic Management in various The universities of Azerbaijan (Western University, Baku University of Business, Azerbaijan’s Private University, Azerbaijan Institute of National Economy under the Cabinet of Ministers of Azerbaijan, SPAA, Azerbaijan State Economic University, etc.) also offered a number of recommendations: The guidelines for improving the process of innovative transformations in the educational process.

Keywords: Innovative changes, Higher education, Approaches, Traditional and innovative teaching methods,

Introduction

The educational system should be closely integrated into the national economy of the country, sensitively catch the ongoing innovation changes and adapt to them, respond to the current trends in the technological and innovative development of the national and world economy. Consequently, the use of innovative techniques and teaching methods will contribute to the improvement of qualifications and skills of students and undergraduates, improve the quality of education in Azerbaijan.

The paper analyses the statistical data of higher education in Azerbaijan for 2000/01-2017/18. All issues related to the training and application of new methods in the educational process were revealed by the authors while teaching in various universities of Azerbaijan (Western University, Azerbaijan Private University, Baku Business University, Institute of Management of National Economy under the Cabinet of Ministers of Azerbaijan Republic, also School of Public Administration in Azerbaijan - SPAA, Azerbaijan State Economic University (UNEC)).

The main research questions are as follows: How is higher education developing in Azerbaijan? Does the Azerbaijani government support higher education? Is the quality of higher education in the republic enough? Does the higher education of Azerbaijan attract foreign citizens? Does the Azerbaijani government support young citizens leaving abroad for higher education? Do the government and top managers of universities support training courses for lecturers and trainers? Do teachers use the innovative teaching methods? What innovative teaching methods are used to train specialists for the national economy? What problems exist in the educational

process? What can be improved in the educational process of future economists? What innovative techniques and methods need to be introduced into the learning process?

Method

The following research methods were used in this paper: observation method, data grouping method, statistical analysis method, data comparison method. The authors gave an expert assessment using SWOT analyses.

Findings

Socio-economic analysis of higher education in Azerbaijan and its state support

Recently, higher education has become an important factor in the competitiveness of countries. Each country is forced to train personnel with a high level of education in order to prepare the basis for innovative transformations, which in turn not only develops the national economy, but also strengthens its position in the global market. Estimates by specialists from the Organization for Economic Cooperation and Development (OECD) confirm that education costs are very, very high-yielding investments that pay off several times (Yakovleva, 2009).

The process of education as an economic category interacts with various sectors of the national economy and economic and production activities. In this case, all resources (labour, technology, materials, as well as raw materials, energy, information resources, etc.) are combined in a single process of reproduction and reproduction of the total social product (Hamidov, H.İ., Huseynli, AT Shamkhalova, S.O, 2016).

In the process of education, human capital is formed and modified. The formation of human capital in Azerbaijan plays an important and priority role for the state. These government measures are treated as "Azerbaijan's Development Concept - 2020: outlook for the future» (Azərbaycanın İnkişaf Konsepsiyası-2020: gələcəyə baxış ", 2012)," National Education Development Strategy of Azerbaijan Republic» (" Azərbaycan Respublikasında təhsilin təhsilin inkişafı üzrə Dövlət Strategiyası ", 2013), Laws of Azerbaijan "About Education "(Təhsil haqqında", 1992) and "About Science" (Elm haqqında, 2013).

During the years of the restoration of the sovereignty of Azerbaijan the number of students, also the number of foreign citizens studying in the country's universities has increased. As can be seen from table 1. the number of bachelor students in the academic year 2015/16 increased by about 27% compared with 2000/01. Over the same period, the number of bachelor students in the group of agricultural specialties increased (approximately 82%). The indicators of next group specialties also increased: in economics and management speciality - approximately 37%, in technical and technological sciences - approximately 29%. During the same period, the proportion of bachelor students in specialty groups of natural sciences decreased (approximately 44%). At the same time the share of bachelors on speciality humanities and social sciences decreased (approximately 51%). As can be seen from table 1. the number of bachelors increased by about 15% over the academic years 2015/16-201 /18. The increase in the number of bachelors was observed by groups of specialties in agriculture - about 49%, for natural sciences - 14; for economic disciplines, also in the humanities and social sciences - about 15%, for technical and technological disciplines - about 16%.

Table 1.Number of bachelors, who have education in state and non-governmental universities of Azerbaijan (men). (<http://www.stat.gov.az/source/education/>, 2019)

Years	2000-2001	2010-2011	2015-2016	in 2015/16 to 2000/01, in %	2017-2018	in 2017/18 to 2015/16, in %
Number of students- bachelors, total-men	26403	29904	33645	127.28	38546	114.56
Of them on speciality:

Etc.	3648	11517	12822	351.48	14816115.55

As can be seen from table 2. for the period 2000/01-2015/16 the number of masters in the humanities and social sciences has decreased (about 42%), but the proportion of graduate students in all other areas of education has increased: in the natural sciences by about 75%, in agriculture - about 163%, in economics and management - 213%, on technical and technological disciplines - about 40%. According to the data of table 2. the increase in the number of masters was observed for the period 2015 /16-2017 /18 (32%). The number of masters in natural sciences increased by 45%, in agricultural disciplines approximately 24%, in economics and management - 12%, in the humanities and social sciences approximately 35%, in technical and technological disciplines by 68%.

Table 2. Number of masters, who have education in state and non-governmental universities of Azerbaijan (men). (<http://www.stat.gov.az/source/education/>, 2019)

Recently, the number of foreign students receiving education in Azerbaijani universities is growing every day. For example, republican universities prepare specialists not only from CIS countries, but also from abroad in the field of oil and gas production and refining, for the petrochemical industry, for the industry of petroleum engineering, in the field of oil shipping, military science, in philology, history, in mathematics and in other disciplines. Note that the area of the countries is the most diverse and covers almost the Earth world (from the USA, Canada, Latin American countries to China, from the countries of the African continent to European countries).

For the period 2000/01 - 2017/18 academic years, the proportion of the number of bachelors and masters combined increased by 128.3%. But for the period 2010 /11-2017/18 years the proportion of students from Russia increased by 151.8%, from Ukraine - 300%, from Kazakhstan - 66.7%, from Turkmenistan - 70%, from Uzbekistan - 6.3 times, from the USA 5 times, from Georgia - 136.4%. Unfortunately, the proportion of students from Turkey has decreased (by 32%).

According to statistics, over the past 18 years, the number of Azerbaijan citizens receiving education abroad has also increased. The number of Azerbaijani youth receiving higher education in foreign countries has increased almost twice (period 2000 /01-2017 /18). The period 2010 /11-2017/18 years differs by particular activity of various educational programs from Europe and Asia, which particularly influenced the growth of the number of students studying abroad. The growth in the number of students in the USA from Azerbaijan is especially noticeable (this indicator has increased by twice), in Canada (280.5%), in Germany - 116%, in the UK - 112, 5%. Unfortunately, the number of students receiving higher education in Turkey has noticeably decreased by 32%

It should also be noted the role of state support in obtaining highly qualified education in Azerbaijan. According to the "State Program for Teaching Higher Education of Azerbaijanian Youth in 2007-2015" of December 31, 2016 State Oil Fund of the Azerbaijan Republic receive a grants for 3,302 students who are educates not only in European states, but also in Canada. About 29% of the total number of bachelor and master students are educated in Great Britain, in Turkey - 22.1%, in Germany - 12.4%, in Canada - 7.2%, in the Netherlands - 5.2%. About 4 % of bachelors and masters are educated in Russia ("The State Programme on Universities in 2007-2015", 2015). It should be noted that the majority of these are masters (79.0%) (Manafova, 2013).

A significant part of masters receive higher education mainly in economic specialties. The most popular among young people is the specialty “Economics and Management” (722 people in 2017). In second place in popularity are specialties related to engineering knowledge (138 people in 2017). There is also interest in the legal sciences (120 people in 2017) and the ICT field (118 people in 2017). The same situation can be observed among bachelors (“The State Program on 2007-2015”, 2015).

Many alumnus, when returning home, work not only in foreign companies, but also in higher education sector of Azerbaijan. The first pioneers among them were graduates of the one-year course of top managers from Turkish Istanbul University since 1991, graduates of Istanbul University on the VAQF’s pilot project of the Turkish World Research Foundation in Baku, who also received a master's degree in Turkey and worked as teachers in the Azerbaijan Institute of Management of National Economy under the Cabinet of Ministers of the Republic of Azerbaijan since 1997.

In Azerbaijan Institute of Management of National Economy under the Cabinet of Ministers of Azerbaijan Republic was also organised the three-month course of market economics’ course by the professors of the Kiel University of Germany. There in the period 1994-1997 was organised the three year course of “Public Administration and Management” under the TACIS programme. Lecturers and Trainers from Nottingham Trent University (Great Britain), the University of Maastrich (Netherlands) and the Institute of Management of Ireland delivered the disciplines in Economics and Public Administration to trainees from Azerbaijan. At the end of these courses was established the School of Public Administration in Azerbaijan (SPAA), whose senior teachers taught modern methods and techniques in economics and management to senior officials of the Customs Committee, the Ministry of Taxation of Azerbaijan, employees of the Central Bank and other organizations in 1995-2001. Nowadays, many graduates of these courses teach at Azerbaijan State Economic University, at Baku State University, at Western University, at Baku University of Business, at private university Azerbaijan, and others. Since 2001, senior lecturers of School of Public Administration in Azerbaijan (SPAA) and teachers who graduated from the Istanbul University faculty began working in the Business Administration faculty of the Azerbaijan State Economic University (UNEC).

Since 2004 various programmes of the European Community and Asia suggest to Lecturers and Researchers of Azerbaijan State Economic University (UNEC) some advanced training. For example, according to the latest data from the UNEC website, a vacancy is open for receiving scholarships for research and internship at the Kong-Gong University of Japan, at universities in South Korea, and at universities in Turkey. Every day the number of teachers who have received higher education abroad is growing whose actively use the innovative teaching methods and techniques in practical classes and lectures.

Students enrolled in undergraduate and graduate programmes also have the opportunity to receive additional education in universities in Europe, Asia, and the America continent. According to the latest news from the UNEC website, they have the opportunity to study from the third year at French Montpellier University, London Scholl of Economics and get a double diploma in education.

Innovative techniques and teaching methods implemented in Azerbaijan State Economic University (UNEC)

In conditions when the formed education system (“supporting education”) is gradually being replaced by an innovative education model (“creative learning”) more of trainers and tutors are looking the new teaching methods in the educational process. In this process have been changing the requirements to all interested persons of education: tutors, teachers, trainers, students, administrative staff of university, finally all educational system.

As can be seen from the Scheme 1. the traditional system of education goes through several stages on the path of improvement. Training on the basis of indispensable involvement in the environment of thinking in the 1960s of the last century proceeds to the training of practical skills on the basis of such training seminars as case studies, business games, learning systems. Since the 1990s the educational process has transferred to a new stage of learning - the development of interactive courses using personalised multimedia systems (Personal computers, mobile phones, distance learning, etc.). Further technical improvements should be replaced by an educational process based on the tet-a-tet technology of a student with a trainer or teacher using various socio-psychological

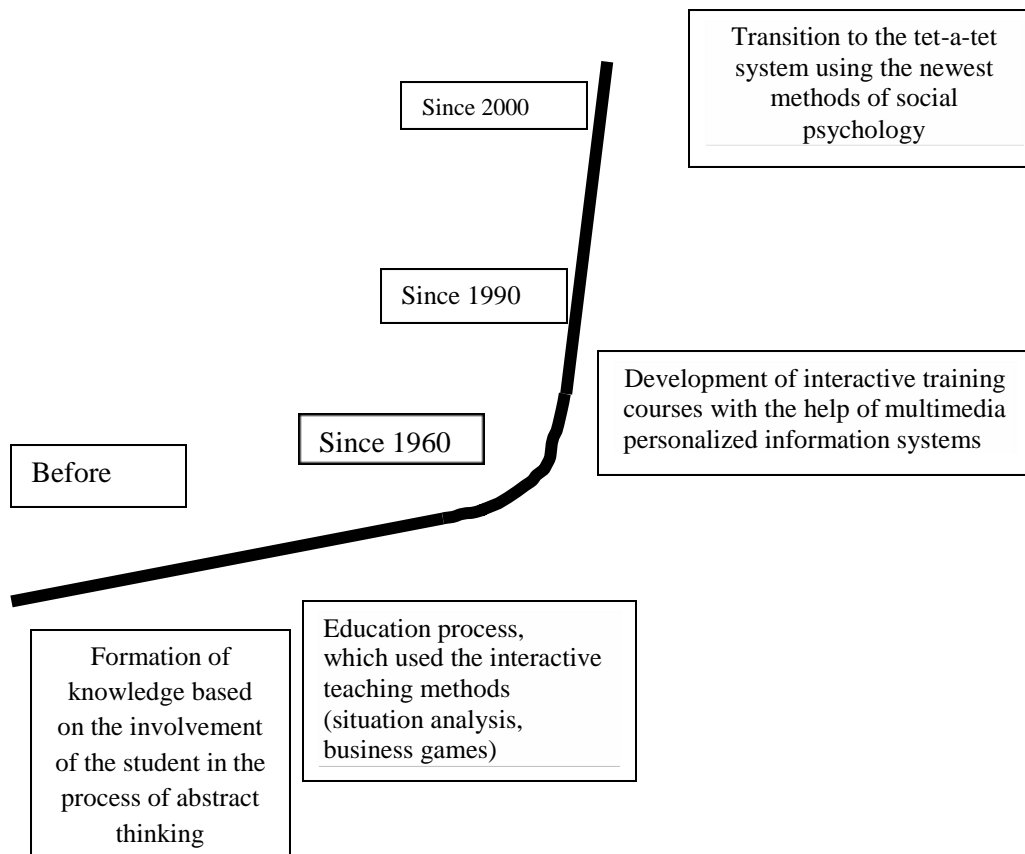

methods of teaching.

The educational process, which actively used the Soviet system, has some drawbacks:

- Classroom education system - the transfer of knowledge through a survey lesson - does not meet modern requirements for the use of creative activity;
- Education programmes are mostly dogmatic in nature, not adapted to actively changing conditions of reality;
- The methodological base of textbooks is so outdated that many scientific achievements and recent discoveries are not reflected in them;
- There is no proper motivation of the average student for independent thoughts and actions, i.e. to the ability to develop independently and to replenish existing knowledge.

In this context, schools and methods of developmental education, which teach the dynamic perception of reality, are of great importance. The specificity of the education system should be manifested in its ability not only to provide the student with knowledge, but also to form the need for continuous mastering them, i.e. develop the skills and self-education skills. In addition, for the purpose of productive professional activity, it is necessary to instill in students such important qualities as creativity, independence, enterprise, agility, stress resistance. To this end, since the 90s of the last century, they began to use innovative, reflective business games, in which situations of choice and decision-making are modeled.

Scheme 1. Education process and requires to its development.

If we take into account the fact that new psychological tests and business games have been actively used in the educational process in the spatial context of the former Soviet Union since the 1980s (they cover the period of creating interactive educational programs taking into account multimedia tools and information technologies, as

well as tet-a-tet based programmes' learning which using various socio-psychological techniques), the active use of psychological techniques in teaching and in the educational process has now become not only fashionable, but also necessary condition of the process of interactive learning.

These processes include the use of an immediate survey of students according to the method of the Mentimeter system, the joint design of the business plans of students under the guidance of a trainer. The use of interactive forms of learning, such as testing after a lecture, e-consultations, and e-learning, helps realise the benefits of learning: mobility, interactivity, memorability, flexibility in use, accessibility, reduction of training expenditures (Yakovleva, 2009).

Now, in all developed countries of the world, a lot of attention is paid to the process of socialisation and upbringing of new generations of society. Scientists distinguish two fundamental approaches in pedagogy: nature conglomeration or cultural conglomeration; following the child's "natural" nature or obeying its culture? The scientists' answer is led to a single goal. At the same time, the goal of education is to lead to culture (improvement of the student's positive creative qualities), and the method of education should be based on the nature of the student (identification of generic, external, internal psychological negative factors and their correction in a positive direction).

As can be seen from table 3. only strong students are able to better adapt to the new world requirements of training, and weak students perceive all innovations as a blow to their ego and actively resist innovations. Students with average statistical knowledge at the beginning watch for innovations in education with caution, but after adaptation they perceive these innovations positively.

Table 3. SWOT Analysis of Innovative Training in High Education School of Azerbaijan

Strengths	Weaknesses
<ul style="list-style-type: none"> ➤ Developing the ability to think independently and make decisions; ➤ Strong students gain independent work experience; ➤ The Lecturer or Trainer can control not only the student's behavior, but also the process of their thinking. 	<ul style="list-style-type: none"> ➤ Weak students do not gain independent work experience; ➤ Students' self-control may be weakened; ➤ Not all tasks are completed on time.
Opportunities	Threats
<ul style="list-style-type: none"> ➤ Teaching time is shortened by increasing attention to detail; ➤ There is a sincere interest in the subject of study. 	<ul style="list-style-type: none"> ➤ With the strengthening of social ties between students, ties with teachers deteriorate. ➤ Lack of control can contribute to laziness;

Using the new approaches of learning in their course (business games, case studies, testing, etc.) the trainer and teacher can adjust the subject of their subject according to the interests of students and their level of preparedness; pay attention to the overall level of assimilation of complex topics; focus on clarifying topics that are difficult for students to understand. In addition, a poor student has a chance to take the exam several times until he reaches the desired result.

Using the new approaches of learning in their course (business games, case studies, testing, etc.) the trainer and teacher can adjust the subject of their subject according to the interests of students and their level of preparedness; pay attention to the overall level of assimilation of complex topics; focus on clarifying topics that are difficult for students to understand. In addition, a poor student has a chance to take the exam several times until he reaches the desired result.

Results, Conclusions

Prestigious models of higher education are the Chinese model, and the European education system, each of which has its own content, principles, values and specificity. Basically, the formation of a high level of higher education should be based not only on a high level of higher education with the support of the government, on scientific and technical cooperation and cooperation of universities of the whole world.

For the formation of a quality higher education Azerbaijan transfers to implementation of principle of openness, not limiting the student in time and spatial framework: the student gradually develops into a subject who decides for himself what disciplines and when he can study and when he can pass the exam. And it forms the autonomy and sense of responsibility of the student, taking into account his individual personality characteristics.

The development of cooperation and interaction of universities is possible in terms of joint scientific research developing. For this purpose inter-university laboratories are being formed as centers of collective use, interuniversity departments are being created, regional centers of quality management system certification are being formed, programs for the export of educational services (training programs for bachelor and master) and technologies (distance learning programs, interactive business games using information technologies) are being developed which will contribute to the development of innovation activities in the country.

Higher education should be based on using of information and communication technologies, on development of network distance learning methods. The creation of joint information resources contributes to developing of educational technologies and the implementation of e-learning, the introduction of innovations and the acquisition of positions like as the regular customer and the regular provider of educational, scientific and methodological services, consultations, etc. It should be noted that information technologies only enrich the learning process. Management of the learning process remains with the teacher and trainer. Only the teacher organises the procedure of contact with the student during consultations or through communication on the Internet.

Using the innovative learning techniques the teacher works as an expert and consultant (tutor, moderator, mentor) who helps to student to navigate the world of various information. With the expansion of the circle of consumers of educational services the encouragement is used as a method of active self-realisation among students.

Innovative characteristics of new teaching methods are as follows:

- 1) to use the irrational (inherent in the East) and also rational (inherent in the West) analysis methods in study and in research;
- 2) to support of constant attention and interest of students on the situation being analysed;
- 3) to use of non-standard methods of analysis;
- 4) to develop of students' creative approaches in identifying the details, as well as resolving the proposed situation.

It is necessary to note Azerbaijan high education system has got some problems that still need to be solve. Unfortunately, higher education in Azerbaijan has a number of shortcomings, which include the following:

- There is no unification in education programmes for various disciplines, which creates certain difficulties for students, especially for students of private universities. These disciplines mainly include new educational courses in economics, sociology, psychology, information technology, and philosophy. There are no uniform textbooks, especially in Azerbaijan language;
- Some knowledge is not adjusted in accordance with the temporary stage of social development, some lectures contain old topics, the methodological base of education is weak. Many students are not familiar with the scientific achievements of Azerbaijanian and other Turkic-speaking, Islamic scholars of the middle Ages. For example, many do not know that the founder of sociology was Ibn Haldun, the scientific heritage of Aristotle and the ancient Greeks was restored thanks to the abstracts of Al Farabi (for example, look at the course “Behavior”) (Abasova, 2007);
- With the development of information technology more students use telephones and smartphones and they pass valuable information past the ears. There are no teaching techniques using students' mobile gadgets, which would contribute to their active involvement in the educational process;
- The principle of learning “a student must able to apply acquired specific knowledge in his future profession” is gradually replaced by the principle “a student must select resources-knowledge to adapt to new conditions and be able to find and correctly use various options for solving life problems”. The task of the faculty, management and specialists of high schools is to create and form the new schools and methods of developmental education

that teach the dynamic perception of reality;

➤ Not all foreign diplomas from foreign countries are accepted by the Ministry of Education and the Higher Attestation Commission of Azerbaijan Republic. If this issue is resolved by bilateral agreements between the CIS countries, then there are no agreements between Azerbaijan and other European countries and countries of the Americas which creates some obstacles in the identification of BSc's., MSc's. and PhD's Diplomas.

Recommendations

The implementation of innovative techniques and methods of functioning in universities' administrating create some opportunities and prospects for accelerated access to new markets. The development of information technology contributes to the network interaction of the educational process, reduces expenditures; expands access to information not only in the network of the university itself, but also in the networks of the university partners. And it promotes the sharing of risk among network members, strengthening cooperation ties.

Summing up, we note that Azerbaijan, being exactly in the middle of the Eurasian continent, at the junction of Europe and Asia, between the Christian and Muslim worlds has a wide potential for implementation of teaching different methods. And in turn, Azerbaijan develops traditional areas of science - mathematics and higher mathematics, philosophy, philology, archeology, history, learning old languages as well as geophysics, chemistry, mineralogy, and other disciplines. But, unfortunately, Azerbaijan has not yet created its own development model in the field of higher education. The need to create and form a national model of higher education is a priority task for the society and universities of the republic.

The preparation of specialists with higher education is an interacting system that determines the consideration of the features of the educational process throughout the world. It is necessary to take into account the fact that in the context of globalisation many young people who focused on career growth prefer to receive a higher education that can compete with the best European standards. For this purpose, it is necessary to form such a model of higher education in Azerbaijan that could train specialists not only for the CIS countries, but also for Europe and the whole world. It is necessary to create the structure which will be cooperate university and research institutes' activity on the example of the Research State University of Nizhny Novgorod of the Russian Federation (www.unn.ru, 2019).

The authors suggest that the creation of an information base about specialists who have been trained abroad and working in the universities of the republic is one of the first steps for the formation of the faculty. Secondly, it is necessary to form groups for creating shells for content as part of network specialists in various disciplines. Thirdly, it is necessary to continuously update and improve training programmes, business games, programmes for analysing a specific situation for sale through the information network - SKYPE, WHATSUP, etc. Fourth, it is necessary to develop scientific and technical cooperation in developing joint training programmes with the CIS countries. Fifth, it is necessary to adjust the system of knowledge assessment and testing the level of competence, to form a unified system of knowledge assessment.

Abstract

The purpose of lifelong education is the constant creative renewal, development and improvement of each individual throughout his life. By lifelong education, we understand not the mechanical movement of a person from pre-school to general secondary, professional or post-graduate education, but the harmonious process of cyclical renewal of personality at each of the indicated stages of development. At the present stage of development of scientific and technological progress, information technologies are coming to the fore. This study will address the problem of introducing innovative processes in lifelong education, namely the introduction of distance technologies into the system of lifelong economic education. Economic education, economic literacy of the population at the present stage are one of the sources of increasing the intellectual potential in the regional economy. Increasing competition in the labor market, the restructuring of the economy, the introduction of new technologies in production - all this contributes to stimulating self-employment, training and retraining by occupation, increasing the demand for training in the economic profile, the demand for economic knowledge. The transition to the market creates many problems in organizing the training of specialists at various levels. Continuous, but also regulated flow of well-trained and qualified personnel has always been and will be one of the most important, inalienable conditions for economic and industrial development. Industry and the economy in all countries have long recognized that vocational training is an investment in itself, since the quality and level of standards for products and services largely depends on the qualifications of the relevant personnel, on human resources that can be developed on a broad educational basis.

Keywords: Lifelong Education, Distance Learning, Economic Education, E-Learning, Teaching

Introduction

Modern humanity is at a turning point in the worldview, changing the basic values of technological civilization, the transformation of the scientific paradigm. Our society is undergoing significant changes associated with the revision of a number of scientific, political and social issues. They occur in all spheres of social life, affecting all public institutions, including the institute of education. In this connection, changes are taking place in the educational system, both initiated by the system itself and under the pressure of changes in other spheres. One of the components that make up the goal of education today is the improvement of a person's professional and spiritual qualities through his entry into the innovation value system, and his active involvement in the information culture. In modern conditions, when the amount of knowledge necessary for a person sharply and quickly increases, it is important to inculcate the ability to independently replenish their knowledge, to navigate the rapid flow of scientific and political information. This means that it is necessary to develop mechanisms for advanced training, the principles of its continuity and independence. The world education system is going through a transitional stage in its development and a radical change is taking place in many academic systems. Under these conditions, the need to establish a new education system that meets the requirements of the time is relevant for all states.

In the current socio-economic conditions, one of the tasks facing the education system is to provide high-quality and affordable education to wide sections of the population. The solution to this problem facilitates the distance form of education. Day by day in the world rapidly growing number of educational institutions are to varying degrees using distance learning. Lifelong education has always been considered as a priority issue arising at the present stage of technological development, and taking place in the world's political, socio-economic and cultural changes.

The introduction of new information technologies has led to increased attention to the development of distance learning. The experience of many countries of the world community shows that distance learning is an effective form of improving the quality of training specialists in education centers. Distance learning provides effective self-development for students. For the successful development of distance learning at the university, it is necessary to ensure appropriate organizational and pedagogical conditions. It significantly expands the number of students, provides them with the skills and motivation to improve their educational status throughout their lives. It is not by chance that many researchers express the opinion that distance learning in the near future may become the leading form of training specialists. In addition to improving the effectiveness of training, it will provide the learner with the necessary knowledge and practical skills to find and use the necessary information on the global Internet. Without such knowledge, it is difficult to imagine a competent professional not only in the near future, but even today.

The use of computer technology in distance education of students allows them to improve its cognitive processes. The introduction of distance education fundamentally changes the role of teacher-student positions. With the traditional form of education, the teacher acts as an interpreter of knowledge. With the growth of the educational space, the function of the interpretation of knowledge is assumed by the student, and the teacher is the coordinator of this knowledge. He consults students, guides the work of the student's cognitive processes, that is, assumes the functions of supporting the student's professional development. [1c.50–53] The study allowed us to represent certain conclusions, to develop the following recommendations and suggestions.

Having examined the history of the development of distance learning, we believe that the main premise for the development of a distance learning system is its integration capability. Nowadays, it is impossible to concentrate in every educational institution all world information means stored by mankind in the scientific and educational space. Consequently, it is necessary from every geographical point of the planet where the learning process is organized, to provide deleted access to information resources located in any other geographical spot. Distance learning makes information resources effective spreaded across different territories. This is the conceptual justification and ideology of the need to develop distance learning.

The immediacy of creating a distance learning system in Azerbaijan presently is caused by many factors. This is the recollection of scientific and technical centers in large cities, the formation of new needs of the population in relation to the maintenance, and technologies of education, the development of a market economy, the enlargement in migration of the population, etc.

However, there are problems in the development of distance learning in Azerbaijan:

- The level of computer literacy in the country leaves much to be desired;
- there are not enough people who have a computer connected to the global network at their disposition;
- teachers are used to traditional forms of education and yet are not ready for technologies of distant teaching of educational disciplines;
- distance learning requires a different organization of the educational process, other teaching ways than the traditional system;

- it takes time to teach the teaching staff how to use new educational technologies;

Distinguished problems in the distance learning system must be solved. Specifically:

- it is necessary to more clearly determine the features, principles and peculiarities that characterize precisely the distance learning;
- to characterize the didactic principles and methods of such training;
- it is necessary to determine the requirements for the content, forms, for the educational and methodological assistance of distance learning;
- set out the principles of organization and management of the educational process;
- develop the requirements for logistics;
- improve the regulatory basis;
- develop requirements for technology training in the Internet environment, requirements for telecommunications environment;
- certification of the institutes (universities) of distance education, virtual universities;
- should be taken into account - the fact that not all specialists in different specialties can be fully trained in distance technology.

Having researched the points of view of scientists in relation to the concept, “distance learning” and “distance education”, we believe that distance education is a complexly organized system, referable to a fairly new form of education, able to satisfy the educational needs of the population regardless of its spatial and temporal location regarding to educational institutions, including funds, the process and the result of educational standards carried out by a telecommunication technology teacher and student, which is performed in a specific educational environment, and distance learning is a new form of education in Azerbaijan, which at the moment exists along with other forms of education - full-time, part-time, external in the system of continuous education. Distance learning is a system and learning process in which the teacher and the student are at a distance from each other, and therefore rely on electronic means and printed manuals for organizing the educational process.

Distance learning as a component of the educational process is based on specific theoretical principles, practical experience and methodological principles. Thus, the addition of a distance learning system with the principles proposed by the creator and their precise and exact implementation guarantees the quality results of a distance learning system. It is necessary to continue the practice of conducting experiments in distance learning in order to study the factors determining the strengthening of the multivariate development of distance education in Azerbaijan while ensuring its high quality, as well as its association within the national and global educational process in a globalized market and international contest in this area.

Over the past decade, practice has shown that Azerbaijan has a powerful system of distance learning, especially in universities, where serious attention is paid to reforming the existing system of education. All educational institutions have a pronounced property of openness and personal touch in the process of organizing and conducting distance learning. The structure of the distance learning system at the educational institution level is centralized, consisting of the Distance Learning Center based on the leading university, the Distance Learning Faculty, the Distance Education Institute, the Distance Education Department and the remotely located educational and consulting centers. The distance learning process consists of variable contact and non-contact learning intervals. In all occasions, the last predominates in time, and the contact period may be absent altogether.

It is necessary to improve and reconsider the curriculum taking into account current and future requirements. Since promise is a fundamental principle in improving the system of distance learning. New interesting forms,

methods and means of training will guarantee the most effective accomplishment of the goals set - the formation of professional and educational skills and abilities, the cluster of initial professional experience.

Improving the system of control and impulse in the process of distance learning is simply necessary. Control over the mastering of educational material should be carried out frequently (at least once a week). We believe that it is advisable to strengthen self-control using tests. The problem of distance identification of the student's personality is removed when using videophones and video conferencing. It is necessary to more thoroughly examine the psychological problems in the implementation of distance learning and the outcomes of their use in the educational process. In the system of distance education, moral and psychological preparation of students is very important.

Summarizing all the above, we can say that distance learning at the present stage of development of the economy, science and technology is relevant and timely. The distance learning system should not stand in one place. It is necessary to develop and improve it in diverse organizational areas, starting with the training system and ending with the ways of control and motivation.

Changes in the social environment are closely related to the change in technological trends at different stages: - Stage 1 - pre-industrial society in which there existed - human communication organization based on analog thinking; - Stage 2 - Information Society with a computer organization - communication based on digital thinking;- Stage 3 - a creative society with a social organization of communication; and - hybrid thinking. The modern society of the XXI century is at the stage of changing the technological paradigm. Information technologies, which determined the image and essence of the twentieth century, give way to technologies that open a new path of development - the economy, education, new society.

Changing the learning environment: the transition to a wireless network, the spread of smart terminals, the progression of remote devices, the expansion of SMART work (mobile office) is a new quality of society, in which the combination of using technical means, services and the Internet by trained people leads to qualitative changes in interaction subjects, allowing to obtain new effects - social, economic and other benefits for a better life.

The learning environment is the convergence of ICT and the Internet infrastructure (the fusion of on-line distribution of software and content in the form of multimedia). The structural part of the implementation of this idea is the introduction of e-learning into the system of professional development of teaching staff. The main reason for the relevance of the introduction of training is the need to improve the existing education system in accordance with the new requirements of the economy and society. The main direction of the introduction of training is the formation of information-communication and technological competence of educators in the electronic environment. With the introduction of e-learning, conditions will be created for the realization of the proclaimed UNESCO principle of education of the 21st century "education for all" and "education through life" - "Life Long Learning (LLL)". Electronic distance learning will increase the accessibility of educators education "always, everywhere and at any time", provide an opportunity to independently develop the trajectory of professional growth, equate the level of education of educators of urban and rural schools, open the way to the international educational space. The main goal of distance learning is to create an environment that provides a high level of competitive education by developing students' knowledge and skills of the 21st century modern society: cooperation, communication, social responsibility, ability to think critically, solve problems quickly and efficiently. In the course of the implementation of the above tasks for the institutes of advanced training of pedagogical personnel, the question arises of how to teach modern educators in the light of advanced training in an electronic environment with distance-based technologies. Distance learning is flexible learning, which implies a large number of sources, maximum variety of multimedia (audio, video, graphics), the ability to quickly and

easily adjust to the level and needs of the listener using mobile devices. Distance learning should be easily managed in order to ensure educational organization flexibility of the educational process, and integrated with external sources. The need to develop an integrated intellectual educational environment is based on a sufficient degree of development.

We are obtained the following scientific and practical results: - as a result of studying the works of foreign authors on the problem of distance education, it was found out that at present there are many opinions about distance and electronic education, but there is no single accepted definition; - clarified the definition of distance education in this work; - the main tools of Internet marketing were highlighted, their main characteristics, as well as advantages and disadvantages were stated;

In this paper, we investigated the distance model as an innovative teaching method. The history and development of distance learning was reviewed, and earlier forms and various distance learning technologies, such as radio, television, interactive videos and the Internet, were studied. Synchronous and asynchronous teaching methods were also studied.

In the “State Strategy for the Development of Education in the Republic of Azerbaijan” Approved by the Decree of the President of the Republic of Azerbaijan on October 24, 2013, the development of education in education takes an important role. One of the important strategic directions envisages the creation of an educational infrastructure that meets modern requirements and ensures continuing education. This area covers such measures as the creation of an infrastructure in educational institutions, an appropriate teaching methodology based on information and communication technologies, streamlining the network of educational institutions, distance education, education and development for talented children and children in need of special care, education of the elderly, regional universal centers providing counseling services on vocational and educational issues, vocational training centers and complexes with modern software, the creation of campuses.

Method

Method of the research:
analysis and synthesis, comparative, deduction and induction

Results, Conclusions and Recommendations

Distance education with the development of modern technologies is becoming increasingly attractive for students, for representatives of universities, for the state and for society as a whole. At the same time, the desire of many institutions for interactivity and two-way contact of students with a teacher becomes noticeable. The rapid spread of new technologies in the near future is able to realize ideas that today seem unreal.

The weight of the state in the world is determined by the proportion of the use of information technology in the economy of the state. There is a need for a fundamental restructuring of the entire system of training and retraining of personnel in order to ensure its greater mobility, to address the issues of priority training. Vocational education and vocational training should be focused on the training of specialists who are able to ensure progress in the development of their industry. The rapid development of the modern labor market requires a new type of employee: versatile knowledge, excellent special training, an open, inquisitive world view, the ability to adapt to new situations, constant changes, knowledge of foreign languages, computers, new information technologies, and the willingness to develop knowledge to new situations - all this suggests that education should be focused on anticipatory specialist training, on lifelong education, on broad knowledge, on awareness second, that there will be a job for life. Lifelong education is a requirement of any company. The sooner a person has formed the ability of self-education, the more interesting it is for the employer. The loss of jobs, previously perceived as a tragedy, has become commonplace today. The labor market puts a person in a

situation where he is forced to start anew each time, facing new demands. Thus, it is clear that the most important form of self-realization of the individual in the labor market is vocational education. A diploma itself is not sufficient, because it is not converted into wages in the labor market. Business is in great need of specialists, but it is important to have not only formal educational qualifications, such as a diploma, but also real skills, knowledge and skills that meet the standards of the labor market. In addition, a business career is associated with the willingness and ability to learn. Therefore, flexibility and mobility are the basic educational traits of the individual, giving her the opportunity to stay and advance in the labor market and that are most effectively developed on a broad educational basis. Therefore, intensive educational technologies are needed that would maximize the ability of self-learning. The sooner a person develops the ability of self-learning, the more interest he will present to companies in the labor market. Therefore, it is necessary to create new models of education related to real labor market standards, offering modern educational technologies that provide these standards. Only a flexible and mobile specialist, ready for continuous self-study, will have high competitiveness. Such educational technology, providing a high level of development of the ability of self-study, are distance technologies in education.

Abstract

As we know, one of the lifelong learning forms, which is the correspondence education, has received a wide circulation in our country. However, we have recently mentioned that the type of education should be adapted to modern conditions. As a way out from this situation, the article analyzed the specifics of the distance and supplementary education in the world and the stages of development. Mechanisms of application of existing educational technologies in Azerbaijan were studied. In order to achieve the goals mentioned in the article, the relevant legislation of Azerbaijan has been prepared and recommendations for institutional reforms have been prepared. In the context of globalization, the development of new technologies has negative effects, though there are positive effects. The strengthening of globalization leads to the inequality of development among countries, the sharp differences in the living standards of the population, the escalation of language, religion, traditions and, ultimately, the weakening of national state institutions. In this case, the protection and development of the state language is of great importance and special attention should be paid to this problem. At the end of the article, we came to the problem from another aspect, and we believe that if we use the right technologies properly and precisely, it can be achieved through the promotion of mother tongue. Our compatriots living abroad will be able to acquire new knowledge and will not forget and develop their mother tongue with effective use of remote training technologies. Millions of our compatriots living abroad will be able to benefit from these advantages. In order to achieve this, it is important to use the modern IT technologies' innovations as well as the effective use of language teaching methods for language development carried out by linguists. We believe that there is a relationship between these two factors, and when analyzing lifelong learning issues, there is a need for two aspects. At the end, it should be noted that we have to analyze the problem from different perspectives and make suggestions.

Keywords: Modern, Educational technology, Interest

Introduction

The deepening of globalization processes and the integration of countries can take up from three to five years. Information systems of the education system and meeting modern requirements are considered as one of the most important priorities of all states and international organizations. In this regard, it is considered appropriate to take into account the traditions of contemporary education in the world. The development of the distance education system that meets the requirements of the globalization process in the world is one of the most important aspects of the development concepts of the states and education policy. At least 4 new technologies are needed to adopt each new generation's labor activity. For this reason, experimental and theoretical knowledge needs constant renewal.

World experience shows that people tend to continually improve lifelong learning continuously (Life Long Learning). Due to the introduction of new technologies in the often changing world, there is a need for continuous education to adapt to these socio-economic conditions. Increasing the quality of part-time education in the country is one of the most urgent issues and it has been talked about regularly. It is known that time spent in part-time education is very limited. Even in many cases, every working student cannot find time for lessons. In the 2017-2018 academic year, the number of students in the bachelor's degree in Azerbaijan was 12,606. At the Azerbaijan State Economic University, the number of part-time students in the 2018-2019 academic year was 2115 people. Obviously, the number of part-time students studying in our country is quite enough. From this

perspective, the application of distance learning can help solve these problems. The highest number of students in the correspondence department is the Azerbaijan State Economic University, Baku State University and the Azerbaijan State Pedagogical University.

Employees apply for this kind of education to get education without leaving work. The negative side of this type of education can be summarized as follows:

- 1) The role of teachers in the part-time education and limited communication with them;
- 2) lack of academic hours;
- 3) limited scientific literature and so on.

These types of disadvantages in part-time education can be solved by providing up-to-date training to distance learning.

These days, education is a great business area in the world. Distant education is an important tool and technology of education in the international education market. Although distant education is profitable, such universities are owned and operated by the state. Distinguished by the fact that the educational form of the 21st century is the most promising, some experts have characterized this type of education as a political atmosphere.

The informatization of education system is considered to be one of the most important priorities of all states and international organizations. Therefore, it is expedient to take into consideration the modern educational traditions gained credibility in the world. The development of distant education system which meets the requirements of global processes taking place in the world is one of the important directions of the development conceptions and educational policy of states.

The development of distant education is the main direction of educational programs and it is defined as the priority in the item 126 of the Maastricht Treaty of the European Union. This direction is an important part of state policy in large states and international agencies, including our Republic. Therefore, it's possible to note the following Statutes and Decrees of the President of the Azerbaijan Republic:

- 1) A State Program on reforms in the higher education system of the Azerbaijan Republic in 2009-2013s;
- 2) "Azerbaijan 2020: Looking into the Future" Development Concept which had been submitted by the Decree dated December 29, 2012 of the President of the Azerbaijan Republic;
- 3) Action Plans of declaring 2013as "The Year of Information and Communication Technologies" in the Azerbaijan Republic.

In our opinion, the preparation of the theoretical - methodological bases and the investigation of development trends of distant education are very significant.

There is no common definition of distant education in the world today. The terms, such as "Distance Education", "Learning" and "Distance Learning" are mainly used in English speaking countries. The term Distant Education is mainly widespread in the countries of CIS. The word Learning means "to learn", i.e. to study independently in the Azerbaijan language. It expresses the meaning to study independently via either internet or various technical means "Distant Learning" and "Learning" are accepted as the forms of Distant Education for English-speaking authors. We want to take into your consideration that in the usage of the expression "open and distant learning" the word learning is used. Here we mean to learn without teachers and independently. The meaning of Distant Education is: to learn and to master higher education programs while making use of modern equipment's. We should note that teachers help to students to master specialists and professions in modern conditions. Therefore, Distant Education system is adult education and is a component of "Distant Learning" and "Distant Education".

According to some specialists, "Distant Learning" is the preparation of certain short-term training courses.

So, education is translated as – training, learning, reading and so on in some dictionaries. A Russian word «обучение» is accepted as to study in the form of distant education.

The basic principles of distant education:

In Distant Education, everyone can read at universities without losing time. Here, the student has the principle of free learning. The education is structured so that it can be separated from the teacher by time or distance, and they can communicate with the trainee, the teacher, and the telecommunications equipment at any time. Distant education in any area of education is possible. In Distant Education, teacher assignments, tests, and supplementary materials are sent to the student, and the student will perform all the tests and studies and send them to the teacher. Classes continue on this principle by the end of the semester.

Distant Education, which is widely used all over the world, is still not widely spread in our country. The reason for this is that people do not have education in this field, the lack of appropriate technical basis and jobs that meet the market conditions. In general, distant education has many advantages:

- So many parents do not risk sending their children away from them, or the family's financial ability to study abroad is insufficient.
- The ability to read and work
- Compared to visual education, it is a suitable payment
- Free education system
- Chance to pay with your credit card system
- Classes do not suit their own capabilities

Today education and its quality is very important. In fact, many young people in the country are unable to benefit from the right to education because of personal problems. Distant education system has advantages in this regard. At a time when technology is rapidly developing, distant education is also accessible and there is a necessity. This form of education can also be seen as support for formal education. Distant education is a new form of education for Azerbaijan. Experts believe that in order to implement distant education in the country, first of all, it is necessary to apply the world experience. In many foreign countries, there are special universities operating in such educational systems.

There is a fairly large history of this kind of education. About 1728, the concept of distant education has remained unchanged, but communication has changed. At that time, Kaleb Filips was the first organizer of distance learning, announcing "accounting and short-term correspondence courses" in Boston. The development of regular postal service has created a fertile ground for distant education. Thus, this communication, non-service remote communication connections was unstable and slow. The Philippines ad is in the following form:

"Knowledge levels of citizens who want to get these occupations will be the same as the level of students in Boston after receiving a few lessons".

The new stage of distant education has been linked to the active movement of the English language towards democratization in the world. In 1840-1890, Sir Isaac Pitman mailed the letter of delivery to the postal delivery price, that is, writing letters for short periods without profit. According to Sir Pitman, democratization of society depends on the ability of people to obtain higher education regardless of their political convictions or their social status.

Based on the experience of the International Correspondence School in 1890, the reason for the establishment of a distant education school in 1880 was to provide career demands for miner's immigrants. They wanted to be a brigade to avoid frost, but education was required.

About a million students have been registered for eighteen years as a result of powerful advertising. This was a great indicator for the industry and the country, given that the US population at that time was 75 million, but the results were unexpected. Thus, 83.4% of the students failed to pass through 1/3 of the course and only 2.3% were awarded the title of graduate. One of the ICS's managers wrote that they were freed from classes because they did not have self-motivation and practical knowledge. One hundred years ago, it became clear that distant education was self-educational and knowledge gained by individuals with a high culture. Radio and Television Education was the first prototype of "divested universities." New communications have led to new experiences in distant education. The development of the radio has led to the fact that students could sit at home and listen to lectures like in the university building. Clearly, issues and lectures are still being sent through paper, but radio broadcasts communication between student and teacher. The Pennsylvania State University was the first to broadcast its training on radio in 1922. But in 1934, the first television channel of the University of Iowa began to work. By the way, let's note that the channel continues to operate till today.

During the rapid development of technology, in the early 1970s, again, the universe of ideal higher education ideologies fired. In the US in the mid-1960s, new methods of distant learning emerged. The University of Experiments (UECU) sponsored by prestigious sponsors at Universities and Colleges that have implemented new techniques. In 1970, well-known universities were included in the community. For those years, the concept of Community Revolution (University without the University Building, abbr UWW) has been published in today's criteria:

1. There were no age restrictions for admission;
2. Students should be involved in the creation and improvement of the curriculum;
3. Maximize the self-study;
4. Adapt curriculum to course of study according to individual circumstances and needs of students;
5. It is important to involve experienced teachers in these or other areas;
6. Free access to UWW network in-house training materials;
7. Determination of new methods of assessment because of the lack of objectivity of the old evaluation methods (tests, attendance in lectures).

As you can see, this project can be regarded as a university, but a few universities have attempted to develop distant education and training programs. Unfortunately, during the twelve academic year, only a thousand students were able to earn a Bachelor's degree. However, there are many positive aspects of this project, since the age limit was removed from the universities and the opportunity to study at the age of 30 became the reason for the number of higher education graduates.

The British Open University, founded in 1969, has revolutionized innovation in distant education. "Open" means unrestricted access to education. Without regard to the level of knowledge, they were admitted to the university without the certificate of secondary education, but those who desired to read. Another indicator of openness was the distance from teaching, ie from countries, without leaving work. Most importantly, because the university is a state-owned, graduates receive a diploma (accredited).

In 1967, the British Minister of Education and Science instructed the University to prepare its work plan and charter. Firstly, it was necessary to study the demand and then to define functions and goals. The number of students from different classes is predicted.

The university was admitted to the age of 21 by the year 1986. Open University was called the second chance university. Designed for 18 year olds. There is no need to take any exams for admission to the university, and there is no need to certify that a secondary school is to be rescued. The main focus of the university was that it was a high-quality training material for intensifying short-term teaching. Open University is a supreme governing body. Students, representatives of the Ministry of Science and Education, the BBC and the royal

community are elected members of the council. The members of the Board are elected six times a year, solve the issues of personnel and financial issues. The Jones International University, established in the US in 1999, was the first state-accredited distant university. In addition, the university was established on the basis of television courses broadcast by 30 advanced universities.

The extensive education in the former Soviet Union is regarded as a form of distant education. For example, academician Kruglov believes that "distant education is similar to education in correspondence."

The form of correspondence education of the USSR is the first long-distant education prepared by the state. This experience has been used in the former socialist camp and has played a major role in training millions of specialists.

Distant education - correspondence education in the former USSR began to be formed in the 20s of the last century. In the 1926-1927 years, at the faculty of correspondence of Moscow State University, about 37,000 students were trained. At the beginning of the 1930s, correspondence education was widely used in all the leading universities of the USSR. The government was trying to raise the professional level of the workers and peasants. Students first came to the university to get acquainted with the course, after which they took textbooks and closely interacted with teachers to master them. At the end of the year, they returned to the university and exams.

Experience in the USSR shows that only educated and stubborn students were gaining prestige in teaching. Such deficiencies can be solved by providing modern equipment's by converting the correspondence education into distant education. The experience of developing countries, for example Turkey, Israel, India, Thailand, is of great interest to us. Thus, in Israel and Thailand there is a public open university (distant education). Universities offer undergraduate and graduate degrees.

The reason for the great success of higher education institutions in distant education should be sought in its paid education. For example, the budget of the Anatolia University of Turkey today is \$ 1 billion. close to USD. Although this university is a state university, it does not receive funds from the state. 400-500 thousand Turks living outside Turkey are studying there, and if they pay 1200-1500 euros, this year 600 mln. is equal to euro. Anadolu University's revenues in this area are aimed at the comprehensive development of education in the country. The University freely funded textbooks for first-graders. In general, distant education universities have a very rich budget that can be considered a kind of support for the country's economy.

Nowadays, education in the world is a great business area. Distant education is an important tool and technology of education in the international education market. Experts believe that by 2015, 80% of world universities will be educated on this technology. Although distant education is profitable, such universities are owned and operated by the state. Since the 21st century is the most promising educational form in the world, some experts also describe Distant Education as a political tool.

According to some studies, the drop in demand for formal courses has dropped since the last crisis in the world economy, but demand for Distant Education has increased. This is largely explained by the fact that the right to education in Distant Education is low, but consider that the demand for Distant Education is growing steadily over recent years. Thus, according to IDC's research, 1/3 of the European education market is based on Distant Education. In Turkey, 50% of the students are studying through Distant Education. 13-14% of students across the world study at distant Gandhi University in India. Corton Consulting estimates that the turnover of distant education will reach 50 billion by the end of this decade. However, according to the estimates of the United States National Institute of Standards and Technology, the US has already reached that amount.

(According to study by Ambient Insight, the growth rate of distant education in the CIS countries is more than 20%. This indicator is the record for the world.

Method

Method of the research:

analysis and synthesis, comparative, deduction and induction.

Findings

Application and development of distant education can help to solve the following problems:

- The development of distant education enables people from all over the country to get education, generally increasing the number and quality of people with higher education among the population and opens an opportunity to rise to the level of developed countries (Israel, India);
- After the launch of Azerbaijan's communication satellite into orbit, the quality of the Internet and communication system will increase. Therefore, Azerbaijanis who live abroad (in Russia, Georgia, Southern Azerbaijan, etc.), using the advantages, allows them to grow their education and profession without coming here;
- Structurally increases the country's industry power by addressing the problem of unemployment (by focusing on the necessary professions);
- Increasing the quality of part-time education to the level of full-time education;
- Can play an exceptional role in establishing a sustainable information society;
- It leads to the integration of Azerbaijani education and science into world science and education.
- Proper, efficient use of distance learning technologies will serve the development of our compatriots living abroad, at the same time not forgetting their mother tongue by getting new knowledge.

Results, Conclusions and Recommendations

The following results can be concluded from the distant learning form:

1. Open and distance education, eLearning, distance learning, distance education, and part-time education - these are synonyms and forms of distant education.
2. There is a need to make appropriate shift to the legislation for the development of distant education. The Distant Learning Experience of most countries points that government-driven management (UK, US, Israel, India, Philippines, etc.) is commercially viable.
3. In order to provide distant education, all universities are unwilling to acquire the appropriate material base. So, the experience of the United States shows that several universities may unite and use telecommunication equipments.
4. We consider necessary to organize the state's open distance learning university. It was the result of investigation for the development of distance education in our country, first and foremost, you need to make changes to the legislation. So the legislation requires a license for the application of distance education, but no licensing procedures have been established. We believe that on the basis of international experience it is necessary to prepare relevant rules in a short time.

Abstract

The purpose of the study is to substantiate the thesis on enhancing the role of the evaluative competence of academic personnel in the context of new tasks of universities in the light of the requirements of the knowledge economy. The statement about the need for continuous education of all participants and stakeholders of the educational process is generally accepted (European Forum - EFFECT, 2018; Little & Wolf, 1996). The analysis and conclusions are made on the basis of data from the author's survey of the professional motivation of developing skills for designing and using objective test knowledge gauges for students. The survey involved more than fifty subject teachers of economic and humanitarian profile of an economic university (UNEC). The analysis of the survey result allowed us to outline the optimal forms of systematic retraining and self-education of academic personnel for the development of professional, including appraisal, competence in order to improve the quality of education in a rapidly changing competitive educational environment.

Keywords: Academic staff, Assessment competence, Reflection, Self-development, Self-learning

Introduction

The modern world is changing dynamically, new technologies, discoveries are emerging, technology is being modernized. All this encourages a person to improve their knowledge and skills in order to keep up with the times. Today, lifelong learning is necessary for every teacher who wants to stay in demand, theoretically and practically prepared (Building a high-quality teaching profession, 2011). A knowledge-based economy is developing at a rapid pace, so people face some difficulties. In order to overcome them, a person needs to acquire new knowledge and skills. Educating people requires a broader diffusion of a new model of education and training — the concept of lifelong learning. Lifelong learning has the following characteristics (European Forum - EFFECT, 2018):

(1) in the center of learning - creativity, practice, analysis and synthesis of knowledge;(2) teachers direct students to sources of information; (3) in the process of learning follow individual plans; (4) teachers themselves learn throughout life, expanding their professional knowledge and skills; (5) training is carried out in the process of implementation of some activity; (6) learning takes place in groups and people learn from each other; (7) assessment of the results is carried out to develop further strategies and possible areas of study; (8) people have access to lifelong learning (Lifelong Learning in the Global Knowledge Economy, 2003). As can be seen from this list, all the conditions directly take place in the process of developing the competencies of university professors.

The study consisted of two stages: 1) identification of the development needs of the assessment competence and 2) assessment of the degree of mastery of the test technology after the course. In the process of training and research of participants of training, the role of assessment activity as a feedback of the pedagogical process and objective certification, as well as the value of test competence in a variety of promising forms of adult education are noted. Analysis of recent studies (Promotion of Teacher effectiveness. Annotated Bibliography, 2015) shows that the majority of university teachers use traditional systems of control and evaluation of students' learning activities, experiencing difficulties in developing, adapting to the educational process innovative assessment tools aimed at assessing students' individual achievements and developed professional competencies.

Object of study: the competent activities of a university teacher in teaching and assessing students' knowledge as the result of joint efforts.

Subject of research: (self) training of teachers for the development of evaluation competence in the educational process of the university.

The hypothesis of the research was made by the assumption that the proper preparation of the teacher for competent participation in the assessment activity will be successful if the necessity of constructing an incentive mechanism for the university teacher education focused on developing their methodological and evaluation competence is justified. Various similar approaches have been proposed in (Kellaghan & Greaney, 2001; Gallagher & al., 2011).

The solution of the tasks of the work led to the choice of research methodology: analysis of scientific, methodological literature and policy documents, observation during training, questioning, polling, ranking, data processing methods, modeling (Theory and Method in Higher Education Research, 2015).

Research concept

The main idea of our approach is that the development of the assessment competence of teachers creates an opportunity not only to improve the assessment tools and procedures in existing practice, but also to recognize and evaluate the suitability of new innovative technologies in relation to a specific educational environment. In the course of the study, one of the possible mechanisms is established with the feedback of development self-reflection based on the correlation with the student assessment of the pedagogical activity of the academic staff of the university. The author in his study relies on well-known classical and modern works on systems and processes of evaluation in higher education (McClarty & Gaertner, 2015; Hendrik & Yael, 2009; Morcke & al, 2013). In our opinion, assessment plays the role of the control and correction function of the educational process management system; therefore, the role of the competent participation of teachers in this process cannot be overestimated (Johnstone & Soares, 2014).

About competency and competence. According to the definition variant presented in the EEF Glossary of Terms (Glossary of Labor Market ..., 1997), competency is defined as: “the ability to do something well or effectively, compliance with the requirements for employment, the ability to perform special labor functions”. It also notes that “... the term competence is used in the same meanings. Competence is usually used in descriptive terms ”(ibid., P. 63).

At the start of the UNEC Summer School “Developing Competences of Teachers for the Development of Teaching and Certification Tools” held in May 2019, 52 school participants were interviewed at the start of the program. The purpose of this (first) survey was to establish the need and motivation for the development of methodological, including evaluation competencies, as well as to establish the potential for developing evaluation tools. As a field of development of competence assessment was chosen as a system for assessing the achievements of undergraduate students at UNEC on the basis of test tasks developed by subject teachers.

The problem of the need to develop professional competencies in the field of testing resulted from the growing gap between the updated content and training technologies, on the one hand, and the means of assessing students' achievements, on the other hand.

If progress has been observed in the renewal of curricula, basic and auxiliary teaching aids at UNEC, the sphere of development of the fund of evaluation funds may be somewhat behind the agenda.

The aim of the study is to substantiate the thesis on enhancing the role of the evaluation competence of teaching staff in the context of new tasks of universities in the light of the requirements of the knowledge economy. The statement about the need for continuous training of all participants and stakeholders of the educational process is generally accepted. The traditional model of retraining and advanced training of the faculty, due to its cost and inertia, in many respects does not meet the educational requirements of the knowledge economy.

Data analysis and preliminary conclusions are made on the basis of a survey of professional motivation for the development of training skills and the use of objective tests assessing student performance. More than fifty general professional and humanitarian teachers of the University of Economics (UNEC) took part in the survey. The study consisted of two stages: 1) identification of the development needs of the assessment competence and 2) assessment of the degree of mastering the testing technology after the course. In the process of training and research participants in training notes the role of assessment activities as a feedback of the pedagogical process and objective certification, as well as the value of test competence in various promising forms of adult education.

Analysis of the survey results allowed us to outline the most optimal forms of systematic retraining and self-education of teaching staff for the development of professional, including appraisal, competence in order to improve the quality of education in a rapidly changing competitive educational environment. In particular, on the basis of the identified sustainable preferences of the respondents, a network organization was proposed to develop the evaluation competencies of the academic staff, as well as the forms of motivation for preparing qualitative assessment tools.

Historically, evaluation in higher education has served several roles (Postlethwaite & Kellaghan, 2008): the motive and result of educational activities; monitoring or ensuring accountability in the educational system; professional selection; certification confirming the completion of a standard course of study; competitive selection for admission to the school; improving the quality of education by diagnosing its results, etc. Among them, the role of evaluation as a means of improving the quality of education, as well as a method of reflexive control, is of particular importance for university teachers. In this article, by the example of the competence of test assessment, only those means of evaluating students' educational achievements, which, because of their effectiveness in improving the quality of educational activities, are most often used in university practice, will be considered.

The development of the evaluation competence of the academic staff of universities in line with the requirements of continuing education is important for several reasons:

1. Assessment competence is interrelated with other professional competencies of university teachers: a lag in one area retards the development of other abilities and skills (Romiszowski, 1999);
2. Expansion of additional and distance education, various forms of self-study and self-development, puts forward the task of developing a modern fund of effective evaluation tools congruent to innovative educational technologies, including e-learning (Guasch & al, 2010);
3. Along with, instead of traditional forms of advanced training and retraining of teachers in the form of courses, schools, internships, innovative methods of self-development and self-education using the potential of information media are becoming more relevant and in demand (Minota, 2011; Bawane & Spector, 2009).

Second survey among the same participants was conducted at school closure in order to assess the effectiveness of the training program, as well as to identify the motivation and preferred forms of continuing to improve professional competence. Progress in the development of assessment competence was established using the question of an approximate growth of knowledge and skills in test technology, as well as comparing the correlation of advantages and disadvantages of test measurement of students' knowledge before and after the school program.

For the purpose of the study, the data obtained in the course of two surveys were supplemented with indicators of administrative data from the differential wage system for the same teachers, including student assessments of the success of educational activities. The goal of involving both rating indicators and students' opinions in the process of analyzing data was to try to illuminate the reflexive component of teachers' self-assessment by taking into account student participation in the formation of the average assessment of the indicator of the success of teachers' annual pedagogical work. Such feedback in the system of assessing the dynamics of competence and the annual scientific and pedagogical activity is proposed for the first time.

At universities of leading countries, evaluation competence in the system of requirements for teacher professional qualifications invariably plays an important role. Thus, in the system for determining the quality of higher education in Australia (Training and Assessment Qualifications and Competencies, 2018) in the section AQTF Essential Standards for Registration, Standard 1, Element 1.4. It is stated that people who have the competences of training and assessment given by the quality committee can teach at the university and if the teacher is obliged to carry out the assessment of students, he should have the following three competencies: (1) planning and organization of – niya; (2) competence assessment; (3) participate in the validation assessment.

A number of authors (Shadrikov, 2007; Isaeva, 2014) propose not only to classify the term “evaluation competence” as an element of pedagogical culture, but to single out a separate competence and include “knowledge of the functions of pedagogical assessment; knowledge of the types of pedagogical assessment; knowledge of what is to be assessed in teaching activities; proficiency in pedagogical assessment methods; the ability to demonstrate these methods with specific examples; the ability to move from pedagogical assessment to self-assessment”.

Our approach develops this interpretation, considering that the possession of objective assessment methods not only goes beyond methodological competence (Buiskool & al., 2010), but also involves the mastering of knowledge and skills of subject-oriented teachers's self-assessment of the current and final level of subject knowledge and skills (Gibbs & Coffey, 2004). It is in the case of full-fledged participation of teachers in such work that reflexive motivation of professional self-development can arise (Erault, 1995), when a teacher can not only quantify the final results of his efforts, but also make adjustments to the educational process based on the results of the assessment, as well as focus students on elimination of gaps in mastered knowledge and skills. Finally, possession of the evaluation competence, going beyond the pedagogical process, helps teachers to correctly navigate in innovative technologies of teaching and assessment (Guasch & al, 2010; Buiskool & al., 2010; Bawane & Spector, 2009)

An objective assessment tool widely used at Azerbaijan universities is a test method of knowledge assessment (SECRA, 2018). Many teachers have considerable experience in developing subject tests, however, there is a tendency to not participate in the assessment process, which leads to difficulties in timely updating the test task bank, even if the program content has been significantly updated.

The problem of the development of professional competence of university teachers is being actualized in the conditions of the rapid development of university education systems and technologies and the strengthening of the

role of teachers as one of the central figures of the educational process. In addition to expanding the composition and content of professional competencies of academic staff (Guasch & al, 2010), the need for continuous development of the system of competencies emerges. In this system, an important role is played by the teacher's assessment competence, which, in addition to being able to adequately assess the success of student learning, as a result of including teaching efforts, allows evaluative judgments to be held about the professional success and performance of teachers.

Thus, the improvement of the teacher's assessment competence as a tool for the self-assessment of professional competencies, acts as a means of diagnosing and regulating the flexible development of the necessary skills and skills in the context of dynamically changing demands and requirements for high-quality higher education. Note that even in the case where the teacher does not directly carry out the development of assessment tools (tests, case studies, essay, etc.), however, knowledge of the tools and technologies for assessing awareness allows to detect weaknesses in the training technology, and directional improvements to the entire training toolkit.

Note that some institutional forms of development of teaching competencies (such as advanced training institutions or summer schools) do not quite cope with the development objectives due to the inertia of the response to educational innovations (Buiskool & al., 2010).

To prevent a gap between the competencies required in the labor market and those formed in the learning process, it is necessary to build an information environment for assessing and developing the competences of teachers. The system of assessment and self-assessment of teachers' competencies should be built on the principle of a community of practitioners, for the interchange of experience and knowledge.

A number of authors (Desimone, 2009; Johnstone & Soares, 2014) believe that to improve the methodological approaches to the study of the development of teachers' professional competence and its impact on the effectiveness of student learning, as well as to establish the factors of reflexive self-development, it is necessary to conduct versatile multi-dimensional studies in which to maximize the extraction of useful information from both teachers and students. Generations of students change more often than generations of teachers, so teachers' self-development should, in a methodological and evaluative way, be ahead of the change in the typology of students' needs and expectations (Trigwell & al, 1999; Wyatt, 2011). In our situational survey, only a limited range of questions is put, aimed mainly at illustrating the possibilities and prospects of making more comprehensive research in the field of the formation and continuous development of professional competencies of the academic staff.

Method and data sources

Description of the data. 16 men (30.8%) and 36 women (69.2%) took part in the survey and analysis. According to the status of the main university employment, of the 52 respondents, 40.4% were ordinary teachers, 13.5% were heads of departments leading selective teaching, and finally, 46.2% were an initiative group of teachers who made up a group of volunteers of the movement for developing competencies and improving the quality of education. 69.2% of study participants have a doctorate degree, the remaining 30.8% have a master's degree or are applicants. The modal group consisted of mature teachers with work experience of 10 and 20 years (42.2%), the other two groups of 28.8% are young teachers with work experience up to 10 years and the older group with a teaching experience of over 20 years.

Indicator of the level of evaluation competence. The largest group of respondents (36.5%) has experience in developing tests for at least three academic subjects. A quarter of the surveyed (25%) accounted for tests in two subjects. 10 respondents (19.2%) made up only one subject in the previous period. The same number of respondents

previously did not participate in the development of tests. Despite the fact that the majority had experience in writing tests on the subjects taught, however, this work was carried out relatively long ago (8-10 years ago), and due to the lack of standards and guidelines, could not meet the classical requirements as testing theory (Crocker L. & Algina J. 2010), and the current industry test rules for measuring students' knowledge. The developed test kits did not pass the procedures of approbation and validation, therefore their compilers could not judge the effectiveness of the assessment of students' knowledge.

The main question and hypothesis

1. Question: How does the propensity for self-education of teachers in the process of lifelong education, along with other factors, depend on the level of development of their assessment competence?
2. Hypothesis 1: Status indicators and elements of competition in the form of more or less active participation in a differentiated wage system (DSS) affect the motivation for self-development and the development of new tools for assessing students' achievements.
3. Hypothesis 2. The reflection of one's own competence can be assessed using student assessments of teachers' professional qualities in relation to the objective indicators of the results of student learning success.

The source of data for the study was the following sets of information:

- a) a sample of administrative indicators for a differentiated wage system (DSS),
 - b) data from the survey of participants of the summer school "assessment of the need for the development of assessment tools" (May 2019)
2. The survey data (52 participants of the summer school - UNEC employees) were obtained in 2 stages:
- a) an initial study of the needs for the development of evaluation competence
 - b) assessment of the impact of training - measurement of the degree of growth of competencies.

Data sources & analysis

The SPSS data-base file contains 52 entries of 40 variable values related to:

- A) status;
- B) experience;
- C) development needs;
- D) preferences;
- E) returns (self-) learning;
- F) assessment of student performance;
- G) student's assessment of the teachers;
- H) teacher rating in the DSS - Differentiated Salary System.

Descriptive statistics and primary results

Samples of variables for the purposes of disclosing the proposed approach are indicated by s - First (start) survey, y - Second (final) survey, and x - Administrative DSS data, respectively.

Table 1. Descriptive data for categorical variables

Name and label of categorical variables	Values of variable	Column N %
	First (start) survey (n=52)	
s_0 gender	1 male	30.8%

	2 female	69.2%
s_1 Summer school status	2 academic	40.4%
	3 management	13.5%
	4 volunteer	46.2%
s_2 Teaching subjects profile	1 general	44.2%
	2 specialization	42.3%
	3 humanitarian	13.5%
s_3 Position	1 teacher	30.8%
	2 senior teacher	23.1%
	3 docent	46.2%
s_4 Scientific degree	1 master or candidate to doctor degree	30.8%
	2 PhD	69.2%
s_5 Pedagogical experience (<i>grouped</i>)	1 up to 10 years	28.8%
	2 10-19 years	42.3%
	3 20 years and more	28.8%
Second (final) survey (n=52)		
y5_1 5. How come your expectations from the summer school program?		
1. Preparation of syllabus	1 highly	67.3%
	2 moderately	15.4%
	3 in a low degree	7.7%
	4 no answer	9.6%
y5_2 2. Preparation of auxiliary means	1 highly	30.8%
	2 moderately	32.7%
	3 in a low degree	17.3%
	4 no answer	19.2%
y5_3 3. Preparation of tests	1 highly	63.5%
	2 moderately	28.8%
	3 in a low degree	3.8%
	4 no answer	3.8%
y5_4 4. The general benefits of the Summer School	1 highly	86.5%
	2 moderately	11.5%
	3 in a low degree	0.0%
	4 no answer	1.9%

Baseline data were tested for reliability and suitability for analysis. Estimates for this variable are obtained: Cronbach's Alpha is within acceptable limits (.293-.325 and .539-.595)

Table 2. Reliability analysis

Reliability Statistics			
	Cronbach's Alpha	Cronbach's Alpha	
		Based on	Standardized
Teaching subjects profile	Cronbach's Alpha	Items	N of Items
general	.293	.595	4
specialization	.324	.584	4
humanitarian	.325	.539	4

Table 3. Needs assessment

11. Which area would you like to expand your methodological experience?	Column N %
---	------------

<i>(multiple answers)</i>	
11.1. teaching materials	51.0%
11.2. testing and implementation of tests	25.5%
11.3. other measurement methods of knowledge	43.1%
11.4. another	39.2%

Approximately only one in four expected to expand the experience of drawing up and applying tests in the learning process, which indicates sufficient awareness, and judging by the answers to the next question about sufficient experience in test development (86% of respondents have been doing this in the last 5 years)

Table 4. Experience in preparation of teaching and methodical and evaluation materials

7. Preparation of teaching and methodical and evaluation materials in the last 5 years	Column N %
7.1. textbook, handbook, practical, scientific article	78.0%
7.2. syllabus, terminology, translation work	80.0%
7.3. methodical instructions, concepts and presentations	68.0%
7.4. tests (including their correction)	86.0%
7.5. exam questions, cases.	40.0%

At the end of the Summer School, most of the participants believed that their expectations were largely met and were surpassed, since many participants in the previous two such schools had the opportunity to compare the returns from participating in them.

From table 6 it is clear that with the possibility of choosing several answers to the question “Which terms of summer school?”, Teachers of humanitarian subjects, as well as those with work experience of 10-19 years, had more expectations. But the majority considered it more important (43.5 - 66.7%) to put the training materials in order first, and this is quite logical, since high-quality sources (programs, manuals, manuals and instructions) are needed to compile quality tests (63.5%).

Table 6. Expanding methodological experience across gender, subject profile and experience

11. Which terms of Summer school would you like to expand your methodological experience?	Gender		Teaching subjects profile			Pedagogical experience		
	male (%)	female (%)	general (%)	speciali- zation (%)	humani- tarian (%)	up to 10 years (%)	10-19 years (%)	20 years and more (%)
11.1. teaching materials	56.3%	48.6%	43.5%	54.5%	66.7%	53.3%	50.0%	50.0%
11.2. testing and implementation of tests	18.8%	28.6%	26.1%	13.6%	66.7%	20.0%	31.8%	21.4%
11.3. other measurement methods of knowledge	37.5%	45.7%	43.5%	45.5%	33.3%	66.7%	27.3%	42.9%
11.4. another (<i>expanding program</i>)*	31.3%	42.9%	43.5%	40.9%	16.7%	40.0%	40.9%	35.7%

* - author's comment: the proposal to include other issues in the summer school programs.

Table 6 presents a comparison of the expectations of related groups from the summer school program activities. Increased interest in the development of evaluation competence in the format of test and other measures of student learning is more pronounced among female teachers than male teachers, and among young teachers with 10 years of experience, there is some skepticism about the test technology compared to its alternatives (20 % versus 66.7%). In addition, there are significantly more expectations (every two of three) of the development of test competence among

humanities teachers than among general professional and special education teachers. The latter, in their answers, explain this by the laboriousness of mastering test technology and developing test kits in the absence of any incentives.

Table 7. Expectations across the gender, subject profile and experience

5. How come your expectations from the summer school program?	gender		Teaching subjects profile			Pedagogical experience		
	male	female	general	Speciali- zation	Humani- tarian	up to 10 years	10-19 years	20 years &more
	%	%	%	%	%	%	%	%
1. Preparation of syllabus	50.0%	75.0%	60.9%	72.7%	71.4%	53.3%	72.7%	73.3%
2. Preparation of auxiliary means	25.0%	33.3%	30.4%	31.8%	28.6%	26.7%	27.3%	40.0%
3. Preparation of tests	75.0%	58.3%	60.9%	68.2%	57.1%	66.7%	50.0%	80.0%
4. The general benefits of the Summer School	81.3%	88.9%	82.6%	90.9%	85.7%	86.7%	90.9%	80.0%

As can be seen from the table presented on average self-assessments of the growth of the level of test competence, on average, the highest increment of knowledge and mastered skills was observed in the technologies used in testing (55.9%). A noticeable increment is observed in other areas of the test technology (42-49%).

Students Success														.356*
17 indicator	.128	.078	.059	.001	.112	.062	-.082	.083	.153	.161	.111	-.038	*	

The student success indicator is significantly but weakly correlated with Analysis and evaluation of tests (%) at the level of 0.257 *. The indicator of relative activity of students (Share of student response) in evaluating their teachers also weakly correlates with the Annual academician score, apparently having a weak effect on the growth of the DSS rating of the teacher, who conducted training in this particular subject with this group of students. A stronger link (0.598 **) is found between the activity of students (Share of the student response) in the evaluation of their teachers, and the assessment itself (Students score (percent)) in percentage terms. This means that there is a tendency: the more students evaluate a teacher, the more high a grade is given by them. Thus, a higher assessment of the teacher is a reflection of the recognition of his professional competence, which is also expressed in more active participation in the assessment of the teacher. Note that the ratio of students is selective depending on the profile of the subject (correlation -.550 **). Thus, the average grade for teachers in general subjects (77.2) is slightly lower than the average marks for teachers of special and humanitarian subjects (81.76 and 82.32).

From the answers to the question number 7 "5 years?", It can be seen that the majority of survey participants have been active for the last 5 years in the development of teaching materials, but because of systematic and episodicity of this work, it had little effect on the quality and learning outcomes of students, as well as on the growth of the methodological and evaluation competence of UNEC teachers. Most likely, the development of competencies occurred due to the accumulation of teaching auditorial experience, rather than targeted training and retraining programs. Similar studies related to student reflection of teaching competence in various productions are reviewed in works (Mah & Ifenthaler, 2018; Leigh, 2010; Adel & Zitouni, 2017).

As can be seen from the correlation table between the student assessment and the teacher's annual total score in the DSS system, there is a noticeable dependence of the final grade on the average opinion of the students who have spoken about the teacher (note that students voluntarily rate the teacher anonymously through the student's individual office on the university's website before passing the subject of the teacher being evaluated).

At the same time, the relative activity of student groups does not affect the value of the final grade, but is significantly correlated with the teacher's average score (.598**).

Conclusion and Recommendations

The study substantiates the important regulatory role of the development of professional assessment competence of a university teacher in the context of continuing education. As follows from the analysis (Yarmohammadian, 2011), universities should include continuous professional development of the academic staff in their long-term strategies and consider pedagogical development as a systematic process with which academic staff interact throughout their careers.

In the course of the analysis and interpretation of the collected data, the main question of the research is a generally affirming answer that the propensity to educate teachers in the process of lifelong education is stimulated by the improvement of their professional, including evaluation competence.

Hypothesis 1 that status indicators (mainly position and length of service) and more active participation in the differentiated wage system (DSS) affect the motivation for self-development is confirmed in the preliminary approximation.

Hypothesis 2 on the reflection of the teacher's own competence through student assessments of his professional qualities in relation to the objective indicators of the results of student learning success is confirmed as a trend, but is not detected as a pattern, requiring additional research beyond the scope of this work.

Resume

1. In the conditions of the updated educational process of the university, the teacher must form a flexible assessment system, independently determining the functions and connections between the elements of this system (Postlethwaite & Kellaghan, 2008).
2. Evaluation activity is a mandatory component of individual teaching experience, covering methodological, purposeful, analytical and other aspects of the assessment process.
3. A teacher's training for competent participation in assessment activities can be effectively carried out within the framework of the university learning mechanism aimed at developing teachers' competence assessment.
4. Evaluative competence of the teacher is an element of his professional and pedagogical competence, including the value, cognitive, design, applied and reflexive components.
5. The role of evaluation activity as feedback to the pedagogical process and objective certification, as well as the value of test competence in various promising forms of adult education, are noted.
6. The survey results allowed to outline the optimal forms of systematic retraining and self-education of the teaching staff for the development of professional, including evaluation, competence.
7. In particular, based on the identified sustainable preferences of staff, the network organization was asked to develop teacher evaluation skills, as well as reflexive motivation forms for preparing evaluation tools.

Limitations and perspectives

The survey of a limited contingent of teachers, listeners of the Summer School, illustrates the approaches to the formulation of the research problem of the stimulating role of mastering the modern skills of educational assessment for the purposes of reflexive self-development of the academic staff. At the same time, the limitations of indicators and data does not allow for setting larger-scale multidimensional analysis tasks using, for example, DEA or BigData. The possibility of continuing the study on the contingent of more than 700 teachers with building models of the structure of the relationship of variables, analysis of hidden factors and forecasting is being considered.

Recommendations

1. Develop and adopt a standard test tools for assessing the competence of the teaching staff of the university.

2. To qualify the work on the development of testing tools as a scientific and methodological project and include it in the DSS system as an external incentive for the teacher's self-development in the field of assessment competence.
3. To recommend universities to stimulate the creation of specialized network communities with the unification of teachers from different universities for the continue exchange of the latest achievements in the field of assessment and development of evaluation competence.

The Problem of Forecasting in a Communicative Society

Leyla NAZIRZADA¹

¹*PhD in Philosophy Assoc. Prof. Azerbaijan State University of Economics, Faculty of Technology and Design,
Humanitarian Sciences Department
Email: leyla.nazir976@gmail.com*

Abstract

This article focuses on a topical issue in contemporary social research-forecasting. We examine in detail the specific features of the social projections (probabilistic, multivariate, different from the results of human activities, social programs, other social decisions), which update the problem of forecasting and modelling possible areas of societal development. We argue that the diversity of ways to develop the future requires the development of several possible options for the transition to a future state.

Keywords: Social forecasting, Communicative society, Risk society, Multivariate, Randomness

Introduction

One of the most important types of social research is forecasts that provide a piece of reliable information about the short or long-term future of a given social event. Forecasting is one of the most important functions of social science. The forecast is primarily to see the future or to inform in advance. According to P. Krishnamurthy (2010), forecasting helps to understand the factors that influence the future, their relation and results. In the course of our purposeful activity, we have always tried to understand the future. The emergence of an information society, the emergence of global challenges that threaten the existence of human beings has increased the interest of forecasting the future. This growing interest caused a real futurological explosion. Philosophers, sociologists, economists, historians try to understand the future in its whole range. For example, M. J. Cetron and A. Clayton (1975) found that it is possible to obtain information about the possible order of events, and as a result allow us the opportunity to influence these events to our benefit and minimize the disadvantages brought by them.

The social forecast is a distinct and, specific type of knowledge. The first specific aspect of the social project is that it has no real objective knowledge and is likely to carry a probabilistic characteristic. This feature of the forecast is explained by two reasons. Since the forecast is empirical knowledge, its accuracy is determined by the degree of conformity to real events and processes. Frederick E. Emery (1974) argues that the argument that future does not exist yet and cannot be experienced or known is a challenge for the forecasting of future, however, scientifically it is possible to make an accurate prediction to a certain degree by taking present conditions into account.

Coincidence, probability and irreversibility are the most important signs of the social process. Here, the role of spontaneous activism is also noticeable. From the history of human history, a great many examples can be drawn from the fact that chance at one stage or another stops the inevitable progress of the events, and correctly correlates with history as well. For example, no one thought that one day the USSR could collapse. Nevertheless, the USSR now is a part of the history, and most likely, will never return. For instance, Andrei Amalrik (1970) wrote that the Soviet regime is progressively getting so weaker that it is not certain how long it could be able to bear the strain.

We believe that our paper is beneficial for the literature as it introduces methodological pluralism in forecasting for better results in the forecasting process.

There are at least two important points that make social forecasting a challenge. Firstly, the dynamics inherent to modern society, in turn, complicate the forecasting process, because foreseeing everything beforehand is not always practically possible. Secondly, because any important event is the result of people's actions, desires, and willpower, sometimes the outcome of their actions does not coincide with their original intentions. Moreover, the unexpected social consequences of people's behaviour in modern times further aggravate the problem of prediction. The effectiveness of forecasts depends on many factors, including the fundamental principles of the research process. Thus, we have found the following basic provisions for the reliability of the forecast:

- The depth and objectivity of the analysis
- Having comprehensive information about specific conditions
- Operativity and competence
- *The depth and objectivity of the analysis*

The diversity of the ways in the future emerges requires the creation of forecasts in such a way that there are several possible options available for the transition between the options. To give more accurate predictions about the future, researchers are trying to give a few possible alternatives for the coming future. One of the most important tasks of social researchers is to reveal the causes and factors that determine the development of social events. Furthermore, the greater the number of factors influencing the incident, the greater the options for the forecast. According to M. J. Cetron and Audrey Clayton (1975), such examination enables us to recognize and assess the possible goal modification for the scheduling of goal achievement and helps to make a more comprehensive analysis of possible crises regarding the forecast to get more realistic future scenarios.

The basis of each version of the prognosis is the active influence of one or two social factors. However, the multivariate character of the forecast does not exclude those who compile the main version of the forecast and do not free them from having to prove on what grounds this decision has been made. Otherwise, scientific researches will produce such results that it will not be possible to determine how the end result of the forecast might be. Time will show which of the options will prove itself to be objective. However, it is also possible for real events to progress in a completely unexpected way and change the reliability of the forecast remarkably. Thus, the multivariate characteristic of the forecast is one of its specific features. The multivariate characteristic of the forecast does not always guarantee its reliability, meaning that, it does not ensure that the forecast is in complete agreement with real processes. Therefore, during the process of forecasting, possible errors should be predetermined and taken into account. J. Scott Armstrong (2001) argues that in the forecasting process, the information should be reliable and measurement error must be minimal. Due to the shortcomings in social sciences, the mathematical apparatus is not capable of fully reflecting all aspects of the forecast object's external environment. The method of expert evaluation is yet to compensate for the weakness of the mathematical apparatus in the construction of social models. Experts' assessments are a reliable basis for predictions on actual issues of society today. Most predictions in the economy, politics, and techniques are drawn up in this way. According to E. I. Kholostova (2007), "the expertise is to investigate the problem by formulating a specialist opinion, while the expert completes the information shortcomings with his knowledge and intuition." Furthermore, Safronova (2002) argues that, in the expert evaluations, the following methodological requirements should be followed: assessment of access status, identification of reasons for the disadvantage of the situation, identification of trends that are more specific to the situation, identification of the features of the most important components of the system.

- *Having comprehensive information about specific conditions*

Another feature of the social forecasting is that it is a special kind of scientific knowledge that differs from the outcome of people's activities, existing social programs and other social decisions. Indeed, the outcome of people's activities, existing social programs and other social decisions could also be considered as some sort of projection of the future. For instance, in projects and social programs, the points that are covered are in the stage of preparation, so they do not reflect reality. However, this does not translate those documents into a prognosis, as they represent the changes concerned with people, society and the government. One of the stages of this activity is the design of new objects, machines and mechanisms, and public events that are not yet known to practice. Dennis L. Meadows (1972) argues that our information about complex systems operate is incomplete, and several years need to pass before learning about its disadvantages.

- *Operativity and competence*

When designing social events, the understanding of the future is characterized by the fact that any decision before reality becomes available in the form of imaginary ideas. However, this is not the forecast, but the emergence of new elements of social existence. If the appropriate body accepts the projected event, it completes the process of creation of something new and makes appropriate changes in real practice. According to D. Bell (1960, 1973), the human impact on the environment is unstoppable; interdependence of people in different spheres of activity is also enhanced and the role of knowledge and information in social relations is increasing.

The situation in social forecasting is quite different. It is designed to see the future in advance and does not change anything in real life as any other scientific knowledge. Therefore, the projected event is not a forecast. The forecast predicts the possibility of its emergence.

It must be noted that not all the phenomena and processes investigated by social sciences can act as objects of the forecast. Because forecasting is interconnected with predicting the future changes beforehand, prognostic research can only include events and processes capable of developing as its object of the forecast.

Based on the above discussion, our arguments suggest that social forecasting is possible, and the reliability of this forecast is dependent

on three points which are the depth and objectivity of the analysis, having comprehensive information about specific conditions, and operativity and competence.

Method

The complexity of modern social processes necessitates the development of new predictive methods in social forecasting. As social forecasting is enriched with science such as anthropology, hermeneutics, axiology, praxeology, semiotics, synergetic, the problem of methodological pluralism is actualized.

As a solution to the stated problem, we used analytical, synthesis, comparison, exacerbation, historical and logical, historical parallels and other methods, which are general methods of cognition.

Findings

The findings obtained from this analysis can be summarized as follows:

- Social and humanitarian sciences cannot be closed by any universal method taken in terms of the constant stability of events. The social world must be investigated in its entirety. Therefore, it is the methodological

synthesis of the most diverse approaches (phenomenological, psychological, culturological, etc.) that define the direction of mainstream development of modern social cognitive methodology;

- The synergies of the methodological potential world and its scientific knowledge, the idea of the integrity of the universe, the evolution of universal self-organization mechanisms; the justification of the fact that the rule originated from chaos, its objective and universal nature of self-organization; suggests that development is the result of the instability that has had a constructive moment.
- The application of mathematical methods is one of the factors that increase the accuracy of modern social knowledge, as well as the cognitive-heuristic capabilities of social analysis. However, mathematical methods cannot be taken as an exact solution. First, they are not suitable for all occasions. Secondly, the application of mathematical methods in the analysis of complicated social systems can be accompanied by serious errors. Planning, projection, forecasting are the attributes of modern society.

Results, Conclusions and Recommendation

This paper documents evidence regarding the problem of forecasting a communicative society. Our findings show that forecasting is possible and reliable. For it to be reliable, three points must be met. Those points are the depth and objectivity of the analysis, having comprehensive information about specific conditions, and operativity and competence of forecast.

Changes in the world today are mostly scientific-technical. Therefore, philosophical theories, which are supposed to predict the future of humanity, must rely on the predictability of technical progress. For further researches, we recommend experts to critically analyze traditional, but largely outdated values for scientific and technological progress and social progress, for technogenic civilization.

Priority Directions of Financing Socio-Economic Development of Regions in Azerbaijan

Nusret BABAYEV

*PhD.Candidate ,Azerbaijan State Economic University,
Email: nusret.babayev@gmail.com*

Abstract

The article outlines the essence of the state's regional policy and determines its main directions. Specifically, the criteria for determining the backward regions, which are of crucial importance in the formation of the regional policy of the state, have been substantiated. The article also substantiates the directions of financing the social and economic development of the regions. These justifications cover energy, transport and social development issues. The article outlines the factors that necessitate the state support to the development of the rural areas. The density of the population was noted as the main factor supporting the development of rural areas. Thus, in rural areas, due to low population density, both production and sales of products require large expenditures in comparison with urban areas.

Keywords: Regional policy, Spatial inequalities, Financing rural development, State programs

Introduction

Provision of regional development at the present stage of Azerbaijan's economic development is one of the most important priorities. Development of all regions of the country leads to overall development and increase of living standards of the population. Regional development policy is aimed at ensuring economic growth and sustainability of economic development. Based on the detection and elimination of structural problems in the country, state policy focuses on forming the necessary conditions for the development of regions and raising their competitiveness. The state's regional development policy, direct and indirect coordination of long-term economic decisions in order to address the challenges posed by regional development, in some cases, income, consumption, employment, investment and so on in regions can be seen as the conscious attempts of the state directed to control over the parameters. This policy is, first of all, related to the amount of public spending on the objectives of eliminating the differences between the regions on the development of regions and the level of socio-economic development. Thus, reaching any of the goals depends on decisions about the distribution of limited economic resources. This applies directly to one of the functions of finance. Second, regional development policy covers the impact of economic agents' decisions on the location of production and investment activities. So, the activity of any subject is related to the location. From this viewpoint, the state will have the opportunity to influence the selection of such a space. By influencing the formation of income of farmers, the state affects their decisions regarding the location of production

Method

The method of the research is based on a technical-economic analysis of the statistical data on local and regional progress and material well-being in Azerbaijan. The article uses an application-oriented approach to define areas of financing for regions.

Socio-economic development of regions in Azerbaijan

Space is an integral part of economic, social, ecological, political and cultural attitudes and processes, and their geographies define the conditions and forms of societal methods of how these processes can be developed (Markusen A. (1987) Regions: The Economics and Politics of Territory, Rowman and Allenheld, Totowa, NJ.). The unevenness or differentiation of the economic space has a significant impact on the state structure, the structure and efficiency of the economy, the intuitional changes and the tactics of socio-economic policy (p.41) (Regional development: the experience of Russia and the European Union. / A.G. Granberg, Moscow: ZAO "Izd-vo" Economics ", 2000, 435p.). Local and regional progress and material well-being depend on the continued growth of employment, income and productivity, which is an integral part of economic development

(STORPER M. (1997) *The Regional World. Territorial Development in a Global Economy*. Guilford, London.). From this point of view, the concept of "regional development" is related to the change in the number of population, employment, income and value-added regional productivity. It also means social development, which includes the health and well-being of the community, the quality and creativity of the environment (*Theories of Local Economic Development: Perspectives from Across the Disciplines/Edited by Richard D. Bingham and Robert Meir*. London: Sage Publications, pp. 319. C.27). In our view, the socio-economic development of the country is related to the socio-economic development of the regions and the elimination of differences between them. Regional development depends on geographical and demographic factors, specialization and productivity, physical and human capital, infrastructure and innovation. As the factors on the regions differ, their developmental levels also differ. This situation is widespread even in developed countries. For example, in Belgium the gross domestic product (GDP) per capita in the capital is 2 times more than in the province of Flanders, 2.8 times than in the province of Wallonia, and in the Netherlands this indicator in Antwerp is 1.8 times higher than the province of Eno (*Regional policy of the EU countries. IMEMO RAS, Moscow: 2009, 230 p. from. 14.*). Studies carried out in 1995-2007 by member states of the Organization for Economic Cooperation and Development (OECD) have shown that 32 percent of economic growth has been achieved by about 4 percent of the regions. The emergence of such a situation affects the geographical position of certain regions, their natural vulnerability levels, climates, and the quality of land, but in many cases market forces deepen regional inequality.

The main purpose of the regional economic (or socio-economic) policy is to express the compromise between economic efficiency and social justice, although it is expressed in different ways in different countries (A.G.Granberg. *Bases of regional economy*. Moscow: State University Higher School of Economics, 2003, 495 pp., P. 350). For example, in most OIC member countries, regional equilibrium (justice) and efficiency (growth and competitiveness) are based on regional policies. Examples of regional balances include the priority of the development of the backward regions in Denmark, the regional balance in Finland, the territorial integrity of France, and the equal living conditions in Norway (pp. 14) (*Regional Development Policies in OECD Countries*. Paris:OECD Publishing, 2010, 388 p.). The scale of the development of the regions has a significant impact. It is assumed that the rural area has a higher position in the distribution of economic resources than cities. In such a situation, the development of infrastructure for improving the competitiveness of vulnerable regions can be ensured by the allocation of economic resources to the benefit of vulnerable regions due to the state's funding. Thus, the region's competitiveness has a significant impact on the speed and value of material, financial and information flows in that region.

Results, Conclusions and Recommendations

According to the socio-economic development of the forces, the role of the market in reducing regional inequalities is limited and this usually causes concentration of production in separate regions. Therefore, the state implements the redistribution of economic resources in favor of the regions with low development levels to reduce disproportions in the territorial structure of the national economy. In such circumstances, it is necessary to determine the criteria for the implementation of the resource allocation. For example, in the European Union, these criteria are the gross domestic product per capita, the unemployment rate and the rate of job creation, rural and agrarian regions (9. A. Cappelen, F. Castellacci, J. Fagerberg, B. Verspagen. *The Impact of Regional Support on Growth and Convergence in the European Union*. Eindhoven Centre for Innovation Studies, The Netherlands Working Paper 02.14, September 2002, 27 pp, p. 7.). Thus, in the European Union, if the per capita Gross Domestic Product in the region is 75% of the average, this region is considered to be the backward. Also, the gross domestic product per capita and the share of agriculture in employment is one of the factors that are considered in determining the state support to the regions. From this point of view, it is possible to identify the regions in Azerbaijan that need to be supported. Although the gross domestic product is not calculated in the regions, the gross output per capita on key areas in the regions in 2012 varied from 5.1 per cent to 39.1 per cent of the country's average (Except for the Nakhchivan economic region, this figure is 95.8 percent in this region). As you can see from this criterion, all regions (except for the city of Baku only) are included in the category of

regions that must be supported. Also, in 2012, 37.7 percent of the employed population accounted for agriculture, forestry and fishing, which is mainly covering the regions. In this regard, supporting the development of agriculture in the regions, as well as the development of non-agrarian spheres should be prioritized.

At present, the Azerbaijani government has the necessary capacities to finance the development of the regions. Successful implementation of oil strategy has increased the volume of revenues in the country. An important part of these revenues remains at the disposal of the state. So in 2011, 50.1 percent of the remaining revenues in the country were aimed at saving and only 42.4 per cent of these resources were directed towards implementing investments across the country.

Also, 62.0 percent of total savings in the country in 2011 were at the disposal of the state, of which only 44.3 percent were used. Over the recent years, the state's overfulfilment of the consolidated budget revenues has led to an increase in the assets of the State Oil Fund of Azerbaijan. Thus, the resources of this fund will be \$ 34.1 billion USD by the end of 2012, which is approximately half of the gross domestic product.

Limitations of financial opportunities in the regions of Azerbaijan and poor development of institutional structures significantly increases the role of the state in regional development. Despite the implementation of two regional development programs in the country over the past 10 years: State Program on Socio-Economic Development of the Republic of Azerbaijan (2004-2008) and State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan in 2009-2013, the difference between Baku and other regions has not diminished significantly. Taking this into account, the Government of Azerbaijan has adopted the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018. In our view, the precise definition of regional development programs is crucial in terms of the effectiveness of the limited economic resources distribution. These goals are different in different countries. For example, the goal of a regional policy in the UK is to achieve a high and stable level of economic growth and employment across the country by providing full use of the existing potential of each region. In Poland, regional policies are aimed at supporting economic growth pole (large cities), in addition to stimulating the development of the backward regions, especially southern regions. In general, in the European Union, regional programs covering 2007-2013 include goals such as mergers, competitiveness, employment and foreign co-operation (Governing Regional Development Policy: The use of performance indicators. Paris: OECD Publishing, 2007, 198 p, p.34.). From this point of view, it is important to identify the objectives of regional development programs. The main objective of the "State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018" is the continuation of measures to develop non-oil sector, diversification of the economy, rapid development of regions, especially infrastructure and social services as well as further improvements. In our opinion, the main goal here is to accelerate the rapid development of the regions (including the development of the non-oil sector and the diversification of the economy). Nevertheless, the mentioned program would provide a high tempo of economic growth by identifying development poles in the country and directing resources to the development of these poles.

To achieve the goal set out in the "State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018", it is intended to achieve further improvement of the provision of infrastructure in the regions, including the provision of communal services to the population, accelerating the development of entrepreneurship in the direction of export-oriented and competitive products, increasing the employment rate of the population, especially the rural population, and the continuation of measures to reduce the poverty level.

One of the most important tasks facing the government is to increase employment in the regions. Thus, by the end of 2012, the population in the country increased by 33.2 per cent compared to 1989 and 17.6 per cent in comparison to 1999, while the number of able-bodied population increased by 66.5 per cent and 43.4 per cent respectively. As a result, the share of those who are able to work in the total number of the population increased from 55.4 percent in 1989 to 56.8 percent in 1999, and to 69.2 percent in 2012. It should be noted that this figure reached its peak, 69.3 percent in 2011. As you can see, at present, the country has entered into the most aggressive period in terms of employment. In 2012, the share of Baku in the country's population was 23.0

percent, while its share in hired workers was 44.7 percent. Also, the latter figure increased by 1.8 percent compared to 2000. In 2012, the share of hired workers in the total number of the population was 30.7 percent in Baku, whereas in economically distant regions this figure was 11.4 percent. In particular, the rate of natural increase in rural areas in the country being relatively high, increases the importance of rural development and employment promotion. For this purpose, the following measures are envisaged in the field of employment in the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018:

- expansion of regional economic relations;
- Formation and development of a fair competition environment, ensuring compliance with labor legislation;
- directing a portion of revenues from oil exports to human capital development and applying advanced technology and innovations to the development of science-intensive industries;
- Creating a balance between the proposed workforce and the number of jobs available;
- Reduction of population migration through further development of social and communal infrastructure in rural areas;
- Increasing the level of employment of women and youth.

In general, the creation of new jobs in the country is one of the key factors that determine the economic policy of the state and it will depend on the measures taken to improve the competitiveness of the regions. One of the main directions of raising competitiveness of the regions is related to the development of infrastructure.

One of the important areas in the development of the regions is the development of transport. Investments in transport infrastructure increase the region's internal and regional ties with other regions. This leads to the improvement of conditions for production, tourism and commerce, as well as the increase in competition and concentration across the country by reducing the time of transportation as well as the quality and price ratio of transportation services. The development of transport infrastructure in the country is also a necessary condition for the specialization of regions.

It should be noted that the development of transport infrastructure has a direct, indirect, and derivative influence on the development of employment in the regions. Direct and indirect impacts are related to the creation and operation of transport infrastructure, whereas indirect impacts result from the impact of transport infrastructure on the region's competitiveness. As a result of the development of transport infrastructure, the time and cost savings, increased access to transport services, and reliability increase productivity in production. For example, the increase in the quality of motor roads can increase the vehicle lifetime and reduce its current operating costs. Also, increasing access to markets leads to increased productivity by creating new opportunities for business and raising competition. Thus, the development of transport infrastructure has a significant impact on employment and economic growth by increasing labor productivity.

The energy supply is crucial in the formation of competitiveness of the regions. Expansion of the electricity grid causes a reduction in system costs associated with investment projects in the regions. Over the past 2004-2013, 17 power plants with a total capacity of 2000 megawatt have been built in the regions, more than 10,000 kilometers of power lines and more than 1,500 substations have been constructed or reconstructed. During the mentioned period, 40,000 kilometers of gas lines were constructed or repaired in the field of natural gas supply, and the level of gas supply in residential houses reached 83.4 percent from 34 percent. At the same time, economic growth in the regions may require additional energy resources.

One of the key priorities in the development of the regions is the financing of housing and communal services. So, in most regions of Azerbaijan, in housing and utilities sector, the current level is significantly below the established norms. For example, in 2012 the average per capita housing area in Azerbaijan was 13.1 m², whereas in Sweden this indicator was 52 m², in the UK 34.5 m² and in the US 96 m². Also, the proportion of housing commissioned in the country in 2012 was about 1.9 times less than in 1990. Also, if we accept the amortization period of a residential building for 50 years, then we come to a conclusion that the depreciable part of the country's housing stock is more than 2141.2 thousand square meters of housing put into use in 2012. As it is evident, increasing the housing construction is needed to improve the living conditions of the population in the

country. Also, according to a survey conducted by the State Statistical Committee in 2010, an average household in the country consumed 2966.7 kWh of electricity in 2009. This figure was less by 907.6 kWh in Nagorno-Shirvan economic region, 772.4 kWh in Guba-Khachmaz economic region, 1040.8 kWh in Sheki-Zagatala economic region, 505.8 kWh in Ganja-Gazakh economic region, 412 kWh in Nakhchivan economic region and 756.8 kWh in Lankaran economic region. In the mentioned year, the average gas consumption per household was 2143.0 cubic meters, which was less by 619.9 cubic meters in the Nakhchivan economic region, 68.0 cubic meters in the Ganja-Kazakh economic region and 426.7 cubic meters in the Lankaran economic region m, and 345.2 cubic m in the Aran economic region. In 2012, 54.8 percent of households lived in urban areas, 45.2 percent in rural areas, while households with central heating systems account for 12.8 percent, households with network gas - 75.2 percent, the water pipe share of households was 78.8%. Also, one of the priorities is the implementation of measures to improve the population's housing coverage in conditions of population growth. In this area, the continuation of reforms in the housing and communal sector in the regions, supporting the development of the real estate market, provision of low-income citizens in need of housing in the regions, including young families, reconstruction and improvement of the water supply and sewerage system measures are planned to be implemented in 2014-2018. For example, within the project "Reconstruction of water supply and sewerage system of Lankaran city", it is planned to build ultrasonic cleaning plant based on a new technology with the output of 30,000 cubic meters per day. The project envisages construction of 15,000 cubic meters of water reservoir, pumping station, 200 km of various diameter distribution network, 180 km long sewerage network and 8 sewage pumping stations.

In recent years, large-scale investments have been made in education in the regions, but this sector still remains a priority. In particular, the coverage of regions with pre-school institutions is low. For instance, in the Lankaran economic region, the level of provision for kindergartens is 15 per cent, in Nagorno-Shirvan economic region - 8.2 per cent and it is 23 per cent in Sheki-Zagatala economic region.

Also, the calculations show that the number of seats in the regions is smaller than the numbers specified in the standard (AzDTN 2.6-1). From this point of view financing of construction of cultural facilities is one of the priority areas.

It should be noted that, in addition to investment costs in the aforementioned areas, a substantial part of maintenance costs should be provided through the state budget. From this viewpoint, it is required to link the revenues of state budget with increasing costs.

In 2012, 60.9 percent of the population in the economic regions of Azerbaijan (excluding Baku) was made up of rural population. In this regard, the social well-being of a significant part of the population depends on the development of rural areas. As already mentioned, geographically, economic growth is mainly based on scalability and concentration in certain regions and cities. That is, the regions that can not mobilize enough opportunities to obtain employment and income are left behind. From this point of view, rural areas have a number of shortcomings. Thus, rural areas do not have a density which has a positive impact on the growth of the economy in a certain space. For example, according to the definition of the Organization for Economic Co-operation and Development (OECD), if less than 150 people fall per square meter, then such communities are considered as rural communities.

If the share of the rural population exceeds 50 per cent in the region, then such region is mostly considered rural, if this share is less than 15 per cent then it is considered an urban region, and finally if it is between 15 and 50 percent, then such region is considered to be a middle-sized region...(OECD Rural Policy Reviews: Germany. Paris: OECD Publishing, 2007, 200 p, p.31.) In general, the American economist J.Makal has included the following factors limiting the development of rural areas (Magill, John (2003), "Rural Economic Development" in Sammis B. White, Richard D. Bingham and Edward W. Hill (eds.), Financing Economic Development in the 21st Century, M.E. Sharpe, Inc., New York, pp. 266-276.):

- Great distance to markets;
- Individual meetings of people living in rural areas (these meetings differ in comparison with towns);
- Limited access to capital (low competition among the rural lenders causes the capital price to be high);
- Limited scalability capabilities;

- Limited network of entrepreneurs;
- Deficiencies in information and business services;
- Restrictions on the relationships of rural economies with the rest of the economy;
- Lack of qualified personnel.

The above mentioned bring the state promotion of rural development to the fore. Also, agriculture is a key element of rural livelihood and is closely linked to other economic, environmental and social development forces in these regions. From this point of view, the development of agriculture affects the well-being of the rural population. In 2012, 37.7 percent of the employed population accounted for agricultural, fishing and forestry, whereas those employed were 38.4 percent of those living in rural areas. Also, about 59.1 percent of the working-age population living in rural areas operated in this area. In 2012, the economically active population in the country was 50.4 percent of the total population. Given these figures, estimates show that around 76 percent of the economically active population in rural areas are involved in agriculture, fishing and forestry. It should be noted that in the countries included in the Organization for Economic Cooperation and Development, only 10% of existing labor resources in rural areas are engaged in agriculture and forestry, and their support is needed (The New Rural Paradigm: Policies and Governance. Paris: OECD Publishing, 2006, 168 p, p.13.). At the same time, income per capita in agriculture is typically lower than in other sectors of the economy. So in 2012, an average of about 135 AZN added value was created per month for a person engaged in agriculture, fishing, and forestry, then we come to the conclusion that in rural areas income from employment is relatively small. From this point of view, the state is required to support rural areas as well as agriculture.

The measures to support the development of the agricultural sector are multilateral. Thus, the development of the agricultural sector affects food security, raw material supply, and ecological status. Thus, in 2012, 55.1% of the country's land was used for agricultural purposes, and 29.9% of these land areas were irrigated lands. From this point of view, agriculture has the potential to reduce land quality and to seriously affect water pollution. In such circumstances, policies for agricultural development should include environmental protection and biodiversity conservation. Also, since rural areas are at a distance from major markets, due to the low concentration in these places, infrastructure density and development levels are low, thus causing additional costs comparing to urban areas. Therefore, it is necessary to provide a state support to the development of rural areas, especially the agricultural sector.

A modern approach to rural development envisages the implementation of large-scale investment projects, along with granting subsidies to the development of regions dominated by agriculture. These investments are made in order to create favorable conditions for living in the regions and to increase their competitiveness. This is related to the provision of necessary production and social infrastructure to rural areas. Also, the competitiveness of the agricultural sector depends largely on the development of the fields serving this area and staffing. In this regard, establishment of warehouses in the regions, agro-services serving agriculture, improving the quality of veterinary and phytosanitary services, seeds, fertilizers and pesticides, development of necessary sales channels, such as the organization of information and communication services for agricultural producers, are factors that determine the competitiveness of the agricultural sector.

Development of agricultural products processing industry in regional centers and rural areas plays an important role in the provision of developing rural areas. There are great opportunities for the development of the food industry in the republic. Thus, in 2012, the volume of production of food products, including beverages, amounted to about 25 percent of the 1990 level and this decline was mainly due to a decrease in the production of export-oriented food products. Also, the complex processing of raw materials in the food industry is of crucial importance. Thus, in the processing of agricultural raw materials, products and production waste are also obtained along with the main product. For example, except for meat products, the waste of cut animals - hair, nails, horns, bones, gut, blood, etc. are also obtained in meat production. These waste products are used in various types of products (combinations, buttons, brushes, musical instruments etc.) and more than 40 medicines, animal feeds and so on. can be produced by using these wastes. The absence of waste recycling facilities reduces the efficiency of production. Therefore, the complex development programs for separate areas of food products

should be developed in the republic, and this program should take into account the processing stages of agricultural raw materials.

In general, the development of small and medium-sized businesses on the basis of administrative district centers is crucial for the creation of developmental poles in the country. Meanwhile, the specialization of agricultural products in separate regions, the creation of specialized warehouses, transportation economies and processing facilities can play an important role in the development of the regions.

Along with the food industry, there are available opportunities for the development of light industry, mechanical engineering and metallurgy industry, building materials industry in the regions. It should be noted that the development of local raw materials based on the "State Program on socio-economic development of the regions of the Republic of Azerbaijan in 2014-2018" has been identified as a priority in this area. Nevertheless, it would be expedient to further define industry development opportunities within the framework of the mentioned program. In our view, it is required to conduct research in the following areas to identify industry development trends:

- available natural resources and their estimated quantities in the country;
- structure and volume of agricultural production;
- volume of future demand for certain consumer products;
- volume of import;
- successfully developing industries in countries with similar volume and structure of existing financial, labor and natural resources;
- possible interaction of the existing fields in the country with local and foreign related areas;
- opportunities for development based on vertical or horizontal integration of existing production;
- possible diversification of existing production;
- capacity to increase production volumes due to the scale of production.

It should be noted that there are limited opportunities for the development of many areas of industry at the expense of only domestic market. Only industrial products that are oriented to the domestic market ultimately lose capacity to scale-up and are not competitive in the long term. Therefore, it is possible to develop the country's industrial potential by creating relatively large industrial companies. At present, the creation of such industrial companies in the country is mainly possible with state participation and financial support. In such circumstances, certain actions can be taken in specializing in certain industries of separate regions in the country. In recent years, the black and non-ferrous metallurgy industry in the country has been primarily developed in the Ganja-Gazakh economic region. In our opinion, while the areas of food and light industries are mainly developed in line with their specialized agricultural products in the regions, it is advisable to develop industrial production based on raw materials and employment factors.

The role of staff in achieving success in the above-mentioned direction is crucial. Therefore, the training of staff and raising their knowledge and skills in the country should be one of the main directions of government policy. In recent years, state funding of education in foreign countries, the development of vocational education and etc. steps are among the measures taken in this direction. Nevertheless, the development of separate regions should be clearly defined and the training of personnel in these areas should be financed.

Thus, direct and indirect financial support of the state is required in these areas. Determination of the role of the state in the financing of socio-economic development of the regions is also made based on the evaluation of the opportunity to participate in this development of the private sector. Thus, regional policy in Azerbaijan is aimed at raising competitiveness in the regions, creating new jobs and increasing social security. Measures in this direction cover both economic and social and environmental issues. Since 2004, regional development programs in Azerbaijan have led to an increase in the overall level of development of the regions, but did not substantially reduce the difference between Baku and other regions due to the level of income. Meanwhile, five-year regional development programs implemented since 2004 have played a crucial role in mobilizing financial resources and promoting regional development.

Abstract

The school culture can feel as soon as you enter the school building and it is a place where you can learn more as long as you observe the students, teacher and other staff. We can get many information about the culture of the school from the physical structure of school, its orders, panels, the relationships between teachers and students and also from their face mimics. In this research, it will be answered that how the school culture affects the teacher's behaviours. Datas were gathered from 164 teachers who worked in the schools at Başiskele district in 2017-2018 and who were chosen by volunteering basis. The survey tool composes of 2 parts; 'Personal Information Form' and 'Teacher Behaviors Scale'. To evaluate the datas, one way Anova and T-test had been used. In research, as the existing situation will be described, the descriptive survey model had been used. When the whole datas were considered, it was seen that the positive situations about the school culture affects the teachers' behaviors positively in general, and the teachers are motivated or they work more actively, the negative situations decrease the motivation of many teachers. It causes to have stress or teachers try to change this situation.

Keywords: Culture, School culture, Organization, Teacher, Behavior

Introduction

The word "organization in English, which is based on the Greek word organon, is used in Turkish as the word "örgüt" (Arpağuş,2011). According to Başaran (2000), each management theory defines the organization from its own point of view. Therefore, the organization has at least as many definitions as the number of theories. According to the theories of structural and process management, the organization is the formal association of people who have come together to realize the determined goals. As stated in behavioural management theories, the organization is a fabric of the interaction process created by people in order to reach their shared goals. In system theories, the organization is a partnership of the working and the clusters who are committed to the goals they develop through agreement.

In 1871, the first definition of culture was expressed by the anthropologist Taylor as “a complex whole of knowledge, belief, art, morality, tradition, and many other talents and habits of people living in a society” (Temiz, 2009). Culture is a variety of attitudes, behaviours and beliefs that determine the perspectives of people who are shared, developed and passed on from generation to generation (Kongar, 1989). Organizational culture allows people in the organization to meet on a common ground.

Schein (1991) defines the culture of a group as: “A pattern of shared basic assumptions that the group learned as it solved its problems of external and internal integration that has worked well enough to be considered valid and, therefore, to be taught to new members as the correct way to perceive, think, and feel in relation to those problems. Tylor (1970) defined culture in very different terms: “Culture or civilization, taken in its wide ethnographic sense, is that complex whole which includes knowledge, belief, art, morals, law, custom, and any other capabilities and habits acquired by man as a member of society.”

In many sources (Başaran, 2000; Bursalıoğlu, 2008; Üçok, 1993; İra, 2004; Schein, 1991; Kaya, 2008), the concept of organization defined in different ways can be described as a social open system formed by individuals who came together to realize certain goals. Individuals who make up organizations can have different purposes. The purpose of people coming together in organizations should be to meet the common goal. This common goal creates the culture of the organization. Culture is the main factor that enables administrators and teachers to act jointly in the school environment.

Values and norms, one of the main elements of culture, provides the school staff to act jointly. The first resistance to change in school comes from school culture. Since the change brings about some unknown things, people react to this uncertainty. Because change not only creates differences in the existing structure, but also in processes and relationships. As in all organizations, change is inevitable in educational organizations. But resistance to change is also a fact. If the organizational culture that affects the behaviors of administrators, teachers and students in educational organizations is supportive of change, less resistance can be encountered (Çelik, 2009).

Fullan (1991) and Hargreaves (1997) make reference to four types of school culture: In the first type of school culture, the teacher is the ruler of his or her class and this creates a competitive atmosphere in the classroom. In this type of culture, teachers focus on the present and perform traditional practices instead of long-term subjects and studies. The second type is a culture in which limited cooperation is preferred and cooperation is weak and superficial in these cultures. Teachers share materials and some teaching strategies; however, they refrain from discussing deeper topics such as curriculum, long-term planning or their own educational philosophies. Third, it is a type of school culture in which fake co-operation, open bureaucratic policies and procedures, formal structures stand out and cooperation culture is not supported. The fourth is a type of culture where cooperation culture is emphasized continuously and teachers are in a development and confidence that their professional competence increases over time. Team teaching, consulting and shared decision-making practices are very important in collaboration cultures. Teachers are pleased with their continuous learning opportunities by participating in in-service workshops, seminars and conferences where they have the chance to know other teachers, schools and programs (Quiambao, 2004).

The dimensions of the survey which is an evaluation instrument were distinguished as the items of general structure of the school, school employees, school administration, school-family cooperation and students. The general structure of the school, the safe environment provided by the school, physical equipment, rules or values of society, cleanliness and hygiene considered as the general rules of the school while the school workers item is thought as the composition of the conscious of us, the positive communication between the workers as whether the mutual decisions are taken or not, as for the school administration is thought as to whether the management supports the creative thoughts or not, overlook to problems, and whether it cares about its workers and their

problems or not being as a direction. School-family cooperation is called the school's dialogues with parents and effective communication, while the items related to the students are named as the financial status of the student, whether he / she can get support when he / she has a problem or if he / she complies with the school rules.

The organizational philosophy of the school is based on certain beliefs and values. This philosophy allows the school to act jointly. When the school's organizational philosophy supports an innovation initiative, this innovation initiative can be successful. As every action is based on a thought, every educational activity in the school should be based on the organizational philosophy of the school (Çelik, 2002: 64). As a result of participating in the activities in the school, teachers understand how to act in that school, what kind of personality that school has, and which common beliefs they have. Teachers who adopt school culture better and adapt to this culture become happier and more productive in their work (John, 1999: 1037).

School culture is a structure that can be felt as soon as you enter the school building and we can have more information as we observe the students, teachers and employees in the school. A lot of information can be obtained from the physical structure of the school, the garden, the benches in the garden, the corridors, the classroom layouts, the boards, the teachers' relationship with the students and the expressions on the faces of the school. Based on this literature; "How school culture affects teacher behaviours in the research "will be the problem of this research.

Sub-Problems

- a) How does school culture affect teachers' behaviors according to teachers' viewpoints?
- b) Is there a relationship between teachers' behaviors shaped by school culture and the following variables?
 - 1) Gender and age
 - 2) Marital Status
 - 3) Professional seniority
 - 4) Educational background
 - 5) Branch

Method

Research Model

Survey model is a kind of research model approach which aims at describing a state which existed before or still exists as it was/is. Research case, whether it is a person or an object, is defined on its own terms and as it is. (Karasar, 2008).

In this research, in which an answer to how school culture affects teacher behaviors was sought, a descriptive survey model was used as the case was defined as it was; that is; the effects of school culture on teacher behaviors were identified.

Study Group

Research population consisted of 164 volunteers of 1500 teachers who work in state or private schools in 2017-2018 School Year Spring Term in Başiskele Province in Kocaeli city. As seen in Table 1, 78% of research sample is female while 22% is consisted of males. 11% of the attendants are between the ages of 21-25; 37,8% are between 26-30; 25,6% are between 31-35; 6,1% are between 36-40; 19,5% are 41 and above . The 53,7 of the attendants are married while %46,3 are single. The professional experience of the attendants are as follows: The 39 % are between 0-5 years of experience; 30,5 % are between 6-10 years; 12,2% are between 11-15; 4,9% are between 16-20; 2,4% are 21-25 ; 11% are 26 years and above. 1,2 % of the teachers who participated in the research have associate degree; the 73,2 % have bachelor degree and 25,6% have master's degree. There are no

participants who do PHD. When we look at the data about master's degrees, it is seen that 1/4 of teachers have master's degree.

Data Collection

Firstly a literature review was done about the topic for this research. As a data collection medium, a scale composed of two parts which are personal information form and Teachers' Behaviors Scale which was developed by Arpaguş(2011) was used.

With the questions in the part of Personal Information Form, the data about teachers' gender, age, marital status, professional experience, educational background and branches were collected.

In teacher behaviors scale possible behaviors which could be observed in the scale were designated as 1) I work more actively 2) I am motivated 3) I accommodate myself 4) I am not affected 5) I try to change 6) I accept the situation 7) My motivation decreases 8) I feel stressed. As a result of factor analysis which was done in order to determine the construct validity of the scale, the scale was divided into five dimensions which are related to general school structure, school staff, school administration, school-family cooperation, and students. As a result of reliability analysis Cronbach a value of teacher behavior scale which is composed of 43 items were found as 0,768. This value was seen satisfactory in terms of reliability of the scale as it was higher than 0,70. If the Skewness and Kurtosis values are between +1,5-1,5, that the scale shows normal variation is supposed. Coefficients of skewness and kurtosis of subdimensions of the scale which are the items related to the general structure of schools (S=-,515 K=-,403), the items related to school staff (S=,178 K=-,297), the items related to school administration (S=-,235 K=-,403), the items related to school-family cooperation (S=,275, K=-,335), the items related to students(S=0,88, K=,621) are identified between -1,5 and +1,5. That is; the assessment instrument shows normal contribution.

Analysis of the Data Findings

Findings related to teachers personal information

The table below gives information about the contribution of the variables of gender, age, marital status, professional experience, educational background and branches of the teachers who composed research sample in the research process.

Table 1. Total points and Arithmetic Average of Teachers' Attitude Scale and Subdimensions of the Scale

Teachers' attitude scale subdimensions	N	x	Ss	5 point Likert Scale
<i>Items related to general school structure (10 items)</i>	164	36,0488	,418	3,60
<i>Items related to school staff (15 items)</i>	164	41,8171	,457	2,78
<i>Items related to school administration (15 items)</i>	164	16,3780	,249	3,27
<i>Items related to school administration (7 items)</i>	164	20,7439	,279	2,96
<i>Items related to students (6 items)</i>	164	17,7561	,291	2,95

The standart deviation of the items related to general school structure was found out ,418 and the average was found out 36,0488. The standart deviation of the items related to school staff was found out ,457 and the average was found out 41,8171. The standart deviation o the items related to school administration was found out ,249 and the average was found out 16, 3780. The standart deviation of the items related to school-family cooperation

was found out,279 and the average was found out 20,7439. The standart deviation of the items related to students was found out,291 and the average was found out 17,7561. When we look at the Likert test, we see that the items related to general school structure ara not much effective in changing the situation and they tend to adopt the situation in the items related to school staff, school administration, school-family cooperation and students.

Table 2. T-test results of the effect of organizational culture on teachers' behaviors according to gender variable

Scale Items	N	\bar{x}	Ss	sd	t	p	5 point likert scale
<i>Items related to general school structure</i>	128	36,3438	,43591	4,93172	1,334	,184	3,60
	36	35,0000	1,10267	6,61600	1,133		
<i>Items related to school staff</i>	128	42,1719	,47230	5,34349	1,466	,226	2,78
	36	40,5556	1,22956	7,37736	1,227		
<i>Items related to school administration</i>	128	16,3750	,27011	3,05591	-,023	,982	3,27
	36	16,3889	,61241	3,67445	-,021		
<i>Items related to school administration</i>	128	21,0781	,33250	3,76183	2,284	,024*	2,96
	36	19,5556	,42247	2,53484	2,832		
<i>Items related to students</i>	128	17,8906	,33391	3,77775	,869	,386	2,95

(*p<,05: There is a significant difference)

Whether teacher behaviors change according to gender was analyzed via t-test. A significant difference found out in the school family cooperation items according to gender variable . (t=3,76= 2,284;p<05). When arithmetic average values were analyzed , it was observed that females tended more to school family cooperation compared to males. (Female=4,214; male=3,91; t=3,76=2,284; p=,024).

Table 3: The Findings RelatedTo The EffectOf Organizational Culture On Teachers' Behaviors According To The Age Variable

Dimension	AGE	N	Mean Rank	df	X ²	f	p
<i>Items related to general school structure</i>	21-25	18	66,61	4	6,698	1,903	,153

	36-40	10	60,70				
	41 AND ABOVE	32	60,00				

($P > ,05$: There is no significant difference. $P < ,05$: There is a significant difference)

Kruskal Wallis H-test was applied in order to identify teacher behaviors changed according to age variable and because of the fact that number of samples in the age categories are less than 30.

Items related to general school structure ($f=1,903$, $p=,153$), items related to school staff ($f=,792$, $p=,561$), ($f=6,580$, $p=,000$), items related to school administration ($f=1,152$, $p=,343$), items related to students ($f= 3,811$, $p= ,000$).

Items related to school administration and items related to students ($p= ,005$) were identified as $p < 0,05$.

There is no significant difference in the items related to general school structure, items related to school staff and the items related to school-family cooperation.

LSD test was applied in order to find out in which age category there are differences in the items related to school administration and students. According to LSD results there is a significant difference according to the age category in the items related to school administration and students.

According to the age variable there is a significant difference in 21-25 age group , 26-30 age group and 36-40 age group in the items related to school administration.

Also, there is a significant difference between 26-30 age group and 31-35 age group. There is a significant difference again between 31-35 age group and 26-30 age group. There is a significant difference between 36-40 age group and 21-25 age group. There is a significant difference between 41 and above group and 26-30 age group. The reason behind these significant differences is that teachers have different approaches to school administration and students according to their ages. While young teachers were more idealist, senior teachers are more realistic.

In the items related to students there is a significant difference between 21-25 age group and 31-35 age group. There is a significant difference between 21-25 age group and 31-35 age group. There is a significant difference

between 26-30 age group and 41 and above age group. There is a significant difference between 31-35 and 21-25 and 41 and above age groups. There is a significant difference between 36-40 age group and 31-35 age group. There is a significant difference between 41 and above and 26-30 and 36-40 age groups.

Table 4. The Findings related to the effect of school culture of teachers behaviors according to the professional experience variable. (Anova Test Results)

	Toplam	164 17,75 3,73	Toplam				

According to the results of Anova Test which was done in order to determine whether teacher behaviors change according to the variable of professional experience, it is seen that there is a significant difference in the items related to school administration ($p=,028$) ($f=,775$) and students. LSD test was applied in order to determine in which group of professional experience the difference in the items related to ($p=,000$) school administration and students was seen.

According to LSD results;

There is a significant difference between 0-5 years of professional experience and 6-10 years ($p= 0,007$) and 21-25 ($p=0,069$) years. There is a significant difference between 6-10 years of professional experience and 0-5 years and 11-15 ($p=0,013$) years. There is a significant difference between 11- 15 years of professional experience and 6-10 years ve 21-25 ($p=0,048$) years. There is a significant difference between 16-20 years of professional experience and 6-10 ($p=0,106$) and 21-25 ($p=0,09$) years. There is a significant difference between 21-25 years of professional experience and 0-5, 11-15 and 16-20 years. There is a significant difference between 26 years and above years of professional experience and 16-20 ($p=0,49$) years.

In the items related to students;

There is a significant difference between 0-5 years of professional experience and 6-10 ($p=0,025$) ve 16-20 ($p=0,001$) years. There is a significant difference between 6-10 years of professional experience and 0-5, 16-20 ($p=0$) and 26 and above ($p=0,011$) years. There is a significant difference between 11-15 years of professional experience and 16-20 years. There is a significant difference between 16-20 years of professional experience and 0-5, 6-10, 11-15, 21-25 and 26 and above ($p=0,079$) years. There is a significant difference between 21-25 years of professional experience between 16-20 years. There is a significant difference between 26 and above years of professional experience and 6-10, 16-20 ve 21-25 years of professional experience.

Result, Argument and Suggestions

The obtained results and the suggestions which were improved based on these results takes place in this part of research. This research was done for the aim of determine how the school culture affects the teachers' behaviors. Also, the meaningful relation was sought between teachers' genders, ages, marital status, seniority, educational background and their faculties to teachers behaviors depending on their school culture in the direction of the subgoals of the research.

- When we evaluate the research results on the basis of similar research, Arpaguş (2011), it was seen that the positive cases about the school culture motivate teachers and enable them to work more actively, but the negative cases cause to be demotivated, get stressed, and also it was seen that teachers try to change this situation. When these results were considered, firstly the positive and negative cases about the school culture

should be set and the causes of these situations should be researched to work more productive. The necessary arrangements should be done to correction of the negative cases or to whip positive cases into shape.

- While the correction of the negative cases prevent the falling of product, making the positive cases into better conditions makes teacher work more actively. So, it will reflect on students positively. Because the managers are seen as the director of the regulations and variance of the school culture, the managers have the biggest responsibility about that topic. The managers should arrange the school culture in such a way that taking the highest rating from teachers and students.

When the whole datas come up in general, it was seen that the positive cases about the school culture affect the teachers' behaviors positively, teachers get motivated or work more actively; the negative cases get the great majority of teachers demotivated or they try to change the situation.

There should be a connection between the school's goals and individuals' goals(Özdemir, 2000, 18). Ensuring that connection is the most important step of composing of the school culture. (Şişman, 2011). It is said that the schools which have the school cultures are effective schools at the same time.

When foreign examples are investigated, J. Barr's research about "the relationship between teachers' empathy and perceptions of school culture shows that the relationship between teachers is related to their perception level of school culture and positive school culture affects teachers' relationship directly. As another example, Andreas Kythreotis's study "The Influence of School Leadership Styles and Culture on Student Achievement in Cyprus Primary Schools" shows that styles and cultures of school administrators have a different effect on different grades. For instance, while school culture affects student achievement in class X, it may not have an effect on class Y. This shows that how school culture phenomena is perceived has an effect on student achievement. In Lassig Carley's research (2009) "Teachers' Attitudes Towards the Gifted: The Importance of Professional Development and School Culture" , effects of school culture and professional development were investigated and it was found out that school culture has an undeniable effect on teacher behaviors.

- According to these results, if the educational institution has the school culture which was adopted by the whole workers, there is a healthy school style. And it makes the educational institution successful school. In other words, the school culture, school climate and the education quality of the school act parallel with one another. One of them can affect the other one in positively or negatively.
- According to variables in survey; while there isn't any significant difference between questions about the general conformation of the school, questions about school workers, questions about the school administration and students, there is a significant difference about parent-teacher association questions. This reflects us that women and men teachers think differently about parent-teacher association.
- According to age variable; there is a significant difference about the school administration and students questions. This shows us that the age variable has a great effect on students and school administrations questions. According to years of seniortiy; there is a significant difference about school administrations and students. This shows us that the view of the teachers about school administrations has discrepancy related to their years of seniority. As teachers age and seniortiy has increased, the adaptation to organisational culture has increased further.

When we compare this project with the others, in a sample of Arpaguş(2011);

- Teachers are agree with the positive questions, they feel more motivated when they see a positive school culture or a teacher behavior. Likewise, when they see a negative case, they get demotivated or they accept the situation. It is seen that they are not unresponsive and they try to change the situation in some cases. The leader

of the organization has an important role on composing the school culture. If a good leader raises, there will be a good organization culture.

- When compared with another study, Erdoğan (2017); educational institutions are the organizational structures that should have continuity and maintain their social existence through certain relationships. Creating a healthy school culture is not an easy task. It is a process that requires planned and programmed work. In this case study, social and cultural characteristics of these structures are explained in certain aspects. School is not only an organization that produces culture, but also an organization that transfers culture (Çelik, 2002, 43). Therefore, it is necessary to establish a very good Likewise, the importance of giving importance to school culture is evident in our own study. communication network within the school in order to transfer the cultural values of the school to the future generations in a healthy way. In addition, as a result of the study, it has been clarified what the school culture affects or what it is affected by and its reflection on the education environment and quality.

- In another study, Karadağ (2015) when the opinions of the school principals participating in the study are examined, It is seen that they draw attention to task culture and cultural elements that point out the basic values of school. Similar to this finding of the study, Hoy and Miskel (1991) listed the elements of school culture as learning and teaching cooperation, efforts for academic success, and openness in communication. Terzi (2005), on the other hand, defined the dominant cultural elements within the framework of bureaucratic culture, support culture, achievement culture and duty culture classification. In the research conducted by Oğuz and Yılmaz (2006) with teachers, it was concluded that the existing cultural structure in primary schools is more of a “support culture” dimension.

- When the studies on organizational culture are examined, it is observed that there is a high level of cooperation and solidarity among the employees in the organizations with strong organizational elements, there is an increase in the motivation, commitment and performance of the employees (Erdem and İşbaşı, 2001) and the organizational success depends on the strong organizational structure (Lawrence, 2000). Terzi (2000) stated that the school should have an effective organizational culture in order to transfer social culture which is one of the universal aims of the school to the younger generations, to ensure the socialization of the individual and to gain knowledge, skills and attitudes in the desired direction. In defining the weaknesses of school culture, it is seen that the emphasis is placed on weak cultural elements that arise from teachers and students, and on the negative effects of physical structure and insufficiencies of the school budget. Studies of school culture indicate that the architecture and physical structure of the school building give messages about what is important and valuable at school. It is known that physical environment strengthens the commitment to school in many aspects. Symbols and artifacts within the school can be a message of the school's important values and beliefs. However it is thought that weak school culture characteristics such as irregularity based on sincerity, lack of communication, failure to develop a school climate based on honesty and trust will cause possible problems such as members' developing low success expectation against each other, loss of motivation, increasing suspicion and hostility, observation of destructive conflicts, lack of school commitment behavior, nonparticipation in the process of determination and adoption of rules, the emergence of communication problems and reduction of love and respect. As a matter of fact, Robbins (1994) stated that in organizations with weak organizational culture, the ties between employees are quite loose.

- Creation or modification of culture; It is difficult in organizations such as schools, where cultural, organizational and political factors influence the decision-making process. There may also be psychological and attitudinal barriers to the intended change process (Berry, 1997). In particular, external threats constitute an important obstacle to change school culture (Buch and Rivers, 2001). In addition, trust and cooperation should be combined to achieve and sustain the performance culture (McGraw, 2003). Successful school leaders develop a culture of collegiality, collaboration, support and trust and this culture takes root within the leader's democratic, social justice values and beliefs (Gurr, Drysdale ve Mulford, 2005). In such an environment, school

leaders empower, approve and appreciate employees. Moreover, leaders support creativity, collaboration, teamwork, trust, problem solving, open and honest communication. As a result of these, employees have the sense of belonging. Employees integrate with their organizations (Davenport, Schwartz ve Elliott, 2003).

- According to the data obtained from the research, the majority of teachers who feel that they are not supported by the school administration have stress or their motivation decreases. It is seen that the inadequacy of the physical structure in the school limits the ability of teachers to carry out their in-class activities, so that an effective learning environment does not occur and their motivation decreases. The Ministry of National Education may revise old schools and assist schools in providing missing materials to solve these problems.
- In addition, teachers can be provided with in-service trainings on issues related to the development of school culture. Thus, it can be ensured that teachers carry out various activities in order to create a strong culture in the school.
- The concept of school culture can be made available to parents, students and other school staff.
- The impact of school culture on student, school principal and parent behavior can be considered as a different research topic.
- Strategies to strengthen school culture can be identified with the participation of shareholders.

Abstract

Over the last decade, in practice, youth work has become more and more an innovative part of social work that has helped to achieve European goals for the sustainable development of the individual and society. Despite the lack of normative regulations, established standards in practice and state educational standards in the field, the practice of youth work is one of the mechanisms for social inclusion of this risk group from society through its means of action - training, mediation, counseling and support. Regardless of the different definitions of youth work, a unifying element is to define it as a means of personal development, social integration and active citizenship among young people. The practice of social work with young people calls for a focus on them as a potentially vulnerable group at risk of poverty, violence, discrimination and social exclusion. Young people are among the most affected by the economic and social insecurity surrounding our society, as well as by the collapse of the ethical and moral norms of modern times. Social youth work is subject to the principle of lifelong learning, as its main contingent is the people under the age of 29, those who have dropped out of the education system who have completed their formal education or are unable to study there. In the context of the present, youth work is a critical factor for personal, professional and social development. Today's challenge is to build a unity between the social sphere, formal education and lifelong learning so as to create prerequisites for building a person who is competitive on the global labor market. In this way, it responds to the expectations of society related to the establishment and consolidation of a sustainable social and educational system that responds to the diverse needs of the citizens of today's democratic society and provides access to optimal learning conditions. The purpose of this article is to draw the link between social youth work and the principles of lifelong learning - elements that promote social inclusion. In addition to the positives, problematic areas of practice have been highlighted to guide the discussion towards validating this share of social work. The present analysis has the ambition to draw conclusions to support the process of validating practice and acquiring the legitimacy of youth work.

Keywords: Social, Inclusion, Lifelong learning, Youth

Introduction

The modern thinking and contemporary lifestyles reflect on individuals, families, society, and socio-political dynamics reflect on the most vulnerable groups in the countries, such as adolescents and young people. Good practices, reflecting European and national policies, create compensatory mechanisms to prevent social exclusion and social passivity. These, adapted to local reality and environmental conditions, are a positive model for social inclusion and prevention through activities based on non-formal education. It is in the practice of the youth worker that the link between social work and lifelong learning is formed as a support for social inclusion.

The European Community is primarily committed to creating conditions for equal social, economic and educational opportunities for young people. This is clearly demonstrated in the Treaty on the Functioning of the European Union (Articles 19, 145-150, 151-161 TFEU), in which the fight against poverty and social exclusion is defined as fundamental for the European Union. (Treaty on the Functioning of the European Union

(TFEU)) Another key document containing the vision, priority axes and activities to prevent exclusion and social inclusion is "Europe 2020: A strategy for smart, sustainable and inclusive growth" which follows the new European pathway, geared towards creating a sustainable future and improving the living standard of the modern human. The main goal of the strategy and the national plans for its implementation are the reduction of demographic, social and economic problems accumulated over the years. (Europe 2020: A strategy for smart, sustainable and inclusive growth, COM (2010). EU, 2010) The analysis of this article is linked to the need to clarify key concepts such as "social inclusion", "youth work", "lifelong learning". The authors of the article adhere to the formulation in the concept of the Social Inclusion General Report from 2004, which states that "Social Inclusion is a process that ensures that people at risk of poverty and social exclusion are given the opportunities and resources they need to participate in economic, social and cultural life and enjoy the standard of living and well-being considered for normal in the society in which they live. This process ensures greater participation in the decision - making process that affects their lives and greater access to functional human rights." (Joint report on social inclusion, European Commission in the Social Protection Committee, 2004) In this sense, social inclusion as a process means creating conditions for equality and equal opportunities among vulnerable groups of people to facilitate their full participation. Object of our attention is this group of people we designate as young people. They, according to European regulations and the Law on Youth in Bulgaria, are "persons aged 15 to 29 years" (Law on Youth, Prom., SG, no. 31 of 20.04.2012) The main aim of the authors is to track the opportunities for social inclusion of young people up to 29 years of age through youth work. It is seen as an innovative part of the social work. The legal definition of the term "youth work" is defined in the Recommendation of the Committee of Ministers as "... covering a wide range of social, cultural, educational, environmental and/or political activities through, with and for young people in groups or individually. Youth work is done by professionals and/or volunteers and is based on non-formal and informal learning processes targeted at young people. Youth work is a typical social practice ... " (Recommendation CM/Rec (2017)4 of the Committee of Ministers to member states on youth work)

In the focus of youth workers are young people up to 29 years, often coming from vulnerable groups - those at risk of poverty and social exclusion, dropouts from the educational system, minority groups. It is here that the practice of social work with young people is based on the concept of lifelong learning. It is a modern formulation of the idea that people learns while they're alive. The characteristics of lifelong learning are set out in a number of community documents. The European Commission is developing a "Lifelong Learning Memorandum (2000) which ..." sets the foundations for the further development of youth policies in education and training by addressing the need for lifelong learning and explicitly identifying aspects of non-formal learning ... " (Memorandum on lifelong learning, SEC 2000 (1832), Commission of European communities) The document raises the issue of recognition of competences acquired through non-formal and informal education and underlines the importance of European youth programs. As a result of the Memorandum, a European Reference Framework for Key Skills for Lifelong Learning has been established defining eight key competences. In this way, the European Union focuses on developing specific "key competences" for young people, as described in a

Recommendation of the European Parliament and Council of Europe, covering the acquisition of "knowledge, skills and attitudes that help learners achieve personal fulfillment and, at a later stage of their lives, to find work and participate in the life of society ". (Recommendation of the EU Parliament and of the CoE 18 December 2006 on key competences for lifelong learning)The main aim of the present work is to show the possibilities for social inclusion of young people in the society through youth work and lifelong learning.

Youth work as a form of social work

The authors of the article accept youth work as a form of social work that handles informal educational methods. It covers various target groups, including young people dropped out of the education system, graduates, those who identify the need to acquire new knowledge, skills and competences. It is here that it is necessary to present and analyze the essential theoretical and practical legal acts, related to social inclusion through youth work and lifelong learning in the sense of their scientific and practical significance.

In the specialized literature, the history of youth work is seen as a history of unfinished professionalism. (History of Youth Work in Europe, p. 213, 2003, CoE) This is clearly visible in the practice review in the different countries and the professional characters that are filled with this share of social work. Regardless of the different traditions and definitions, there is a common understanding of the core function of youth work, which is defined in the Committee of Ministers Recommendation, and according to which "youth work motivates and supports young people in seeking a constructive path in life, contributing to their personal and social development, and for society as a whole. " (Recommendation CM/Rec (2017)4 and exploratory memorandum, 2017, CoE)The aim of the profession is to support the social inclusion and learning of those young people at risk of social exclusion. This is achieved by empowering and engaging young people in initiatives and activities tailored to their needs, interests, ideas and experiences. These processes are based on non-formal and informal learning, in which they acquire the knowledge, skills, values and behavior necessary for their personal development. For non-formal education we understand "any organized educational activity conducted outside the formal system of providing selected types of training to specific subgroups in the population, adults and children" (Coombs & Ahmed, 1974 , p. 8). The definition of informal (or aformal) learning was given by the European Commission in 2001, defining it as "learning as a result of everyday activities of man, related to his work, family and leisure. It is not structured and usually does not lead to certification. It may be conscious, but in most cases it is unconscious (or accidental, by accident). "(European Commision, Communication of life long learning, 2001, 32-33).

In many European countries there is no professional and educational profile of the youth worker. In Bulgaria, with the introduction of the Youth law, the term "youth worker" is defined for the first time in a normative act. According to Art. 32. of the Youth law: "A youth worker is an adult who has undergone special training for youth work and/or has gained professional experience of working with youth and performing youth activities." (Law on Youth, Prom., SG, no. 31 of 20.04.2012) In the National Youth Strategy in Bulgaria (2012-2020), youth workers are seen as the main resource for the implementation of the youth policy objectives and states that they

are specialists with a significant role for the personal, social and economic development and empowerment of young people. (National Youth Strategy (2010-2020), adopted by the Council of Ministers on 06.10.2010) In the course of meeting the goals of the European and national strategies, the profession of "youth worker" was introduced into the National Classifier of Occupations and Positions in Bulgaria, but the country still lacks a commonly accepted definition of what is youth work and what is the professional and educational profile of professionals. The practice of social youth work indicates that the youth worker does not require excessive unilateral specialization, and "everyone must have as much professional knowledge as possible". (Role of ethical principles in social work team in sheltered housing, K. Benkova, N.Vlaeva, S.Georgieva, Trakia Journal of Sciences, vol 13, 2015)

In this regard, the profile of the specialist involved in social work with young people is clearly demonstrated in a study by the Ministry of Youth in Romania in 2016. It states that the youth worker should have a large set of knowledge and skills to work in a multicultural environment, flexibility, skills to handle different mechanisms to prevent social exclusion, to master informal learning approaches, to have consultative capacity and empathy. (Study of the needs of youth centres and youth workers, FITT, 2018).

All these requirements to the practice of the youth worker are a guarantee of effective social inclusion. However, the issue of professional and educational training of specialists is also coming to the fore. Although in the Recommendation of the Committee of Ministers for Youth Work one of the top priorities is to build a coherent and flexible, competence-based framework for education and training in a European context, the youth worker may have a different kind of education, putting him in a situation, in which the professional guild does not accept it either as part of the social sphere or as a pedagogical frame. The need for an educational and professional framework of the "youth worker" specialist requires the utmost attention to ensuring adequate education and vocational training for employees in the sector. Reflection of the lack of professional training is the problem of quality of service for young people, against the backdrop of ever-increasing needs.

Lifelong learning as a form of social inclusion

Such practical cases are relevant not only to the profession of the youth worker but also to the concept of lifelong learning. Policies relevant to the formulation that a person learns while he is alive are also the subject of contradiction and "are repeatedly described as highly fragmented, sporadic and often contradictory in their goals, in terms of their target groups and means of implementation." (Dimensions of young adult policies impact on a comparative principle at an European level, Yulia V. Dzhabarova, Blaga P. Madzhurova, Stefan A. Raichev, Dobrinka I. Stoyanova) With regard to practice, lifelong learning is based on three main forms:

- Formal education and learning;
- Non-formal learning;
- Informal learning.

It, like the youth work, falls into a complicated situation where there is a gap between acquired knowledge and skills and their validation. Responding to identified challenges and a strong focus on youth issues, the EU 2020 Strategy for Smart, Sustainable and Inclusive Growth was launched a decade ago. In the framework of the "Youth in action" and "Agenda for new skills and jobs" flagship initiatives, the European Commission is committed to promoting recognition of non-formal and informal learning and calls for the development of knowledge, skills and competences to achieve economic growth and employment. The accompanying flagship initiatives underline the need for more flexible training models that can improve the entry and advancement of the labor market, facilitate the transition between work and learning and stimulate the validation of non-formal and informal learning. (Europe 2020: A strategy for smart, sustainable and inclusive growth, COM (2010). EU, 2010). This strategic document reflects European education policy, focusing on topical issues related to youth, lifelong learning and knowledge-based economy, thus shaping informal education programs.

Responding to Europe's needs to foster the personal development of young people, the Erasmus + program. It is a work of the EU and aims to support education, training, youth and sport in Europe, thus contributing to the Europe 2020 strategy for growth, jobs and social equality. The specific issues on which the program is working are:

- Reducing unemployment, especially among young people;
- Promoting adult education, especially the building of new skills and skills that are sought by the labor market;
- Encouraging young people to participate in European democracy;
- Supporting innovation, cooperation and reforms;
- Reducing early school leaving;
- Promoting cooperation and mobility among EU partner countries. (ec.europa.eu/programmes/erasmus-plus/about_bg)

Another European Union initiative launched in 2018 is the European Solidarity Corps. It enables young people between the ages of 18 and 30 to volunteer or work on projects in their own country or abroad to help people in difficulty. The program implements European solidarity values in practice and provides the opportunity to learn new knowledge and skills. (europa.eu/youth/SOLidARity_bg).

In order to be practical, the knowledge and skills acquired should be validated and certified. The lack of documented evidence is an obstacle to the effective inclusion of vulnerable groups in the social, labor market and economic life of modern society.

Conclusion and recommendations

This article attempts to analyze the regulatory and policies in Europe on the social inclusion of young people through youth work and lifelong learning. In the course of the study, the political will is clearly demonstrated by

the need to unite the common efforts of the countries of the European Union to create unified legal acts related to the realization of social inclusion and awareness of the positive effects and the importance of validating non-formal education and recognition of youth work in educational and professional space.

Despite the insufficiently developed legal regulations on lifelong learning and youth work, they are in practice invariably linked and support the process of social inclusion of young people up to 29 years. The study of international, community and national norms shows that they are incomparable, as in Bulgaria there are no specific parameters and legal norms of non-formal education and youth work, which are an essential element of the social work with young people within the meaning of the European normative framework. In this sense, according to the authors needed to validate the practice of social youth work, there are several key elements:

- Legal regulation of youth social work;
- Professionalization of the profession of "youth worker";
- Creating educational standards for youth work;
- Establish mechanisms to validate the knowledge and skills acquired through non-formal education in the context of lifelong learning.

Abstract

The Welfare State is increasingly concerned with providing its citizens with an improvement in their living conditions, especially in the protection of universal and free health, free education, unemployment protection and retirement, but to this end it has to obtain financial resources from these same citizens. Each of us thus supports a growing tax burden in return for our social benefits. This study analyzes the tension between the duty to pay taxes and the protection of property in Portugal, to know what is the maximum limit that each one has to pay to avoid confiscation. Methodologically, among others, we rely on the protection of property given by the Convention to the “Protection of Human Rights and Fundamental Freedoms” and the Charter of Fundamental Rights of the European Union, as well as, the judgments of the European Court of Human Rights, in addition to statistical data of the Portuguese Tax and Customs Authority.

Keywords: Fundamental Rights, Social State, Taxes; Property Protection

Introduction

Our analysis focuses on the study of the main Human Rights instruments under the First, Second and Third Generations, intertwined with the interpretation applied in the rulings of the European Court of Human Rights, delivered in the Grand Chamber judgments and made available on its website, under the search «*Double Taxation*» and that translates into only twelve.¹

This study is about the obligations assumed by the Minimum and Maximum States towards their people and their integration into their Social Contract and which must necessarily be translated into financial self-satisfaction through fair taxation, whether analyzed in their domestic legislation, above all in the obligations assumed between States, through the norms of International Tax Law, in the international aspect, presenting as an example the tax statistics in Portugal.

Method

The method of the research is based on a technical-legal analysis of the statistical data on income taxation in Portugal, which is drawn up by the Portuguese Tax and Customs Authority, in the multiple International Conventions on Human Rights, and the Judgments of the European Court of Human Rights.

1. From the Human Rights conceptualization and evolution

¹ See link: HUDOC – European Court Human Rights: [https://hudoc.echr.coe.int/eng#{\"fulltext\":\[\"\(\\"double taxation\"\)\]\", \"documentcollectionid2\":\[\"GRANDCHAMBER\", \"CHAMBER\", \"DECGRANDCHAMBER\", \"ADMISSIBILITY\", \"ADMISSIBILITYCOM\"\]}](https://hudoc.echr.coe.int/eng#{\) Consulted on 2019-04-26.

Human Rights require a cross-sectional view based on different dimensions such as historical, political, social, cultural, economic / financial. Oliveira (2012) p. 8². In fact, "universal awareness of the value of fundamental rights, or at least of an essential core of rights linked to the recognition of the dignity of the human person, is one of the most significant political, cultural and legal phenomena." Miranda (1989), p. 7, it has to be interpreted in the global context, time and space, politically, legally and judicially, in its national, regional, international and even organizational dimensions.

Human rights must correspond to what has been defined by the United Nations system and in particular to the *Universal Declaration of Human Rights* of 1948, and everything that pertains to earlier periods should be defined as Fundamental Rights. By the way, when thinking about *citizenship* we should remember Gouveia (2003) pp. 55-56 by stating that «similarly would play a major role in the liberal revolution of the XVIII e XIX centuries, the intention was established to establish the status of person, speaking of the true position of "citizen"». It is because not all and / or all (men and women) were recognized as citizens and, for all this, 1948 marks, thus, the true global recognition of Human Rights for all Humanity.

It's important to be aware that in the Middle Ages the rights assigned by princes arise as rights of each social category, as privileges or prerogatives. The *Magna Carta*³ - See yourself for all, Fernandes (2004)⁴ - does not go beyond that, however the *Petition of Rights* (1628), and the *Bill of Rights* (1689), establish the rights of the English people, as it. However, «the biggest change happened (...) in XVIII century, with the *Virginia Bill of Rights* and *United States Declaration of Independence (1776)*» but the paradigm change was a reality with the *Declaration of the Rights of Man and Citizen 1789*⁵, recognizing the rights to all citizens, considering them, by nature, free and equals.

In 1979 Karel Vasak applies the terminology «generation» in order to demonstrate the evolution of Human Rights along the ideological line of the French Revolution– «*Freedom, Equality e Fraternity*» and Bobbio consecrated the phases of these generations due to the evolution of humanity. Generations are a necessary context for understanding the evolution of Human Rights, but it is true that "the issue of Human Rights is still complex. (...) It puts it at the heart of politics, at the center of relations between Power and the Person. It thus determines the policy rights» Mourgeon (1982), p. 26⁶.

Briefly and succinctly we can say globally that First Generation rights refer to individual rights, civil and political in nature, that is, they are considered the generation of negative freedoms because they limit State power and action. The *Second Generation* develops *Equality* rights - economic, social and cultural - in which the State has an active and intervening role. The *Third Generation* embraces the rights of the community to *solidarity* and *fraternity*. The *Fourth Generation*, which emerges in the 19th century. It is the result of the globalization and universalism of Human Rights. It is related to democratic participation, pluralism, bioethics and the limits of genetics, all supported by the protection and defense of the dignity of the human person. The *Fifth Generation* is mainly based on gender issues and all their complexity. Finally, the so-called *Sixth Generation* sets the limits to genetic manipulation, that is, part of the bioethics plan.

² OLIVEIRA, Samuel Antonio Merbach, A *Teoria Geracional dos Direitos do Homem*. in: <http://www.theoria.com.br/edicao0310/a_teorias_geracional_dos_direitos_do_homem.pdf>. Consulted 26-05-2019, p.18

³ Arising from the Monarchical Parliamentarism, political regime that was implemented in England, after the revolutions of the century of the XVII. The king's power became limited under political control of the State and parliament. From this follows the Magna Carta of 1215 which is to this day the symbol of legislative advancement, as it gives the full right to the "free men" (Men with possessions and members of the Nobility) of England, by the King, who does not should abuse their power to coerce them.

⁴ FERNANDES, António, *Direitos Humanos e Cidadania Europeia – Fundamentos e Dimensões*, Almedina, Coimbra, 2004

⁵ In 1789, the French people succeeded in abolishing the absolute monarchy, allowing the establishment of the First French Republic, thus, after the abolition of feudalism, the Declaration of Human and Citizen Rights, adopted by the National Constituent Assembly which would be the first step towards drafting of the Constitution for the French Republic.

⁶ MOURGEON, Jacques, *Os Direitos do Homem*, Publicações Europa-América, Mira-Sintra, 1982

In a regional dimension, in 1950 the Council of Europe System emerged, with the *European Convention on Human Rights and the Additional Protocols*, as well as the *European Social Charter*⁷, which dates from 1981, which aims to guarantee Human Rights and Fundamental Freedoms to all, recognizing and protecting Housing, Health, Education, Employment, Social Protection, Integration and Participation and Non-Discrimination and the interdependence of United Nations Human Rights legal documents and, in particular, arising from the European Convention on Human Rights.

As Gabriella Battaini Dragoni⁸ said: «*The social and economic rights guaranteed by European Social Charter are fundamental rights which parallel and complement the civil and political rights enshrined in the European Convention on Human Rights. (...)*» e reforça o facto de «*(...) the Charter represents a vital guarantee in terms of safeguarding the exercise of democracy in Europe*».⁹

2. Dependence of the Social Rights and the Principle of Equality: analysis of its evolution and violation through the application by states of their Human Rights tax policies

The focus of the subject of this study focuses on its regional framework and the European Convention on Human Rights and Social Rights in general, and on the Principle of Equality focused on Taxation and its evolution as a legally recognized *right* and *duty*.

An important element of analysis is the reports of the European Court of Human Rights¹⁰, which, due to its intense and fruitful judicial activity, show that there are many violations, including by states, which shows that interventions at national level are urgent for action and resolution, effective in order to prevent Human Rights violations.

But let's start by analyzing the great international moments *The Magna Carta* of 1215 is one of the most influential historical rights documents, and it implements the separation of church and political power and stems from the need to protect citizens from excessive taxes and to protect the right to property and equality by the law, aimed to safeguard personal freedom from abuse of power, and insists that “no free man could be detained, imprisoned, deprived of his property, exiled or otherwise Kingdom Law” Fernandes (2004) p. 25. Concerning the Bill of Rights, signed in England on 1689, declared a diversity of rights, imposing that “the collection of taxes without the granting of Parliament is illegal” by a Rule of Law.

The *United States Declaration of Independence* of July 4, 1776¹¹ contemplates in its genesis the principle of equality and the question of arbitrariness in 'imposing taxes without our consent', a fact of major relevance at the time and the importance attached to the payment of taxes as a need for self-sufficiency, but without abuses of political power. , followed by the *Bill of Rights*, signed in 1789, which reveals a social protection with hanging property, which in addition to being innovative at the time is a right that needed, and still needs, the most attention.

The *Declaration of the Rights of Man and Citizen*, Paris, France, in 1789, implements “a social revolution, calling for the abolition of feudal rights and privileges and the end of the regime of hereditary positions and class

⁷ In its preamble, the European Social Charter states that “the objective of the Council of Europe is to establish a closer union among its members in order to safeguard and promote the common heritage ideals and principles and to foster their economic and social progress. in particular by upholding and developing human rights and fundamental freedoms.” Miranda (1989) p. 253

⁸ Deputy Secretary General Council of Europe, Strasbourg, since 2012.

⁹ *The European Social Charter at a Glance*, Council of Europe (2017), p. 1

¹⁰ *European Court of Human Rights Annual Report* (2017), Conselho da Europa Publicações.

¹¹ Founding document of the United States of America proclaiming the separation of the original thirteen colonies of the United States and leading to the definitive separation of England, also known as the American Revolution. Although initially Independence was not the goal of the Americans, it is certain that the overarching goal was based on the need for the government to pay attention and resolve its claims, a fact that was aggravated by the war and generated such sentiment and need. This Declaration was first published in the newspapers, read to the multitudes, and later taken over by the American Congress.

distinctions, stating that all French became equal before the law. ' Fernandes (2004) p. 41 is based on “*Freedom, Equality and Fraternity*” and therefore on the recognition of substantive - economic, social and cultural rights. Please note that Articles 14, 15 and 17 of the Declaration¹² Social Rights are evident, in particular fair taxation and the protection of the right to property, which has proved to be fundamental to the evolution of the self-sufficient Maximum State. Note that self-taxation Article 14 required that “all citizens have the right to verify, by themselves or their representatives, the need for public contribution, to consent freely, to observe employment, and to fix the breakdown, collection, collection and duration”. This is because “the protection of fundamental rights has for centuries been a recurring object in the course of humanity, representing in some way the search for approximative models of justice and perfection, in harmony with ideological, political-economic and social assumptions. of each historical time, erecting in epicentral desiderate the preservation of the right of every man and every woman to full life.” Poiares, CDHOA¹³ (2005) p. 21.

Internationally and globally, the United Nations in 1945¹⁴ drafted the document of “greater” recognition and protection of human rights, the *Universal Declaration of Human Rights*. So, “maintaining international peace and security, the Declaration aims at achieving international cooperation to solve economic, social, cultural (logo) humanitarian problems” Fernandes (2004) p. 53, among which we highlight the rights to work, fair wages, paid holidays, freedom of association and social security. But we must not forget that the evolution of economic spaces and the heterogeneity of tax systems have led to potentially serious situations such as avoidance, fraud, tax evasion and unfair tax competition, which has required particular attention from the United Nations, in partnership with other international organizations of a specific nature. It is true that every action of the United Nations lies in the effective protection, defense and legal promotion of human rights, but it is elementary to understand that the sustainability of states is of the utmost importance, which requires that the diagnosis and recognition of collective needs and individuals, the building of socially self-reliant states with respect for self-taxation and international law and their national jurisdictions are the path to unconditional respect for Human Rights.

At the regional level, the United Nations system has adopted “instruments, established bodies and established mechanisms for the protection of human rights, in some cases far more effective than mechanisms of universal scope.” Fernandes (2004) p. 72. In this context, the 1948 Hague Congress created the Council of Europe and, consequently, the European Court of Human Rights.

In this context we have a fundamental and most important issue, which is the recognition of the need for tax collection in view of the need for a Minimum State to become a Social State, and therefore, the Maximum State.

It is therefore important to interpret and recognize taxes as the basis for sustainability, from which the dependence on social rights derives, both at the Council of Europe level, in a fundamental line with the European Union, while respecting international law unconditionally.

3. Portuguese Government Budget as a demonstrative element of the collective needs of the Nation

1. Public Finance

¹²*Declaration of Human and Citizen's Rights* (1789)

«Art.º 15.º - The company has the right to hold all public officials accountable for its management.

Art.º 17.º - Since property is an inviolable and sacred right, none of it can be deprived except when legally proven public necessity so requires and subject to fair and prior compensation.»

¹³ CDHOA = Ordem dos Advogados Association - Human Rights Commission (2005).

¹⁴ The *Universal Declaration of Human Rights* is a document of principles that embodies the inalienable rights of individuals. This Declaration was proclaimed by the United Nations General Assembly as a result of the severe atrocities committed by the Holocaust during World War II. (1939-1945).

Teixeira Ribeiro (1997) p. 28¹⁵ explains to us that “The State wants certain collective needs to be met; for this purpose it is proposed to produce the goods; but the production of goods entails expenses; the state therefore needs to obtain revenues to cover these expenses, that is, it needs money, means of financing”. Obviously, the State for obtaining public goods and services, which are intended to meet collective needs, must have financial means. Teixeira Ribeiro (1997) p. 31 and explains to us that government revenues are obtained through equity income, taxes, taxes and loans. It is because the State, especially since World War II, has broadened its intervention in society, Teixeira Ribeiro (1997) p. 31, through the redistribution of incomes and wealth to those with the lowest incomes, promoting economic stability, and ultimately by economic development so that *per capita* income can provide the population with a good standard of living.

2. Government Budget

The Constitution of the Portuguese Republic - CRP - imposes in its article 105 that the annual budget of the State has to make a breakdown of its revenues and expenses and this has a dual function, that is, Gomes Canotilho, JJ e Vital Moreira (2007), p. 1109¹⁶, at the financial level, the State establishes in this management instrument its financial and budgetary appropriations, but, as the people who elect their representatives, they are the ones who create the tax systems and authorize self-taxation on a representative basis every year.

3. The tax system as a source of financial income

Article 103^o of the CRP sets out the three objectives of the national tax system, the satisfaction of the state's financial needs, the collection of taxes, and the distribution of income and after wealth. It is that meeting the state's financial needs is a strictly financial objective of the tax system, Gomes Canotilho, JJ e Vital Moreira (2007), p. 1088, It is important to remember that the other purpose is to make a fair distribution of income and wealth that Gomes Canotilho, JJ e Vital Moreira (2007), p. 1089, translated into the idea of social justice in order to achieve the intrinsic desiderate of the welfare state, even if income is generated outsider, Alberto Xavier (2007)¹⁷.

4. Effective tax collection - Does the tax system respect the principle of fair distribution of income and wealth?

The analysis of the principle of fair distribution of income and wealth that we will make next is based on the statistics made by the Tax and Customs Authority - AT.

1. Statistics of the Personal Income Tax

AT makes available on its portal ¹⁸ statistical data related to the Personal Income Tax - IRS of the year 2017 - and that were extracted from 5 180 463 periodic forms of incomes that generated a total income of € 11934 millions. Thus, in order to understand who actually pays taxes in Portugal to meet state expenses, and to know how the tax burden is divided among the national population, we draw up the table 1:

Table 1 – Effective taxation by income classed

¹⁵ RIBEIRO, José Joaquim Teixeira, *Lições de Finanças Públicas*, 5.^a Edição, Refundida e Atualizada (Reimpressão), Coimbra Editora, Coimbra, 1997.

¹⁶ GOMES CANOTILHO, JJ e VITAL MOREIRA, *CRP – Constituição da República Portuguesa – Anotada*, Vol. I, Coimbra Editora, Coimbra, 2007.

¹⁷ Alberto Xavier, com a colaboração de Clotilde Celorico Palma e Leonor Xavier, *Direito Tributário Internacional*, 2.^a Edição Atualizada, 2007, Almedina

¹⁸ Tax Authority_Portal of Finance

http://info.portaldasfinancas.gov.pt/pt/dgci/divulgacao/estatisticas/estatisticas_ir/Pages/Estatisticas_IRS.aspx – consultado em 2019-07-26

Annual Income Classes	Til 10.000€	From 10.000 € to 19.000 €	From 19.000 € to 40.000 €,	From 40.000 € to 100.000 €	Superior to 100.000 €
Number of Households - by Income Rank	43,48%	28,15%	20,07%	7,45%	0,85%
Personal Income Tax Paid - by Income Rank	2,55%	8,44%	27,55%	40,70%	20,75%
Effective Gross Tax Rate - by Income Rank	2,27%	4,75%	12,50%	21,02%	40,37%

To find out which types of income pay the most taxes, we draw up the table 2.

Table 2 – Breakdown of Income Types by Total Income Set

Income Types	Employment	Self Employment	Pensions	Other Incomes
Gross income by income category in % of total	63,43%	5,23%	27,60%	3,74%

2. Conclusions of the Statistic of the Personal Income Tax

We conclude that the ones who pay taxes in Portugal are the income from paid work and retirement pensions, that means, 91,03% of the tax payers, and that 8,3% of the taxpayers paid 61,39% of the total, 20,07% bore the burden of 12,50% and the others 64,63 just paid 7,02% of all Personal Income Taxes.

3. Statistics Data of Corporate Income Tax

AT makes available on its portal¹⁹ Statistical Data on Corporate Income Tax - IRC of 2017, based on 475 119 periodic tax forms that generated a total tax payable of Euro 4 493 million.

Note that only 50.7% of those taxpayers had positive fiscal results: Table 3.

Table 3 – Relationship between number of tax forms and tax result

Total Number of Forms - 475.119	With tax loss	With Fiscal result = Zero	With taxable profit
Percentage of the Number of Forms by Taxable Result	30,2%	19,1%	50,7%

In order to know the economic dimension of companies in Portugal and which companies, in view of their size, which effectively Corporation Income Taxes we draw up the Table 4.

Table 4 – Relation between the number of societies and the Corporation Income Taxes by the business volume.

Turnover / Year	Till 500 000€	500 000€ to 2,5 M€	2,5M€ to 25M€	Superior a 25M€
Number of the Forms by Types of the Business Volume	87,2%	9,5%	2,9%	0,4%
Corporation Income Tax Paid by Types of the Business Volume	11,8%	12,5%	22,2%	53,5%

4. Conclusion of the Corporation Income Tax statistic

Of these tables we can conclude that, between the 50,7% of the societies that have tax profits, only 3,1% (2,9% + 0,4%) of them contributed to 75,7% of all Corporation Income Tax.

¹⁹ Tax Authority_Portal of Finance

http://info.portaldasfinancas.gov.pt/pt/dgci/divulgacao/estatisticas/estatisticas_ir/Pages/Estatisticas_IRC.aspx – consultado em 2019-07-26

5. Tax Havens - Worldwide Problem in the Fair Distribution of Tax Burdens

The use of tax havens represents a significant loss of tax revenue for the state coffers, leading some to cease to contribute according to their real economic / financial capacities and others to do just as much as necessary to cover this escape. income / wealth / wealth for *offshores*.

To exemplify only and only this global storm, we use a report prepared by Richard Phillips and Matt Gardner, of the U.S. Public Interest Research Group Education Fund (U.S. PIRG Education Fund) and by Alexandria Robins and Michelle Surka of the Institute on Taxation and Economic Policy (ITEP), titled «Offshore Shell Games – 2017 - The Use of Offshore Tax Havens by Fortune 500 Companies»²⁰.

The analysis shows how it is estimated that there is an annual loss in the United States alone, and only in taxes to the federation, of about \$ 100 billion, which represents a tax burden for taxpayers alike, less investment and / or less utilities, so that for example the profits of these large *offshored* companies exceed \$ 2.6 trillion and that only four of these big companies, Apple, Pfizer, Microsoft and General Electric, represent a quarter of that total.

6. The ECHR and the freedom of States to create / shape tax systems - analysis based on case law

Taxes are an invasive means of each taxpayer's assets and so we are interested in whether the European Court of Human Rights (ECHR) has imposed limits on states in the taxation imposed on their citizens, or whether they have ample scope to implement their obligations within Taxation Policies.

The judgments of the European Court of Human Rights (ECHR) show us case law based on the recognition of the right of states to formulate and implement their Taxation Policies, and to that end they have a wide margin of appreciation, either in its creation or in its application, assuming that the ECtHR will always respect the evaluation of the legislation created in such matters, and has, on several occasions, understood that the relationship between the demands of the general interest of the people and the proceeds of tax revenue, as opposed to the requirements of protection of Individual Fundamental Rights of each of the concrete contributors must always be sustained in a fair balance between the general interest and the individual interest so that there is a proportional relationship between the legal means that are achieved to obtain the revenue and the desired objectives with their purpose²¹.

The ECHR's concern, in a way, to protect the community in its tax rights, was evident when it decided that states to protect themselves from the avoidance, evasion, tax fraud and unfair tax competition, whether practiced internally or practiced internationally, through the use of tax havens - *offshores* - may use the exchange of information between these²² and²³, by enacting legislation to prevent this abusive reduction in tax revenue

²¹ Please see, what all have state by the Judgement of ECHR P. PLAISIER B.V. AND OTHERS c. THE NETHERLANDS, nos.46184/16, 47789/16, 19958/17, 14 de Novembro de 2017 §71: «According to the Court's well-established case-law, an interference, including one resulting from a measure to secure payment of taxes, must strike a "fair balance" between the demands of the general interest of the community and the requirements of the protection of the individual's fundamental rights. The concern to achieve this balance is reflected in the structure of Article 1 as a whole, including the second paragraph: there must be a reasonable relationship of proportionality between the means employed and the aims pursued. Furthermore, in determining whether this requirement has been met, it is recognised that a Contracting State, not least when framing and implementing policies in the area of taxation, enjoys a wide margin of appreciation and the Court will respect the legislature's assessment in such matters unless it is devoid of reasonable foundation (see, among many other authorities, National & Provincial Building Society, the Leeds Permanent Building Society and the Yorkshire Building Society, cited above, §§ 80-82; and M.A. and 34 Others (dec.), cited above)»

²² Decided by the ECHR Judgement HUITSON c. THE UNITED KINGDOM, in 50131/12, 13-01-2015

²³ Decided by the ECHR Judgements G.S.B. c. SWITZERLAND, in 28601/11, 22/12/2015 e OTHYMIA INVESTMENTS BV c. THE NETHERLANDS, in 75292/10, 16-06-2015

collection, and even the ECHR made decisions in favor of retroactive tax legislation, including to deal with the crisis that plagued Europe at the beginning of this century²⁴.

CONCLUSIONS

It is clear that Human Rights, with regard to the obligation of each citizen with financial values to contribute to the community's expenses, have developed and growing, since the Magna Carta of 1215 until the ECHR

The generational evolution of Human Rights has imposed an evolution in the functions of the state, which went from a Minimum State to a Maximum State, with new tasks but which demand from the community, the people, a greater tax burden.

As the wellness collective overlaps the individual, it has to be through a fair balance, words of the ECHR, that a key point must be found between the collective right to collect taxes and the necessary collective expenses with the invasion of individual citizen heritage to pay their taxes.

We can conclude that the ECHR has always agreed with the tax systems set up by States to finance themselves, even if it entails taxes with retroactive effect in times of crisis, or to address possible tax evasion and evasion schemes, as well as the exchange of tax information for this purpose, imposing only and only on the part of the States the guarantee of the principle of the search for the material truth and its effective control by the Judicial Power, reason why even if each one of us surrenders to the State, through the payment of taxes most of its heritage, this will not be a real confiscation as long as, in the words of the ECHR, there is such a fair balance between collective need and individual protection of property.

Abstract

The education in nowadays European legal structure and strategic political context/action(s), as well as, within the UN System advocates the unquestionable respect for differences, quality education and equal opportunities for “all”. The social, economic, ethnic, cultural or religion characteristics of the educational structures, for students and teacher/professors, should be considered as a “natural wealth”. It’s important to state that education system should recognize the differences and develop a team work to promote the diversity in the pursuit of the guaranty of the equality in access, in the study stay as in the results, ensuring the teaching, the learning and the human strategies and resources conducting to the future society based on the promotion and defense of Human Rights in general, and in the European Fundamental Rights, in particularly.

Keywords: Rights, transdisciplinary, integration policies, education for diversity.

Introduction

Although all legal and political strategies, this context is complex, as there are serious problems the European Union is facing concerning the education system, as there is a serious conflictual conjuncture due the most different reasons: the pedagogical strategies, the non-updated programs, the absence or fragile education for the diversity. There is legal (juridical and judicial) consequences but the individual and group effects are serious and should be object of an urgent intervention. There are instruments to implement the diversity education and specially the effective integration, however this is more “virtual” than real. Considering the actual social complexity but the important education instruments and strategies, mostly patented in the policies, this paper aims expose the existing contexts opposed to the laws, policies and education for the diversity and to the real inclusion. More than a single study, this research aims to develop a map of the reality and the guidelines to implement the action.

This paper presents a set of theoretical reflections in the disciplinary interface between legal and education sciences, school administration and management, with the aim of understand the real inclusion characteristics in a balance with the inclusion policies and the need(s) of an education for Human Rights, especially for diversity. The transdisciplinary is a pedagogic and social education perfect approach using the Human Rights binomial – teaching and learning – supported by the inclusion laws according to the realistic needs for an effective successful society construction.

Method

The qualitative research developed, based on the historical, legal and political science perspectives, since the first moment had the main objective to identify the main problems and Human Rights, as fundamental rights, violation; the legal context and the law enforcement and the consequence judicial position. The research method allows us to develop the perspective of the politics and political actions, within the sustainability based on the law and democratic values, toward the protection of all Human beings.

Findings

Researching, thinking and discussing Human Rights, from the West to the East, in the present world, is fundamental, reveals an unquestionable necessity, but a "dangerous" context due to all historical charge, such as concepts and understandings without scientific interpretation, as well as, effective practice. It is difficult to identify a historical period in which human rights have been so mentioned, as it is today. However, there are dangerous actions with the most serious human consequences; dissemination of information without the necessary contextualization, supported by legal facts and procedures, such as an explanation adapted to the target public (individual or groups / societies) in their different realities. Thus, Human Rights are part of the Agendas of democratic states, it is a priority of the Media, in the social discussions (official and unofficial) in the States, regional groups / Organizations, objectives and actions of International Organizations (Governmental and Non-Governmental). And in the speech of the terrorist groups as a flag to achieve the "recruitment" of their followers, in the name of values completely adulterated and with the most burdensome and violent goals. This problem affects non-democratic, mostly authoritarian states, many of which include human rights and values in their legislation, in their rhetoric, despite their most reprehensible violation of human rights. It is the discourse, in the most different forms and means that generates a disparate perlocution of its content.

Considering the need to define human rights, it can be affirmed that they are those that have been legally defined and recognized by the United Nations since the Human Rights Universal Declaration of December 10, 1948 - for all human beings in the world. world, without exception - as well as all United Nations international legal laws / documents recognized and adopted by UN members. With regard to fundamental rights, it can be defined as all those that are legally defined and recognized by each state or regional organization (such as the European Union).

In fact, International Relations and Policies, on a democratic basis, are developed under the Human Rights values that shape the discourses, as well as actions that promote behaviors and reactions. It is obvious that throughout the world, it can be assumed that no more laws will be needed, but rather their effective implementation, aiming at an effective experience within the highest level of Rights, adopted to protect all human beings. In contrast, there are many (too many) states / governments that need to adopt human rights in their legislation, democratizing their policies to protect their citizens from all forms of violence, rape and suffering in the most diverse dimensions.

However, there are many democratic states that protect and promote human rights, but there is always the challenge of renewing social construction through reflection and realignment of political, social, economic and cultural criteria and actions to implement democratization through a serious and realistic, avoiding the problems diagnosed, preventing potential problems, identifying all the "actors" in society and the "political scenario", acting to proceed in a qualified democracy of, and for, all citizens. This is a realistic and scientific view advocated by Laurence Whithead in May in Bucharest, Romania, based on the idea that the world-wide norm must end democracy by the rule of law, a system of social justice under a structure and political actions. Thus, the vulnerability of the protection, promotion and implementation of the human rights system is in the process of democratization, often fragile and complex, but also the quality of democracy. Thus, if the level is low, surely the political regime will not be able to achieve the values and rights for an active and protected citizenship.

One of the important elements that should be highlighted in this article, this research identified Geopolitics as an actor in the field of International Relations, contributing positively and negatively to democracy by policies - implemented - debated, protected and violated. Let us briefly consider two complementary perspectives.

1. "Physical realities, which go beyond national and international policies, are often devalued, whether in writing about history and contemporary accounts in the business world. Geographically it is evidently a fundamental part of the "whys" just like the "whys". It may be a determining factor, but it is certainly the most underrated."¹

2. "We live in a time when democratic nations are portrayed in the context of geopolitics, when democracy is itself a context. The latter phenomenon was documented in the House of Freedom, in which it was recorded as freedom in the declining world over nine linear years. In the context of geopolitics, the elevation of tectonic plates has generated a systematic reorganization of power, but the rumors are audible (...). Today, as always, democracy is a fragile flower. It requires permanent support (...) In the absence of all efforts, the jungle and the beasts will come, sooner or later, to return and reclaim their land"².

Political scientists have no doubts about the importance of Geopolitics, however, there are several decisions about International Relations and the promotion of human rights policies that do not, or would rather ignore, the potential of this inevitable element. Thus, it is simple to explain some of the success and failure of political, cultural, economic and social measures at an international level. For example, in order to protect as many human beings as possible, especially those in refugee situations, particularly in Europe, could have a different "treatment" if the geopolitical context were taken into account, including democratic agreements, strategies international organizations, humanitarian issues, solidarity, protection and, in particular, the legal implementation of human rights by the United Nations, which could prevent millions of deaths and human suffering in all dimensions.

Another illustration is the current fight against terrorism. There are currently Diplomacy and International Relations experts who present the "Geopolitics of Terror (ism)" with a renewed perspective and proposed action to prevent the proliferation of hatred, but the spread of the ideology of peace by the concerted action and behavior of politicians, governments, international organizations and citizens from all over the world. It is not a simple question or an immediate action, but it can be considered by policy makers.

Keeping the focus on the international context and system of human rights, there is an essential issue that is to integrate democratic governments and organizations as they are in societies: human rights education. However, it is important, regardless, of interpretation, that is included in the difficulties of the specificities for its implementation. This is not a new issue but for international law and relations, especially after the landmark 11 September 2001 (Terrorist Attacks on the World Trade Center in New York in the United States of America) with a new conceptualization of Terrorism and protection systems. Human Rights, education has to be, progressively and so far, a matter on the political agenda: by International Organizations (Governmental, such as the UN, Regionals, such as the European Union), Democratic States / Governments, as well as Associations and International Movements whose purpose is to promote and protect Human Rights.

There is no doubt that the changing paradigm of Human Rights and the need for legal interpretation and effective action, by violence, by violation of international and national laws, known or through manipulative illusory actions, is certain that there are perfectly identified needs. Thus we have two important views:

- the need to implement policies duly approved and legally and judicially recognized by (mostly democratic) governments that aim to protect and promote fundamental and human rights. In this case, the need is for the

¹ MARSHALL, Tim. (2016) Prisoners of Geography. London: Elliot & Thomson. P. x

² "Is the democracy in decline? The Weight of Geopolitics": Article by Robert Kagan in <https://www.brookings.edu/articles/is-democracy-in-decline-the-weight-of-geopolitics/> accessed June 4, 2017.

development of the “force” of policies and laws, as well as citizenship that must denounce the violations and violence that in many (too many) moments are hidden (deliberately or not).

- the needs of millions of human beings who suffer the most distinct violence and violation of international law, including torture and murder. Some are legally protected, but there are no mechanisms to defend or promote the possibility of termination, or even the request for protection. Others live in states where democracy is not a reality, so work is hard at developing work and action to achieve political power, so education comes in two ways: political and law change (difficult, complex and utopian mission, at times) as well as society's knowledge of its (Human and Fundamental) Rights and strategies for its own protection and to denounce all problems.

The world faces many serious and worrying problems, living not only within the most negative contexts, such as wars, authoritarian regimes and dictatorships, but also the harshest human lives. The declared intervention needs democratizing action, under the highest human values, in order to protect as many human beings as possible, solving the most serious problems. It is an effective state of the art in today's world society that leaves open the difficulty and at the same time the need to act. This must be a mission for and for everyone, but unfortunately there are thousands who do not have information, who receive no or very fragile education to be protectors, defenders and activists of human rights. There is no special movement, but active citizenship and responsible action / mission. This is not an idealistic view, but the implementation of international law. There is an important role for international relations developed in the most diverse contexts: special organizations, states and movements could be concerted to support the most important values that support (or should support) relationships. However, history shows that humans have an extraordinary ability to completely change the best and worst scenarios by the most distinguished “actors” for their own protection. In fact, despite all the difficulties and obstacles, humanity is always shown that there is a true and legitimate will, with definite strategies, in a necessary union of important entrepreneurs, which needs time (short or long) but that proves possible by reaching different partial objectives but positive results. Action is the key to change.

At present it is obvious that we experience two different worlds where there is life: the real and the virtual. Both are spaces to protect and / or to attack humans. There are important connections and powerful instruments. When it comes to the virtual world, humanity has a powerful tool to reach millions in seconds. Undoubtedly, it cannot be said that all humanity attains it, but each one has its unquestionable importance. Thus, it is known that radical groups such as Daesh find in the powerful virtual social networks the means to recruit millions with the darkest goals, targeting violence and terrorist actions. Thus, Human Rights Education could, in this “space”, be the instrument to reach as many people as possible, such as groups and governments.

Much work has been done in this regard, but there is an emerging need to implement effective education work tailored to the needs of each area of the world, each political regime, each social group, level of knowledge, cultural, economic and religious contexts, in the most distinctive features aimed at the protection and promotion of Human Rights, such as generating effective instruments to provide reporting of violations. The problem of investment in education (by governments and / or societies can be analyzed by Ignacio Ramonet who states that “we are witnessing a permanent tension between absolute sovereignty of consumption and citizens' desire for democratic guarantee”).³

In this context, there are different actors who have the responsibility to develop human rights education - International Organizations and States - political and political procedures; societal actions (in all dimensions) - individual action as social groups; pressure groups (identified or unknown) and the Media. The latter, in all communicational media, is one of the most important and powerful tools for building public opinion capable of

³ RAMONET, Ignacio. (1997) Geopolítica do caos. Rio de Janeiro: Editora Vozes. P. 139

developing social education. However, there are two views / action based on manipulation. There are the manipulated means and the manipulative means of your audience. This is a dangerous problem with serious and dangerous consequences for the violation of human rights. Despite all the influence groups that are in the genesis of the action of some media through images, discourse texts, diffusion of ideas and ideologies, there is a social education that promotes different "positions" tampered with by manipulation.

The control and formatting of information by the media has positive and negative consequences. Indeed, there are means that develop their work aimed at the proliferation of values and rights within the Laws, although all national, regional and / or international laws define and control their action. It can be said that there is too much manipulation that supports media action with consequences on human behavior that requires diagnosis, legal control and corrective actions, legal complaints and consequent punishment, and it is important that all that is incorrect and all legal actions and its consequences are, of course, published to the public knowledge. It is a measure of educational pedagogy for the perception of rights. There are influences and interests that hinder all this action of identification and denunciation; manipulation in the most diverse dimensions, but it is essential that there is a permanent state of "alert" to the details that can prevent any and all types of tampering. In many cases, it can be argued that this is not about the need for more legal support, but the implementation of the existing legal and judicial means for control and correction.

The United Nations has promoted education as a human rights priority, especially through UNESCO's actions. The International Labor Organization affirms Education as a priority in the international labor context, where there is still so much to change, implement and develop. The European Union has a priority in education, developing legislative procedures to protect and promote the human rights adopted as fundamental to the Organization, embedded in legal documents, especially in the Charter of Fundamental Rights of the European Union. The Arab League has adopted all United Nations international human rights legal documents, such as the Universal Declaration, formally incorporating them into the legal system of the Arab states. Generally speaking it can be said that the international legal system recognizes human rights with education as its mission. It is reiterated that there are states that have adopted and recognized these international instruments, in spite of the violation and violence, mostly, with no expected consequences due to their non-legal identification and, consequently, legal action, or even by ignorance. It turns out that education is not developed and allow serious violations without judgment or condemnation. The results are always the most negative for the victims and for human behavior, supported by false or manipulated information, generating discrimination, xenophobia, racism, violence and all human rights violations. The consequences are the most serious, such as human suffering, death and all dangerously misunderstood actions in the political, social, cultural and / or religious fields.

Consequently, the research emphasizes another important detail for this relevant context aiming at reinforcing the need for the development of a Human Rights Education: discourse and rhetoric. It is an unquestionable strategy, especially for communicational action, in the most diverse areas, where all the details are important, but which can generate ideas and behaviors based on adulterated information that result in attitudes involved in danger to human life. While on the one hand there are "innocent" (unplanned) rhetoric / discourse on formatting, but with the most serious and negative consequences, it can be said that most serious problems, discussions, misconceptions and formatted opinions, opposition behaviors, citizens, states and in a dimension of International Relations. Supported by manipulation-controlled actions or messages without explicit meaning to recipients, the results can and often are disastrous to us. In theory these are simple questions, but in practice it is important to identify all the details, construction, undeclared information, subliminal messages and disparate "images" generated from reality. After all, subliminal messages, ideas, and ideologies are more important than those that can be evidently visible. In the field of the Human Rights system this context of differentiated plans is so common that there are many studies and actions in favor of building the understanding of information / communication. Thus, the development of human rights education is more than a necessity or strategy, but an

emergent and urgent intervention directed at the important results for the protection of human beings. There is a lot of work to be done in this area regardless of all the complexity, with education tailored to the real needs to reach the largest number of people with effective understanding, interpretation and action in line with realities.

Conclusions

The research developed, which findings are presented in this article, achieve the main conclusions that validate the need to question and identify the theories and practices regarding human rights education within international policies. “Sustainable” political, cultural and social citizenship lives on the rhetoric that results in the facts that need educational intervention, social pedagogy and democratic politics.

To conclude, we can illustrate the ideas presented by analyzing some case studies based on the complex areas: culture, religion, refugees and terrorism. There are ideologies and ideas enveloped in latent danger by the way they are spread through the most diverse communication channels, such as within social relations, generating violence, discrimination, racism and xenophobia, such as the political positions and actions of governments or, for example, by the European Union.

The so-called refugee crisis in the world, and in Europe in particular, could have been treated differently, especially since the Arab Spring, by the preventive measures that should have been taken in the political, social and cultural spheres, can avoid massive uncontrolled human movement, with the most dramatic death statistics on the run. There is an undeniable need for urgent and emerging response through concerted action adapted to the real and dramatic situation of refugees, the European political power - the European Union and each state - stopping the human suffering of many thousands of people who are “lost” on the way. of the struggle for survival. It is humanly a catastrophe that has to be fought under penalty of having and being (in the democratic responsibility that assists all) colluding with such dimension of suffering and violation of Human Rights.

Despite all the policies, laws, legal and judicial regulations and consequent actions, the violation of values and rights is at the root of the serious problem associated: Public Opinion. Refugees are a topic everyone talks about but there is a huge lack of information and training. Education is a requirement in this field. And while there is freedom and the right to adopt positioning, in fact there are numerous important issues that affect common sense: those with legal information; those who fail to interpret due to international policies and politically conditioned behavior; those unaware of the escape-promoting origin contexts of origin for survival; those who do not have access to the actual numbers of deaths that occur in the seas, deserts, on the arduous road to “safe” countries; and one of the most serious issues, the subhuman conditions under which thousands of human beings live in refugee camps where solidarity is manifestly insufficient and political action falls short of their responsibilities.

Scientific research shows that human rights education is the most important base of support / “key” for democratic development in the most diverse social contexts and realities, promoting the necessary change through a bold and complex process, but possible. for the sake of humanity.

Informal learning in the educational process of IT professionals

Irina N. GOLITSYNA¹

¹*Kazan (Volga) Federal University, High School of Information Technologies and Intelligent Systems
Email: Irina.Golitsyna@gmail.com*

Abstract

One of the necessary professional competencies of IT professionals is the ability to permanent professional development that fits into the concept of lifelong learning. Informal learning becomes an important element of training in the traditional educational process of IT professionals. According to a students' poll, the most preferred forms of informal learning are: performance of specific activities and educational interaction in small groups. In the frameworks of the traditional educational process the students' educational activities have elements of personalization. Educational activities are personalized in sources of educational information, in forms and methods of training and self-directed learning outside a classroom, in the use of professional knowledge, including available via Internet. Activities of teachers change due to: continuous development of the subject areas and new forms of educational activities of students, emergence of new sources of educational information, formation of electronic information-educational environment (EIEE) of educational institutions and personal EIEE of students.

Keywords: lifelong learning, formal learning, informal learning, IT-professionals

Introduction

Organization of educational process of modern IT-specialists requires modern methods and forms of teaching and learning. Training of such specialists has following features:

- Professional activities of modern IT-specialists require constant professional adaptation to the development of information technologies.
- Forms and methods of training are developed according changes in informational educational environment.
- One of the necessary professional competencies of IT professionals is the ability for a permanent professional development that fits into the concept of lifelong learning.

Working definition of lifelong learning according to Memorandum on Lifelong Learning (2000) is: "lifelong learning must become the guiding principle for provision and participation across the full continuum of learning contexts."

According Oxford Handbook of Lifelong Learning (London, 2011), "people will need continually to enhance their knowledge and skills, in order to address immediate problems and to participate in a process of continuous vocational and professional development".

Lifelong learning includes formal, nonformal, and informal education and training.

In a World Bank Report (Lifelong Learning, 2003, p.3) formal education and training are defined as the including "structured programs that are recognized by the formal education system and lead to approved certificates". Nonformal education and training are defined as the including "structured programs that are not formally recognized by the national system". Informal education and training are defined as the including "unstructured learning, which can take place almost anywhere, including home, community or workplace. It includes unstructured on-the-job training".

The paper discusses elements of informal learning in the traditional educational process of students of bachelor programs 09.03.02 Information systems and technologies and 09.03.03 Applied Informatics. According Educational standards of higher education in Russian Federation (Portal, 2017) of this bachelor programs, graduates should be capable to "manage their time, build and implement a self-development trajectory based on the principles of lifelong education" (UK-6).

Method

We consider comparison between formal and informal learning in a number of important aspects. In order to determine what elements of the informal education are used by students in traditional educational process, we made a survey of students of bachelor program 09.03.02 Information systems and technologies and of bachelor program 09.03.03 Applied Informatics of Kazan Federal University. In this survey took part 96 students of 3rd and 4th years of study. From this survey we have considered such aspects, as sources of knowledge, forms of learning, personalization. As an example of teacher activity we discuss our experience on practical classes (Golitsyna, 2017a).

Discussion

Table 1 shows a comparison between formal and informal learning in the next important aspects: source of knowledge, personalization, monitoring and evaluation of results, activity of teachers, forms of teaching and teaching/ learning methods (Zakhar'yev, 2007).

Table 1. Comparison between formal and informal learning

	Formal learning	Informal learning
Source of knowledge	Teacher	Teachers guide to sources of knowledge. Creativity, practice, analysis and synthesis of knowledge are in a center of learning
Personalization	All students are engaged in a same educational activity	Students have individual training plans
Monitoring and evaluation of results	Curricula determine monitoring and evaluation of training results	The training plan depends on an individual students' abilities and preferences
Forms of learning	Traditional classes in academic groups	Training through specific activities
Teaching/ learning methods	Educational activities are mainly reproductive	Group training, people learning from each other
Activity of teachers	Teachers periodically improve their skills	Teachers should be involved in the process of lifelong learning

Sources of knowledge. According to students' poll, they actively use all available sources of educational information. Figure 1 shows students' answers to the question: "Where do you find educational content to prepare for classes?"

As we can see from the answers, students use summary of lectures or seminars and educational content recommended by a teacher as often as electronic educational resources: e-guides, electronic reference books, specialized forums. They use often Wikipedia; as noted by Selwyn & Gorard (2016), Wikipedia mainly plays an introductory and /or clarificatory role in students' information gathering and research. It should be noted that only 7% of students tend to search for literature in the university library.

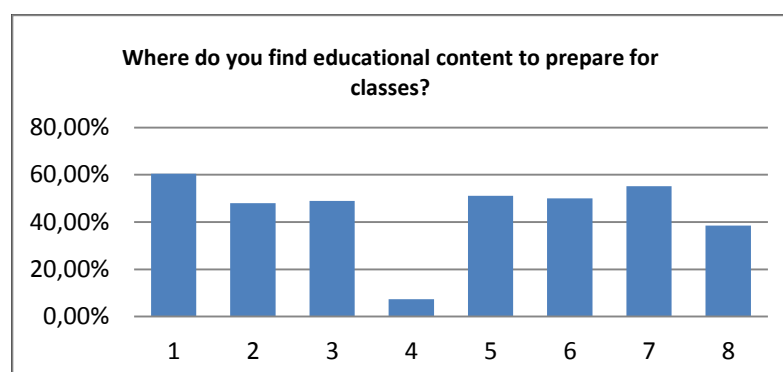

Figure 1. Students' answers to the question: "Where do you find educational content to prepare for classes?"

Answer options:

1. I use summary of lectures or seminars
2. I use an educational content recommended by a teacher
3. I discuss study questions with other students
4. I use resources of the university library
5. I read e-guides
6. I use electronic directories
7. I read articles on Wikipedia
8. I use specialized forums

Personalization. Personalization of the educational process is one of the world trends in the development of modern higher education (Burnyashov, 2017). While studying in academic groups according to a general curriculum, most of the students create personal EIEE (Golitsyna, 2017a). Application of web-resources and use of mobile devices facilitates infiltration of flexible learning technologies into a traditional educational process (Golitsyna, 2017b). In conditions of flexible learning, the teacher must assume the role of a guide and encourage students to autonomy and flexibility within the educational trajectory (Agudelo, Salinas, 2015). It creates additional opportunities for organization of independent work of students and provides personalization of training (Eminov, Golitsyna, 2017).

Students personalize educational process both in sources of educational information and in forms and methods of training and self-directed learning. According to a students' poll, 92% of students are actively in a self-directed learning, 70% independently use specialized books and textbooks for learning, 47% of respondents use forums for programming. Besides, students independently use educational online resources (27%) and professional forums (11.5%) for self-teaching, 21% of students attended full-time educational courses.

18% of respondents use social networks for self-teaching (Vkontakte, Instagram, Pinterest, pikabu); at this connection Çelebi et al. (2018) notice, that the use of the social network-based applications significantly improve students' academic achievement and "academicians should support students who are interested in new technology and communication applications to get updated information as a part of lifelong learning".

Besides students use following Internet resources for self-teaching: Cleverics (<https://cleverics.ru/>), Codecademy (<https://www.codecademy.com/>), Coursera (<https://www.coursera.org/>), CyberForum.ru (<http://www.cyberforum.ru/>), habr (<https://habr.com/>), htmlacademy (<https://htmlacademy.ru/>), INTUIT (<http://www.intuit.ru/>), Lingualeo (<http://lingualeo.com/ru/>), Medium (<https://medium.com/>), Netology (<https://netology.ru/>), PyDev (<http://www.pydev.org/>), Stack Overflow (<https://stackoverflow.com/>),

STARTANDROID (<https://startandroid.ru/ru/>), SOLOLEARN (<https://www.sololearn.com/>), Stepik (<https://welcome.stepik.org/ru/>), TutorOnline (<https://www.tutoronline.ru/>), Udacity (www.udacity.com), w3schools.com (<https://www.w3schools.com/>), Yandex Academy (<https://academy.yandex.ru/>).

Forms of learning. The diagram in Figure 2 shows students' answers to the question: “What forms of training do you prefer?” As we can see on a diagram, majority of the students prefer project work in a small group (72 %) and independent development of software applications (44%), while only 39% prefer traditional lectures and classroom workshops.

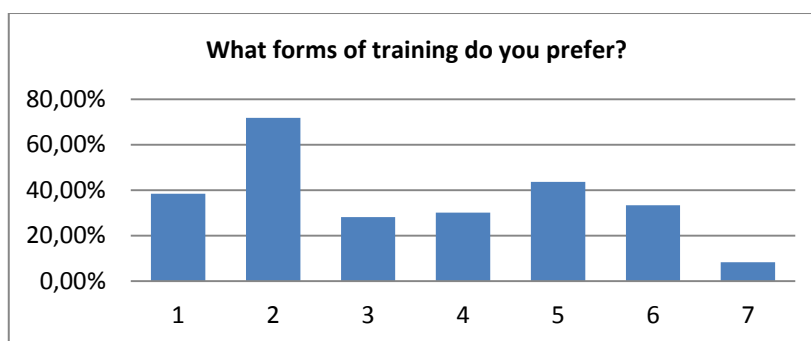

Figure 2. Students' answers to the question: “What forms of training do you prefer?”

Answer options:

1. Traditional lectures and classroom workshops
2. Project work in a small group
3. Independent work outside the classroom
4. Implementation of individual exercises
5. Independent development of software applications
6. Implementation of creative exercises
7. Other

Therefore, in the framework of traditional educational process students prefer forms of training relevant for an informal learning, such as implementation of specific learning activities and educational interaction in small groups.

The answers to the question “How do you solve problem tasks and creative exercises?” show, that students solve problem tasks and creative exercises independently (67%) or with the help of classmates (70%), but more often they use Internet resources (85%). They also use in that cases electronic textbooks (50%) and specialized forums (37%), and only 4% of students are trying to find literature in the university library.

Teachers' activities. Changes of teachers' activities occur due to the following factors (Golitsyna, 2017a):

- subject area of education is developing continuously;
- new sources of educational information are emerging;
- new forms of students educational activities are developing.

To ensure proper quality of modern professional training, teachers have to constantly update educational content. In order to do this, they use various approaches, such as:

- regular updates of study-books and manuals;
- development of electronic educational resources based on specialized systems and web-resources;

- use of professional software products, including those available on the Internet;
- development of own software-environments for teaching, including these based on mobile technologies.

On our practical classes were used following forms of educational activity:

- Guidelines were prepared, brief theoretical information on topics was given and hands-on assignments and exercises for solving problems for each practice session were handed to the students.
- Students were free to choose software environment and tools for problem solving.
- Control of the results was conducted through personal talks with students about themes of practical classes.

This form of training and teaching of classes allowed to:

- Choose and use the most methodically reasonable educational resources for studying each topic of a discipline.
- Arrange personal conversation with every student, while responsibility of the students was to be prepared and answer all the questions on a topic of a class.
- Let students freely choose methods and means of problem solving and managing of practical tasks. As a result students' independent practical work was personified.

Results, Conclusions and Recommendations

We can conclude that traditional educational process of IT specialists includes elements of informal learning in the following aspects (Golitsyna, 2018b):

Source of knowledge. Teachers' role as a main source of knowledge decreases, students actively use all available sources of educational information. At the same time role of traditional informational infrastructure of educational institution is significantly reduced, in particular, we see that our students rarely use the university library.

Personalization. In addition to the fact that all university students belong to official academical classes, they actively form personally-oriented EIEE. They introduce elements of personalization both into educational information sources and forms and methods of education and self-directed learning.

Teaching - learning methods. Being in a framework of traditional educational process, students clearly prefer forms of study that are more common for informal learning: implementation of specific activities and educational interaction in small groups.

Activities of teachers are also changing. That happens due to the four following factors: continuous development of the subject area of education, appearance of new sources of educational content, development of new forms of educational activities and formation of EIEE.

As a result we can recommend implementation of following activities for teachers:

- participation in continuous development of EIEE according modern educational standards;
- continuous update of the educational content of disciplines, that should include the interdisciplinary educational content (Eminov et al., 2018);
- update of the teaching-learning methods according to condition of professional environment of IT-specialists.

Teacher Candidates' Views on Effectiveness, Managerial Effectiveness and Mobbing

Sibel GÜVEN¹

¹Assoc. Prof. Dr. Çanakkale Onsekiz Mart University, Faculty of Education, Primary Education Department
Email: s_guven@comu.edu.tr

Abstract

This study aims to determine the opinions of the 3rd and 4th year university students at school of education about the meaning of the concepts of effectiveness, managerial effectiveness and mobbing, and whether the students were exposed to mobbing by the instructors during their undergraduate education. Qualitative method was used in the research. The study group consists of 50 teacher candidates (37 females and 13 males) in Çanakkale Onsekiz Mart University, Faculty of Education in the academic year 2018-2019. In the study, semi-structured interview form was used as data collection tool. The content analysis technique was applied in the analysis of the interview questions. The coding results for the definitions of effectiveness, managerial effectiveness and mobbing, their faculty members' status of applying to mobbing and in which ways, and also the teacher candidates' mobbing experiences were presented with frequency distribution.

Keywords: Effectiveness, managerial effectiveness, mobbing, teacher candidates

Introduction

Human beings leaving behind the 20th century expect huge changes in the 21st century. Education is an important phenomenon since well-educated people are advantageous to catch up with the change and sustain it. At this point, teachers affect two important factors which are well-educated society and education. In order to train qualified teachers, it is required to have school of education with dynamic organizational culture. School of education is one of the organizational branches at university whose tasks are to conduct scientific research, teach and give social service. Because of its role that school of education is the institution training future teachers, they must be in base of a sustainable improvement. This improvement enables faculty of education to be effective provided that to have successful administrators ensuring managerial effectiveness, and to have a faculty involving in decision making process.

Effectiveness is closely related to if an organization is able to reach its organizational purposes (Karshi, 2004). If an action serves for its desired aim, then it can be said that the organization works effectively (Bernard, 1966). Effective organizations are also required to be managed efficiently. Therefore, the concept of managerial effectiveness based on administrator competence. Managerial effectiveness is a concept refers to the consequence of administrator's behaviors and what they accomplished (Karatepe, 2005, Cammock, Niakant & Dakin, 1995). Managerial effectiveness can happen through different methods in various organizations. Since educational organizations deal with people-related issues, it brings several problems to the table. One of the biggest issues is mobbing.

In the related literature, it is difficult to find a single expression referring to the concept of 'mobbing'. It is generally used as 'mobbing' in Scandinavian countries such as Sweden, Norway and Finland as well as 'bullying' word is used commonly in England, Canada and the U.S. (Einarsen, 2000). In Turkey, to express the 'mobbing' concept there are several phrases used such as "psychological lynch in workplace", "psychological abuse in workplace", "psychological terror in workplace", "intimidation (yıldırma)", "emotional attack in workplace", "workplace trauma", "emotional abuse", and "violence (zorbalık)" (Çobanoğlu, 2005). The study of "workplace mobbing" began with Dr. Heinz Leymann, a renowned psychologist and professor in the early 1980s.

Mobbing, which is defined as discomforting, galling and adverse behaviours directed systematically at one individual by one or more individuals in the workplace (Cowie, Naylor, Rivers, Smith, & Pereira, 2002) is prevalent in health, education and defense oriented organizations (Farrington, 2010). Mobbing is explained as a psychological terror, emotional attack or being against to something or someone (Yüçetürk, 2002). And also mobbing is a psychosocial risk that consequently leads to “burnout” and “negative actions” between members of an organization (Arnejcic, 2016). Academics and students at university have the right of thinking, feeling and speaking in appropriate way of human values (Bradley, 2009). For this reason, they should be able to express their views and feelings freely. However, research in the literature show that mobbing culture is seen mostly at universities and university campuses (Whesteus, 2007). Regarding this, there are many research conducted with administrators and academics as well (Raskauskas, 2006, Boynton, 2005, Caborar and Rodriguez, 2006). On the other hand, there is no research carried out with university students who are an important component in the body of university. Therefore, this study aims to determine the views of teacher candidates related to the concepts of effectiveness, managerial effectiveness and mobbing. With this aim, the following questions were addressed:

Of the teacher candidates,

- What do they think about effectiveness?
- What do they think about managerial effectiveness?
- What do they think about mobbing?
- What do they think about if their instructors apply mobbing at the faculty?
- What do they think about how the instructors use mobbing at the faculty?
- What do they think about mobbing if they have witnessed any mobbing case?

Method

Research Design

This study follows qualitative research method. Qualitative methods enable researchers to be subjective and flexible during the research process and this gives chance to a researcher to reproduce the research process and to analyze data based on inductive approach (Yıldırım&Şimşek, 2011; Creswell, 2013).

Study Group

The study group consists of 50 teacher candidates (37 females and 13 males) in Çanakkale Onsekiz Mart University, School of Education at the academic year 2018-2019.

Data Collection Tool

In the study, semi-structured interview form was used as data collection tool. The questions of form are determined according to the related literature based on the purpose of the study. The following questions were asked to the participants:

1. How do you define ‘effectiveness’?
2. How do you define ‘managerial effectiveness’?
3. How do you define ‘mobbing’?
4. Do you think the instructors at your faculty apply mobbing? If yes, how?
5. Have you ever witnessed any mobbing case during your teacher training period at the university?

Reliability and Validity

The validity of the questions was determined by Lawshe’s (1975) ‘content validity rate’. In this analysis, the experts review the expressions in interview form and evaluate them as appropriate, may remain or inappropriate. Each ‘appropriate’ answer determines the total coefficient to be reached. In this study, totally 5 experts evaluated

the interview questions, in which one is from Turkish Education, three are from Educational Administration and one is from Assessment and Evaluation Department. The table below shows the content validity results.

Table 1. Content validity results

Interview questions	appropriate	may remain	inappropriate	content validity rate (p)
1	5	0	0	1
2	5	0	0	1
3	5	0	0	1
4	5	0	0	1
5	5	0	0	1
content validity index				1,00

As a result of coding process by three expert academics, the reliability of the study was measured according to Miles and Huberman's reliability formula and it was found as 91%.

Analysis Techniques

Content analysis technique was applied during the data analysis process. First, interview forms were numbered. Then each participant's answers were coded and frequency distributions were added. The codes were categorized under effectiveness, managerial effectiveness, mobbing, mobbing using situation of the university instructors and the way of their using mobbing, and being witnessed of mobbing. The quotations were elaborated for each category by stating the participant number and gender in parenthesis. In addition, the total frequencies are more than the number of the participant because one participant could state multiple views in the same questions.

Findings

The findings obtained from the data analysis of the research are given below. In the research, the opinions of the teacher candidates about effectiveness have been handled and given in Table 2 together with their frequency.

Table 2. Teacher candidates' views on effectiveness

Effectiveness	f
Taking teacher as a role model	2
Educational activities	2
Using communication ways successfully	5
Ensuring validity	4
Make it interesting	2
Being active, being different and providing permanence	14
Interaction with people	1
Have the power without rules	3
Can chance people	5
Achieving purpose	2
Impact	2
Total	42

In Table 2, teacher candidates' opinions about effectiveness are given. Teacher candidates defined effectiveness in different ways. Definition with highest frequency is "being active, being different and providing permanence". Some examples of teacher candidates are below:

- “The state of making an object, a phenomenon, situation or person more attractive” (S6, M)
- “To influence other people and convince them about yourself using your opinions and other factors.” (S16, F)
- “To have the power in a place by using rules and being objective” (S16, F)
- “The level of reaching pre-determined purposes” (S23, F)
- “The degree of reaching purposes. To what extent you reach your aim, you are such effective. The situation of being effective is effectiveness.” (S27, F)

For second research question, the participant teacher candidates were asked about their views on managerial effectiveness. The results for their answers were given on Table 3 below;

Table 3. Teacher candidates’ views on managerial effectiveness

Managerial effectiveness	f
Being successful in management	10
Making good decisions	4
Making interest	1
Holding power in management	7
Coordination and cooperation in management	3
Equipped and consistent behavior	4
Maximum efficiency received	2
Do the best job	2
Total	33

In Table 3, teacher candidates’ opinions about managerial effectiveness are given. They defined managerial effectiveness in different ways. Definition with the highest frequency is “being successful in management”. Some examples of teacher candidates are below:

- “To make the management more interesting” (S5, M)
- “To have the power in management” (S6, M)
- “To provide coordination and cooperation by reducing the problems to minimum” (S12, M)
- “To perform leadership behaviors and to be modest” (S13, F)
- “To have your students/workers perform in the highest efficiency level” (S13, F)
- “To fulfill your tasks required for your status and to be active” (S47, F)

Another question asked to the participants were about mobbing concept and Table 4 below shows the analysis results related to the views of the teacher candidates about mobbing.

Table 4. Teachers' candidates views on mobbing

Mobbing	f
Repression	6
Emotional pressure	9
Disturbing, intimidating	18
Bullying	13
Threatening with marks	2
Exclude	1
Remain under stress	2
Verbal violence	3

Total 54

In Table 4, teacher candidates' opinions about mobbing are given. They defined mobbing in different ways. The highest frequency belongs to "disturbing, intimidating and bullying". Some examples of teacher candidates are below:

- "To suppress a person in verbal manner – mobbing" (S42, M)
- "To make people demoralize and underperform by putting psychological pressure on them" (S1, F)
- "To put pressure on people emotionally and to apply demoralize policy through their goals" (S2, M)
- "To drag people into emotional chaos verbally" (S7, M)
- "To act disturbing behaviors for other people" (S13, F)
- "To blackmail to get a job done; for example, a teacher blackmail students with grades" (S14, F)
- "For teachers, to threaten students with grades" (S17, F)
- "To exclude definite persons by other organized people in a workplace and to ignore them by not valuing" (S26, F)

As the fifth question, the participants were asked whether the university instructors apply to mobbing and if yes, how they apply to mobbing. The results with frequency distribution are given below in Table 5.

Table 5. Teacher candidates' views on the use or not of mobbing by instructors

	f
Use	34
printing with political	4
threat with grades and homework	8
emotional pressure	5
psychological pressure	6
overawe from lessons	7
humiliation-insulting	3
threatening with absenteeism	1
not use	16
Total	50

Table 5 shows the frequency distribution in terms of whether the university instructors apply to mobbing and how they do it. The results show that the participant teacher candidates think that the university instructors apply to mobbing. The teacher candidates mentioned several ways of mobbing about how the university instructors apply to mobbing. The ways of applying mobbing with the highest frequency are to overawe from lessons, to put on psychological pressure, and to threat students with grades and homework. Some example quotations from the participants are in the following:

- "I think, some of them apply to mobbing. They want to impose their thoughts and views on students and also they prevent the opponent views by suppressing them to be silent." (S49, F)
- "Yes, they do. They threat students with grades and overawe from lessons." (S48, F)
- "Yes, they do. They make threatening sentences related to grades and absenteeism." (S46, F)
- "Some of them do it. By humiliating or insulting in terms of knowledge level" (S27, F)
- "Yes, they do. They frustrate students about lessons. They are the behaviors performed by a teacher without purposefulness, instead for their ego satisfaction." (S22, F)
- "Yes. Especially the ones bother who do it over political issues." (S6, M)

Final question of the study was if the participant teacher candidates have witnessed any mobbing case ever. The results were given at Table 6.

Table 6. Teacher candidate's views on witnessing mobbing or not

	f
I witnessed mobbing	22
I have never witnessed mobbing	28
Total	50

Table 6 reveals the results about the situation whether the teacher candidates have ever witnessed any mobbing case. According to the results, 22 of the participants have witnessed a mobbing case as well as 28 of them have not witnessed any mobbing case before. Some quotations from the participants' views are in the followings:

"Because of differentiating opinion between the instructor and my classmate, the instructor did not let my classmate to talk in classroom." (S10, F)

"The audience's verbal abusing during the presentation made my classmate felt under pressure emotionally." (S14, F)

"Yes, I have been threatened with overawing from the lesson." (S17, F)

"It happened at high school. The teacher was asking difficult questions to a student with whom s/he argued." (S24, M)

"I witnessed. I have been threatened by some instructors at university in terms of grades." (S29, F)

"Yes, I did. An instructor applied it by threatening students with overawing from lesson to get a job done." (S32, F)

"I witnessed that they insulted views of students." (S42, M)

Conclusion and Recommendations

This study examines the views of teacher candidates related to the concepts of effectiveness, managerial effectiveness and mobbing as well as their views on whether the instructors apply to mobbing, the ways of applying to mobbing and their experiences with mobbing. According to the study results, the teacher candidates defined effectiveness in different words such as being active, being different and providing persistence, reaching to purposes, and acting communicating skills successfully. These definitions made by the teacher candidates show similarity with those in the literature. For example, Homgren et al. (2000) defines that effectiveness is the performance aspect which determines to what extent an organization reach its goals as a result of its activities. In addition, Karşlı (2004) states that effectiveness is the level of reaching goals for an organization. An organization's accomplishing its purpose is based on cooperation among organization members, their communication and commitment with the organizational goals. All of these factors make an organization effective.

As a second important result of the study, the teacher candidates defined managerial effectiveness as being successful in management and having power in management. Reddin (1970) stated that managerial effectiveness is to produce outcomes conforming to managerial position of an administrator. Besides, Karatepe (2005) stated the aspects of managerial effectiveness which are communication, planning and organization, decision making, problem solving, interest in the personnel, being creative/innovative, team working, and honesty/trustworthiness. To perform well in terms of all these aspects requires being a successful manager. Thus, an organization's managerial effectiveness is based on the manager's performance. The more qualified and competent manager an organization has, the more effective it is effective (İra & Şahin, 2010).

Regarding the mobbing concept from the point of views of the teacher candidates, they defined mobbing in different ways: bothering, intimidation and violence/bullying. There is similarity with these definitions with the literature. For instance, Çobanoğlu (2005), Tınaz (2008), Leyman (1990) and Whestus (2006) stated in their definitions that mobbing is psychological terror, psychological abuse in workplace, emotional attack in workplace, intimidation (yıldırma), violence/bullying (zorbalık). Further, Tigrel and Kokolan (2009) emphasized the phrases of psychological violence, pressure, bullying and abuse to refer mobbing in Turkish context. Those definitions show similarity with the ones in this study. Moreover, teacher candidates stated that the instructors at university applied to mobbing by putting emotional and psychological pressure on students, and threatening students with grades and homework. In addition, most of the teacher candidates mentioned that they witnessed mobbing cases during their education at university. In the literature, the studies also revealed that mobbing cases were faced mostly at universities (Gül, İnce&Özcan, 2011; Yaman, 2007; Amejicic, 2016).

The following recommendations were put forth based on the study results:

- For further research, studies seek for the views of faculty members might be conducted. Teacher candidates' approaches and judgments may change throughout their educational period. Thus, faculty members might be asked directly if they apply to mobbing as well.
- Experimental research might be designed to study different environments to increase managerial effectiveness and to work together in cooperation between administration and personnel.

Abstract

(1) Background: Green value chain practices mean that businesses create value in order to create sustainable competitive advantage at different stages from the design of their products to the after-sales services. At this point, while creating value is of strategic importance, the focus of all activities is to minimize environmental impacts and pollution, to protect the environment and even to make proactive arrangements if possible. In this study, the relationship between green value chain applications and business performance, which is a tool based on ensuring sustainability of enterprises, is investigated. (2) Methods: The hypothesized relationship of this model tested with data collected from 175 manufacturing firms by using SPSS and simple regression analysis. (3) Results: Green value chain applications; examined as green basic activities and green support activities, business performance is also considered as economic and socio-ecological performance in two dimensions. In the research, it has been found that green value chain applications positively affect the economic and socio-ecological performance of enterprises, but the power of this effect is relatively weak. (4) Conclusions: In order to provide competitive advantage, enterprises create value at the rate they create. Green value chain applications, which are a means of creating value in enterprises, have an impact on the performance of the enterprise. Many implications indicated by the study's findings, both theoretical and practical, were discussed.

Keywords: Green value chain applications, business performance, sustainability, economic performance, socio-ecological performance

Introduction

In order to sustain their assets and increase their profitability and productivity, enterprises have a structure that affects their environment positively or negatively as well as affected by the environment. Although the size of the interaction varies from business to business, the negative impact of the interaction with the environment and the resulting outcome have been effective in the society for the last fifteen years, in making ecological (environmental) problems the most important and priority social interest in enterprises at the strategic level Akatay and Aslan [1]. In particular, the enterprises that are the greatest creators of environmental pollution have to act environmentally sensitive within the scope of legal regulations.

Sustainability, environmental awareness and developing environmental management practices in this context are very useful but also difficult to achieve activities. These practices, which can also be referred to as environmental management practices, take place in a wide range from the purchase of raw materials to the disposal of the product (purchase, production, marketing, waste management...). At this stage, enterprises benefit from techniques that can guide environmental management such as green value chain applications. Green value chain practices mean that businesses create value in order to create sustainable competitive advantage at different stages from the design of their products to the after-sales services. At this point, while creating value is of strategic importance, the focus of all activities is to minimize environmental impacts and pollution, to protect the environment and even to make proactive arrangements if possible Aykan and Sevim [2].

In academic studies focusing on environmental issues, there are few studies Gupta [3]; Starik and Rands [4]; Shrivastava [5]; Hart [6]; Tan [7]; Gonzeles-Benito [8]; Cater et al [9]; Yuliharsi and Jin [10]; Aykan and Sevim

[2], based on the testable hypotheses of the place of environmental management in the value chain and the effect of environmental concerns on the performance of enterprises

is determined that environmental management practices and activities (which can be expressed as environmentally sensitive management, environmental management, ecological management or green management) are related to the performances of enterprises. The performances of the enterprises are mostly economic such as product quality, efficiency and productivity, sales, profit margins increase, cost savings, new market opportunities or increase in market share; It has been evaluated within the framework of socio-ecological performance criteria such as decrease in environmental complaints related to products, decreases in waste and emission amount, increases in recycling practices, increase in business image and social cohesion. In this context, it is assumed that there may be a positive relationship between green value chain practices and economic and socio-ecological performance of enterprises in order to provide sustainable competitive advantage. From this point of view, the aim of this study is to determine the effect of green value chain applications on the performance of enterprises. In this study, first of all, green value chain and business performance concepts will be explained briefly and research findings will be included within the framework of developed model.

Literature Review

Green value chain

The concept of Value Chain was first defined by Porter [11], as the evaluation of nine general activities that create value in enterprises in order to gain competitive advantage. However, Handfield et al.[12], stated that the value chain is evaluated as a whole of different activities such as design, supply, logistics, assembly, production, marketing, sales and after-sales service applied throughout the life of the product. The green value chain includes the addition of a new dimension of environment to the traditional value chain Solvang et al. [13]. In this context, the green value chain refers to the evaluation of activities that create value by considering the natural resources and environment in the basic functions of the enterprise with a holistic and sustainability perspective. The green value chain is used as a means of revealing the advantages and weaknesses of the company's activities through ecological evaluation. According to Akdogan [14] the main importance of this tool is to evaluate the business as a whole and not only to popular marketing and advertising issues, but also to determine the situation within the scope of environmental sensitivity.

In the literature, green value chain applications have been examined from different perspectives. The most widely accepted of these perspectives is Porter's [11], value chain analysis, developed within the scope of basic and auxiliary activities Saha and Darnton [15] ; Ndubisi and Nair [16]. Solvang et al. [13] evaluated the value chain practices within the framework of waste reduction approaches in the process ranging from suppliers to consumers. Sitkin [17], evaluated the green value chain functions within the scope of upstream (sourcing and production) and downstream (packaging and logistics) activities, (2013). Table 1 summarizes the green value chain practices within the framework of core activities and support activities (internal support activities, external support activities) Aykan [2] .

Table 1. Green Value Chain

Internal Support Activities	Primary Activities				External Support Activities	Economic Conditions
	Green Operations	Green Logistics	Green Marketing and Sales	Green Services		
Green Infrastructure Development	Recyclable packaging	Transport impacts, transportation	Raw materials, supply	Receipt and environmental disposal of		

		and storage modes		used products	
Green Technology	Pollution minimization and control, energy efficiency	Waste management, alternative energy sources	Packaging reduction	Restorations and improvements	NGOSs
Green Human Resource Management	Corporate environmental awareness, corporate culture, training programs	Contracts, supplier selection, staff selection	Internal and external communication, community liaison	Incentives, rewards for green ideas and practices	State
Green Regulations/ Management Systems	“Just-in-time” processes	Recyclability	Green product development, green product supply	Environmental standards	Government Policies

Source: Aykan, 2013, (Adapted from Saha, M., G. Darnton, 2005 and Ndubisi, N. O., S.R. Nair, 2009).

Economic theories and models have led enterprises to maximum profitability rather than sustainability in the long run. However, Gauthier [18] according to environmental adversity and accidents forced businesses to act in accordance with the sustainability principles in environmental issues. Akdoğan [14], green value chain implementations are considered as a tool for adopting the approach of going from cradle to grave pollution which means killing the pollution before the birth in the enterprises. Green value chain practices, which are expressed as a means of ensuring ecological sustainability, are composed of basic activities and support activities. While the main activities are handled in four dimensions as green logistic, green operations, green marketing and sales and green services, support activities are examined in two groups as internal and external.

Business performance

According to Bingöl [19], performance refers to the level of efficiency of a job or the behavior of an employee or the results obtained by performing an assigned job within a certain period of time. Business performance includes the actual output or results of an organization. Performance criteria in enterprises enable businesses to focus on areas that require attention. The aim here is to improve by evaluating how well the work is done in terms of cost, quality and time, and to survive by responding to world-class competitive pressure, for Skrinjar et al. [20].

Different methods are recommended for performance measurement in enterprises. The most widely used and widely accepted quantitative financial indicators and methods Venkatraman and Ramanujam [21]. However, Maskell [22] stated that financial indicators are not sufficient for measuring business performance, and that qualitative indicators such as customer service and satisfaction, product quality, learning and innovation according to Kaplan and Norton [23]; Neely [24]; Neely et al. [25], should be evaluated. Hult et al [26] emphasize the need for financial, operational and organizational performance measures for business performance measurement.

In the literature, another approach to determine business performance based on cost-benefit relationship is ecological-economic performance according to Schaltegger and Synnestvedt [27]; Orlitzky et al [28]; Boons and Wagner [29]. Gandhi et al. [30] (2006), suggested that greening of value chain will finally lead to future sustainability with formation of win-win collaboration with regulatory, community and consumers. These practices try to minimize the damages to the environment in enterprises, respond to the demands of green consumers and eco-efficient products gain importance. These results provide sustainable competitive advantage for businesses. According to Annunziata et al [31], performance criteria for creating sustainable competitive advantage through green value chain analysis can be analyzed as financial, social and ecological performance.

As well as by Cater et al.[9] reported that they may be examined under financial and non-financial performance or economical and socio-ecological performance [32].

Economic performance: Extant literatures showed that sustainable competitive advantage via green value chain initiatives can lead to superior marketplace performance which can be measured in conventional terms such as market share, customer satisfaction etc., and financial performance such as return in investment shareholder wealth creation, profitability etc. Bharadwaj et al.[33]; Cagno et al. [34]; Cater et al. [9].

Socio-environmental performance: Also the nonfinancial performance socio-environmental performance of a company is indicated by indicators such as acquired environmental standards, improved customer loyalty, greater satisfaction of employees etc. and can only be achieved by implementing a systematic approach to setting environmental objectives and targets Cater et al.[9] . GVCi will also lead to cleaner, greener, and much more efficient operations, better environmental performance with reducing damages to the latter, besides overall improvement of the company's image. According to Yulihashi and Jin[10] these environmental benefits enjoyed therefrom are believed will spill over to general public and thus, will improve the social performance. In short, green value chain practices aim to achieve more sustainable development with business image, sales, market share and profit growth.

Methodology

Purpose of the research

Achieving sustainable competitive advantage, which is defined as the application of a value-creating strategy that cannot be implemented at the same time by its current or potential competitors and whose benefits cannot be copied Barney [35], has become the priority of enterprises today. Green value chain practices are used as a useful tool for environmentally conscious countries, businesses and employees in providing competitive advantage. In this context, it is assumed that there may be a positive relationship between green value chain practices and economic and socio-ecological performance of enterprises in order to provide sustainable competitive advantage. From this point of view, the aim of this study is to determine the relationship between green value chain applications and business performance of enterprises; The aim of the study is to determine the impact of green value chain implementation dimensions, green basic and green support activities, on economic and socio-ecological performances, which are the dimensions of enterprise performance.

Data collection

The population of the research is an important trade center in Turkey, where there is cutthroat competition; the manufacturing industry is composed of businesses operating in the Kayseri Organized Industrial Zone. The main group consists of 390 manufacturing industry enterprises of medium and large size (employing more than 50 personnel) among the 940 enterprises listed in the company list of Kayseri Organized Industrial Zone. The research data were collected through a questionnaire applied to the managers of the quality department of the identified enterprises or department managers responsible for environmental applications. 175 of these enterprises received responses and the return rate was calculated as 44.87%.

The questionnaire, which was created to collect data, consists of three parts. In the first part, there are 10 questions about the manager and the enterprise that completed the questionnaire, in the second part there are 23 statements to determine the value chain applications of enterprises and 17 statements to measure the performance of the enterprises. The scales used in the study are as follows:

Green value chain practices: It was developed by Yang et al.[36] on a 5-point Likert scale, and product designs and measured by 23 statements like, "plans in our company were tried to be environment-oriented". In the scale 1 means "strongly disagree", 5 means "strongly agree".

Business performance: It was measured by 17 expressions, which were developed by Rao and Holt [37], like “productivity increased after green value chain applications in our business”. Reliability of the scale, Cronbach’s Alpha Value was calculated as 0.941. In the scale 1 means “strongly disagree” and “5 strongly agree”.

Research model

In the literature, it is stated that green management practices have positive results such as clean and green practices, improvement and development in processes, profitability, competitive advantage in products and services, growth in market share, business image, improvement in management systems, customer service and satisfaction, product quality, learning and innovation (Kaplan and Norton [23]; Neely et al.[25]; Saha, Darnton [15]; Tan [7]; Ndubisi and Nair [16]; Cater et al.[9]; Çabuk et al. [38]; Tan and Zailani [39]; Silpthep [40] ; Yulishasri and Jin [10]). However, According to Tan [7]; Tan and Zailani [39]; Silpthep [40]; Yulishasri and Jin [10]; Annunziata et al. [31], the results of the green value chain applications are mostly evaluated within the framework of sustainable competitive advantage and social responsibility of enterprises While economic or financial performance constitutes the competitive advantage dimension of green value chain applications, non-financial or socio-ecological performance is evaluated within the scope of social responsibility of enterprises. In this context, the following hypotheses were developed:

Hypothesis 1 (H₁): There is a significant and positive relationship between green value chain applications and business performance in enterprises.

Hypothesis 2 (H₂): Green core activities positively affect the economic performance of enterprises.

Hypothesis 3 (H₃): Green core activities positively affect the socio-ecological performance of enterprises.

Hypothesis 4 (H₄): Support activities positively affect the economic performance of enterprises.

Hypothesis 5 (H₅): Support activities positively affect the socio-ecological performance of enterprises.

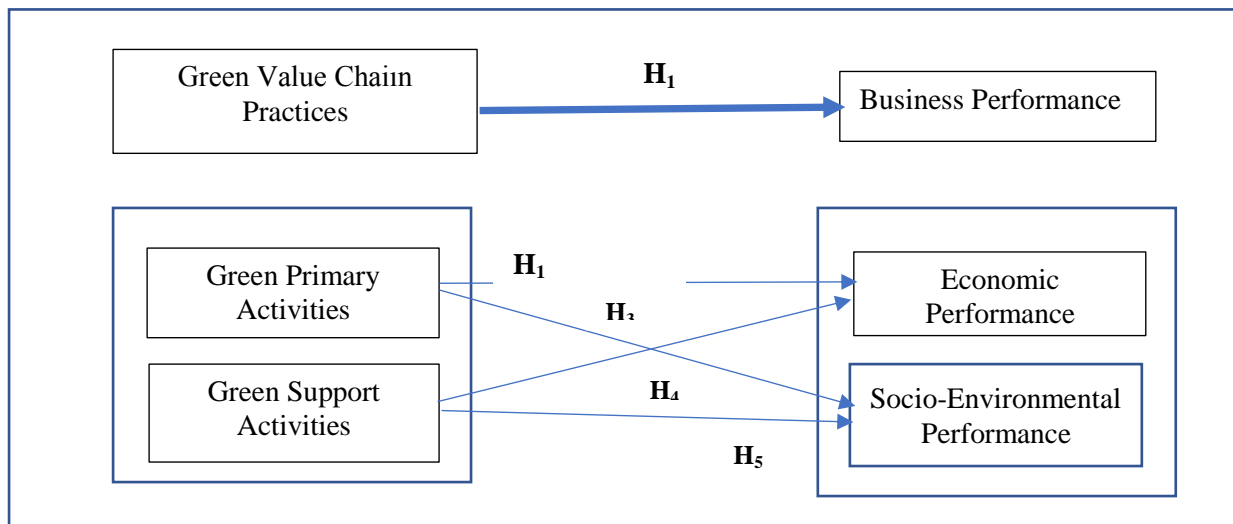

Figure 1. Research Model

Data analysis

The data obtained from the study were entered into the electronic environment using statistical package program and statistical analyzes were performed. Kolmogorov-Smirnov (n> 50) test was performed to prove the normality of the distribution. In addition, kurtosis-skewness values (+ 1.5 / -1.5) were found to be in the range. The data were normally distributed and parametric tests were used. The reliability of the scales was calculated using Cronbach’s Alpha Value. In order to test the construct validity of the scales, exploratory Factor Analysis was conducted, and whether the previously defined structure was confirmed in the new sample group due to the

change in the sample property was examined with the Confirmatory Factor Analysis (CFA) and the fit indices were determined. The relationships between dependent and independent variables were determined by calculating Pearson Correlation Coefficient (H1). Simple regression analysis was used to determine the effect of independent variable on the dependent variable (H2, H3, H4, H5).

Findings

This section presents the findings for research analysis. Firstly, the demographic data for the managers and their businesses are included and then the results of the analysis to test the hypotheses are explained.

The main mass of the research consists of manufacturing industry enterprises operating in Kayseri Organized Industrial Zone. The main group consists of 390 manufacturing industry enterprises of medium and large size (employing more than 50 personnel) among the 940 enterprises listed in the company list of Kayseri Organized Industrial Zone. The research data were collected through a questionnaire applied to the managers of the quality department of the identified enterprises or department managers responsible for environmental applications. 175 of these enterprises received responses and the return rate was calculated as 44.87%.

Demographic features

70.1% of the participants were under the age of 40, 19.4% were in the 31-40 age range and 6.9% were in the 41-50 age range. 2.9% are 51 years or older. 89.1% of the participants were male. It is seen that 113 of the 175 participants who participated in the study received undergraduate and higher education. 13.1% of the enterprises employed by the participants had 50-100 employees, 8% had 101-200 employees and 78.9% had more than 201 employees.

Validity and reliability findings

Cronbach Alpha Coefficient was used for reliability analysis of the scales. The reliability of the green value chain applications scale was calculated as Cronbach's Alpha Value of 0.934 and the reliability of the enterprise performance scale as 0.941. The fact that this coefficient is above 0.90 indicates that the scale is reliable.

Factor analysis for the green value chain practices and business performance

Table 2. Factor Analysis for the Green Value Chain Practices

Variables	Statements	Factor Loading	Factor Validity	Factor Variance
Green Base Activies	In our company, the environmental impact of materials and processes is reduced and environmental requirements are met.	.855	.901	35.03
	Product designs and plans are made to focus on the environment.	.851		
	When planning products and processes, recycling and utilization opportunities are evaluated.	.764		
	Compliance of materials and suppliers with regard to environmental regulations is evaluated in our company.	.742		
	In our company, green products are classified and stored in different places than other products.	.716		
	Quality control is carried out in an environment-oriented manner.	.706		
	Serious environmental protection measures are taken in our facility.	.694		
	Energy and resource savings are made in our facility.	.679		
	Reduction, control, reuse and / or recycling of emissions, wastes in processes is carried out in our facility.	.675		
	Green products are labeled, and information is monitored and reviewed.	.655		
	Green products can be shaped according to external	.639		

Green Support Activities	demands.			
	Environmental requirements, regulation and legislation provisions are taken into consideration in our business and are understood.	.780	.803	21.89
	Our company shares environmental results and records with the public.	.729		
	In our company, trainings are provided for employees on environmental protection.	.696		
	In our company, corrective and protective activities are being established about the environment.	.687		
	Process and equipment adjustments are recorded.	.671		
	The provisions of environmental regulation and legislation are periodically reviewed.	.661		
	A department responsible for the management and control of environmental wastes and emissions has been established in our facility.	.592		
	KMO= 0.884 p=0.00	Total Variance=56.925		

In the explanatory factor analysis, it is desirable that the factor loadings are 0.50 and above for the variables under the factors for Nunnally [41]. It was found that the factor loads of 23 variables related to the total two dimensions in Table 2 ranged from 0.592 to 0.855, thus satisfying the desired condition. KMO, which is the sample adequacy coefficient, is 0.88. Therefore, it is seen that the data structure of the research is suitable for factor analysis. As a result of factor analysis performed with Varimax rotation, Table 2 shows that the scale is collected under two factors in accordance with the original form. Factor names are given as; green basic activities and green support activities. The cumulative total variance explanation ratio of both factors is 56.93%, which is above the acceptable value of 50%.

Table 3. Factor Analysis for the Business Performance

Variables	Statements	Factor Loading	Factor Validity	Factor Variance
Socio-Environmental Performance	Environmental protection and environmental awareness have increased in our business.	.852	.906	33.21
	Recycling practices have increased in our company.	.779		
	The environmental image of our business has increased.	.775		
	Solid / liquid wastes are reduced in our facility.	.755		
	Social commitment has increased in our business.	.721		
	The efficiency of our business has increased.	.716		
	Environmental complaints made to our business have decreased.	.709		
	Emissions have been reduced in our facility.	.628		
Economic Performance	The profit margin of our business has increased.	.845	.872	27.18
	The market share of our business has increased.	.811		
	Sales of our business increased.	.763		
	Prices of products in our business have increased.	.690		
	Cost savings were achieved in our facility.	.686		
	New market opportunities have emerged.	.579		
	The efficiency of our business has increased.	.569		
KMO= 0.877 p=0.00	Total Variance=60.40			

The original business performance scale has two sub-dimensions, namely economic factors and socio-ecological factors. Explanatory factor analysis was conducted to determine whether the same dimensions (structure) emerged in terms of the data of this study. As shown in Table 3, factor analysis with the Varimax Rotation method showed that the scale had more than two factorial distributions and that some items were not in the required size, so that seventeen was analyzed using the factor fixation method in order to stay true to the two-factor structure of the original scale. Thus, a two-dimensional structure was reached as in the original scale. As a result of factor analysis, it was concluded that both dimensions explained 60.4% of the total variance and KMO sample adequacy value was 0.88 and it was sufficient for factor analysis. It can be said that the scale has a similarity with the original scale in terms of structure and has a construct validity.

In the study conducted on 175 participants working in production enterprises, confirmatory factor analysis was performed in order to verify the structures of the scales described above. Whether the previously defined structure was confirmed in the new sample group due to the change in the sample property was examined by Confirmatory Factor Analysis (CFA). The CFA applied to the 23-item structure of the 2-factor scale of the green value chain applications scale was applied as a representative of the construct validity. Firstly, there are 5 items with non-significant t-value in the CFA analysis. This item was removed from the scale and the DFA model was re-established. When the compliance statistics of the items of the CFA model established with 18 items were examined, it was concluded that there were no incompatible items. It was seen that the items of the scale were confirmed to be compatible with the factors. The compliance index values of the green value chain applications scale were found as $\chi^2 / (df)$ 4.97, RMSEA 0.015, CFI 0.707. Since it is in the range of $0 \leq \chi^2 / (df) = 4.97 \leq 5$, it appears to exhibit acceptable agreement. When the RMSEA value is less than 0.015 critical value, it shows a good fit index by Schermelleh et al. [42]. The CFI and RMSEA values have an acceptable fit index by Schermelleh et al. [42]; Çapık [43].

Similarly, confirmatory factor analysis was conducted in the enterprise performance scale and CFA was applied to the two-factor 17-item structure of the scale as a representative of the construct validity. 2 items were found to be incompatible and this item was removed from the scale and the DFA model was re-established. When the compliance statistics of the items belonging to the DFA model established with 15 items were examined, it was concluded that there were no incompatible items. Compliance index values of enterprise performance scale were calculated as $\chi^2 / (df)$ 4.55, RMSEA 0.014, CFI 0.809, GFI 0.755 and all values were acceptable.

Findings regarding the research hypotheses

According to the results of the study, the correlation matrix showing the relationships between green value chain applications and business performance is given below.

Table 4. Correlation Matrix

	Mean	Std. Dev.	1	2	3	4	5	6
1. 1.Green Primary Activities	3.69	.71	1					
2. 2.Green Support Activities	3.61	.70	.702**	1				
3. 3.Economic performance	3.61	.68	.171*	.401**	1			
4. 4.Socio-Environmental Performance	3.98	.65	.203**	.303**	.646**	1		
5. 5.Green Value Chain Practices	3.65	.65	.923**	.922**	.309**	.274**	1	
6. 6.Business Performance	3.80	.60	.206**	.389**	.912**	.903**	.322**	1

** $p > 0.01$, * $p > 0.05$

In the study, the green basic and support activities constituting green value chain applications have scores above average (3.69, 3.61, 3.65). The socio-ecological performance constituting the enterprise performance has a higher score than the economic performance (3.61) with an average of 3.98. As can be seen in Table 4, there is a statistically significant positive relationship between the dimensions of green value chain applications and

enterprise performance dimensions. The severity of the relationships is weak and moderate, indicating that business performance increases as green value chain practices increase. This situation requires acceptance of H1 hypothesis that there is a significant and positive relationship between green value chain applications and enterprise performance ($R = 0.322$; $p > 0.01$).

In the study, simple linear regression analysis was performed to test the above hypotheses. The analysis and the findings are given in the tables below.

Table 5. Coefficient Table of Regression Analysis to Determine the Impact of Green Core Activities on Economic Performance

	Unstandardized Coefficients		Standardized Beta	t	Sig.
	Beta	Standard Error			
Constant	3.012	0.271		11.11	0.00
Green Primary Activities	0.164	0.072	0.171	2.28	0.02

Table 6. Results of Regression Analysis to Determine the Impact of Green Core Activities on Economic Performance

	R	R ²	Adjusted R ²	Std. Error of The Estimate	F	Sig.
Green Primary Activities	0.171	0.029	0.023	0.677	5.185	0.02

$P < 0.05$, Depended Variable: Economic Performance

The descriptive coefficient (R^2) in Table 6 is the most common form of measurement of the goodness of fit of the linear model. This coefficient shows how much of the change in the dependent variable is explained by the independent variable (s). This is a good expression of the explanatory power of the regression model. Therefore, it can be said that 0.029 of the change in economic performance is explained by the green basic activities independent variable in the research model. When the relationship between the variables is examined, the Beta coefficient of 0.171 indicates that there is a positive and weak relationship between green core activities and economic performance. Accordingly, the H2 hypothesis of the research that “green basic activities positively affect the economic performance of enterprises” is accepted.

Table 7. Coefficient Table of Regression Analysis to Determine the Impact of Green Core Activities on Socio-Environmental Performance

	Unstandardized Coefficients		Standardized Beta	t	Sig.
	Beta	Standard Error			
Constant	3.292	0.257		12.79	0.00
Green Primary Activities	0.187	0.068	0.203	2.74	0.00

Table 8. Results of Regression Analysis to Determine the Impact of Green Core Activities on Socio-Environmental Performance

	R	R ²	Adjusted R ²	Std. Error of The Estimate	F	Sig.
Green Primary Activities	0.203	0.041	0.036	0.643	7.473	0.00

$P < 0.05$, Depended Variable: Socio-Environmental Performance

Similarly, it can be said that 0.041 of the change in Socio-Environmental performance is explained by the green basic activities argument in the research model. When the relationship between variables is examined, Beta value of 0.164 indicates that there is a positive and weak relationship between green basic activities and Socio-Environmental performance. Accordingly, the H3 hypothesis of the research “Green core activities positively affects Socio-Environmental performance of enterprises” is accepted.

Table 9. Coefficient Table of Regression Analysis to Determine the Impact of Green Support Activities on Economic Performance

	Unstandardized Coefficients		Standardized	t	Sig.
	Beta	Standard Error	Beta		
Constant	3.012	0.271		11.11	0.00
Green Support Activities	0.164	0.072	0.171	2.28	0.02

Table 10. Results of Regression Analysis to Determine the Impact of Green Support Activities on Economic Performance

	R	R ²	Adjusted R ²	Std. Error of The Estimate	F	Sig.
Green Support Activities	0.401	0.160	0.156	0.623	33.064	0.00

P<0.00, Depended Variable: Economic Performance

In order to see the effect of employee-perceived green support activities independent variable on economic performance, which is a dependent variable, regression analysis results show that green support activities are statistically significant ($p = 0.00$) and positive (β value 0.171) and H4 hypothesis was accepted.

Table 11. Coefficient Table of Regression Analysis to Determine the Impact of Green Support Activities on Socio-Environmental Performance

	Unstandardized Coefficients		Standardized	t	Sig.
	Beta	Standard Error	Beta		
Constant	2.966	0.248		11.55	0.00
Green Support Activities	0.281	0.067	0.303	4.17	0.00

Table 12. Results of Regression Analysis to Determine the Impact of Green Support Activities on Socio-Ecological Performance

	R	R ²	Adjusted R ²	Std. Error of The Estimate	F	Sig.
Green Support Activities	0.303	0.092	0.086	0.625	17.44	0.00

P<0.05, Depended Variable: Socio-Environmental Performance

When the two tables above are considered, it is seen that green support activities have an effect of 8.6% on Socio-Environmental performance. A positive beta value indicates that the relationship is correct. In other words, Socio-Environmental performance increases as green support activities increase. The relationship is a weak relationship ($R = 0.303$). Significance level was $p < 0.00$. This result leads to the acceptance of the H5 hypothesis.

Results, Conclusion, and Recommendations

The necessity of today's enterprises to maintain the cost-benefit balance for sustainable competitive advantage has accelerated as a result of environmental pollution and accidents. Recognizing the necessity of the protection of the natural environment and the limitation of resources, awareness of sustainable development has gained importance in the world and they have turned to environmental management practices in enterprises. It acts with this awareness in all stages of business activities with environment-friendly business activities. Green value chain practices are among the important tools used for environmental management.

Despite the profit motive, which constitutes the most important objective of the enterprises, environmental protection and environmental practices were considered as cost-increasing activities for the enterprises and were implemented within the framework of legal obligations and obligations. This situation led to the evaluation of economic criteria before the social and ecological criteria. With the phenomenon of change and development

encompassing the world, businesses that wanted to survive in globalizing economies had to focus on providing competitive advantage in their products and processes. Therefore, environmental management practices and environmental performance criteria, which are the results of these applications, have gained importance for the enterprises.

With this study, it is aimed to determine the relationship between green value chain applications and business performance of enterprises, and to determine the impact of green value chain implementation, green basic and green support activities, on economic and socio-ecological performances.

In the research, green value chain applications and business performance averages of the enterprises are quite high. This may be due to the fact that approximately 80% of the enterprises participating in the study consist of medium / large and institutional enterprises. In the literature, according to authors such as Trotman and Bradley [44], Cowen et al. [45], Deegan and Gordon [46], corporate enterprises are expected to become more aware of environmental practices.

As a result of this research, a statistically significant positive relationship was found between green value chain applications and business performance. In this case, as the green value chain applications increase, the operational performance also increases. This situation requires acceptance of the hypothesis that there is a significant and positive relationship between green value chain applications and business performance. Previous studies reported positive relationships between environmental implementations and operational performance criteria such as a decrease in environmental accidents, an increase in research & development works, a decrease in process costs and an increase in quality according to Tan [7]; Gonzalez and Gonzalez-Benito [8]. Similarly, the findings of the study indicate that environmental practices are related to the economic performance of the enterprise (Rao and Holt [37] ; Cater et al.[9] 2009, Yang et al.[36]; Aykan and Sevim [2]) and their studies on both economic and socio-ecological performance (Gonzalez [8]; Yulihastri and Jin [10]; Aykan and Sevim [2]) support.

The research has some limitations. First of all, the research was conducted on the enterprises in a certain region and in a certain sector. This may pose a problem for the generalizability of the research. Performing local elections in Turkey in 2019, has created economic uncertainty and limitations in business performance in the presence of risk assessment. In addition, due to the fact that the concept of environmental sensitivity varies from person to person and from institution to institution, subjectivity may be involved in evaluating the applications of the participants in their enterprises.

It is known that environmental management practices are carried out mostly within the framework of legal obligations in enterprises. Considering it as a cost element in the short term and reflecting these practices to the company within the framework of individual environmentalism (volunteerism) understanding of the managers, it prevents the development of enterprises in this regard. At this point, it may be suggested that the researchers who will work on this subject will examine the green supply chain practices in the sample of enterprises having ISO 14001 environmental management system standard. Similarly, how green supply chain practices can create value on different sample groups; management approach, personality and leadership characteristics of managers, relationships between variables such as business structures and green value chain applications, and the effects of these relationships on the efficiency and efficiency of enterprises may be suggested.

Abstract

The aim of this study is to determine the relationship between high school students' identity functions and their views on their sense of belonging at school. The study group of the research, which is a relational screening model, consists of 430 students studying at high schools in Akçakoca district of Düzce province in 2018-2019. Identity Functions Scale and Sense of Belonging at School Scale were used as data collection tools in this study. According to the results of the study, it was found that high school students' sense of belonging to school and identity functions were above average and there was a moderate relationship between their identity functions and their views about their sense of belonging to the school. Based on the results of the study, it is suggested that necessary arrangements can be made for the students to find the support they need in the process of identity acquisition in schools, and measures can be taken for better understanding of the expectations of the students in order to increase the sense of belonging to the school and to reduce the feelings of rejection.

Keywords: Identity functions, belonging to the school, high school students

Introduction

Adolescence, which is one of the developmental stages of a human being, is the most turbulent, challenging and vital process of life and reaches its peak in almost every issue. In addition to all their physical changes and developments, adolescents sometimes compare their feelings with how they appear from the eyes of others overly and with great curiosity or engage in the question of how to wrap themselves up to the roles of individuals they idealize (Erikson, 1968). This quest can be expressed as a search for identity because the person draws a map of behavior and attitude with the answers s/he finds. Every individual makes conscious or unconscious efforts to obtain an identity. The search for meaning and identity, which can last a lifetime, dominates especially adolescence. In this period, developing the perception of identity and seeking answers to the questions of who I am and what I will become, which are considered as the most important tasks of the adolescent individual, are reflected in all the behaviors and attitudes of the young minds (Atkinson, Atkinson, Smith, & Nolen-Hoeksema, 2002). This process, which is experienced by young individuals, is also defined as identity development, acquisition, formation or confusion, and it progresses smoothly in some adolescents while it continues with serious problems in others (Demir, Dereboy, & Dereboy, 2009). Possible problems that may occur in the process are likely to appear more severely in the future stages of individuals' lives. The concepts of self and identity are frequently interchangeable and related phenomena and individual's perception of identity is directly and highly correlated with personality traits (Lounsbury, Levy, Leong, & Gibson, 2007) and have a functional role in expressing identity, as well as other factors contributing to identity acquisition (Costa & McCrae, 1994). While trying to maintain consistency and continuity in his / her self through roles, personality traits and many other influences throughout his / her life, the individual acquires an identity related to the patterns of his / her social relationships, social status, career choice, the perspective of life and other thoughts (Oral, 2012). In this context, the individual's perception of self and identity can be considered as two interdependent concepts that affect her/him throughout her/his life and are also influenced by the individual and her/his social environment.

The phenomenon of identity has been studied by a wide range of disciplines and has been expressed by psychologists, psychiatrists, and sociologists as the main means of understanding self and personality (Adams & Marshall, 1996). Identity is defined as a set of characteristics that determine what or who the person is (English Oxford Living Dictionaries, 2018) or it is defined as the symptoms, qualities, and characteristics that are unique to wo/man as a social being, and the conditions that make a person a certain person, all of the characteristics related to his personality (TDK, 2018). All definitions of identity, which are considered as a conceptual framework that adds direction, meaning, and purpose to life (Berzonsky, 2005), are related to the effort to make sense of one's existence. Identity is the consciousness that enables the person to act with a sense of purpose and direction in his / her life with the perception of internal consistency and continuity in time and space (Kroger, 2017). On the other hand, personal identity is a perception of sameness and continuity based on the individual's past and future expectations (Erikson, 1968). The development of a healthy personal identity makes people invulnerable to many clinical signs or problems throughout their lives (Verschuere, Rassart, Claes, Moons, & Luyckx, 2017).

Erikson, who directed the identity studies in the literature, spread the personal development of the individual to his/her whole life and developed a psychosocial approach to explain the concept of identity (Berzonsky, 2005) and he studied identity in a biological, psychological and social cognitive structure and he was inspired by previous psychoanalytic approaches (Kroger, 2008). The psychosocial development stages of Erikson include the classification of the processes of change that an individual has undergone in his life from birth to death. Hierarchical classification, the 8-step process of psychosocial development, refers to the change and development of the human being from birth to old age. In each development process, in every step where opposing expressions are used, there is a task belonging to that period and the result that occurs in case of failure of the task (Demir, 2011b). In this development process, the 5th step is expressed as identity (role) confusion versus identity acquisition and it covers the age range of 12-18 years to which the adolescence belongs (Erikson, 1968). Adolescents who go through this process healthfully have completed their identity acquisition process successfully by having consistent perceptions of who they are and what they will be (Arslan & Ari, 2008). The reason for the intense perception of identity seeking, especially in adolescence, is that physical and cognitive changes and decision-making mechanisms' becoming active (Atak, 2010). However, an individual who has a perception of identity can experience development and change in his / her identity during adulthood (Kroger, 2017). Arnett (2000), for example, stated that the process of identity acquisition was effective especially in the emerging adulthood (age range 18-25) with the theory he put forward about 50 years after Erikson and stated that adolescence plays an important role in this process. In summary, it can be said that an individual's search for identity is an endless process and therefore it continues to exist as an entity questioning the phenomenon of identity and self throughout his life.

The phenomenon of identity, which has been studied by many theorists, has been shaped in particular by Marcia's identity status. According to Marcia (2002), identity is an internal self-structuring and a dynamic formation of one's characteristics, abilities, values, and past. For Marcia, who puts 4 different identity statuses based on the dimensions of attachment and discovery, the acquisition of identity is completed by having a status, but then transitions can occur between the statuses (Atak, 2011). These identity statuses are examined under four headings: Identity diffusion, identity foreclosure, identity moratorium and identity achievement (Verschuere, Rassart, Claes, Moons, & Luyckx, 2017). Finding the identity of an individual at the end of a critical process ensures that he/she has an identity achievement, whereas the fact that he/she is in a crisis and postpones decision-making indicates that he/she has identity moratorium. While the identity status of individuals based on the values of others in the process of identity foreclosure, the indecisiveness and indifference of one's identity after the crisis shows his identity diffusion (Marcia, 1993). According to Marcia's approach to identity acquisition, one tries to reach a conclusion by weighing and questioning different alternatives of identity before making decisions about values, beliefs, and aims. S/He will then make a choice about the domain of the identity and start

implementing his/her choice (Žukauskienė, Truskauskaitė-Kunevičienė, Kaniušonytė, & Crocetti, 2018). In this context, adolescents can find different alternatives in order to make sense of identity choices in line with their abilities and goals and reflect them to their own commitment (Marcia, 1966).

Identity Functions

The process of identity acquisition of an individual is very important because it has consequences that affect the whole life and other people. In other words, the fact that an individual who has got a successful identity acquisition feels at home in his body (Erikson, 1968) and will make a direct difference not only in him/herself but also in his/her environment. Among the new approaches and models that support and expand Erikson's theory of identity acquisition, the Identity Functions Model, developed by Adams & Marshall (1996), which focuses on the outcomes of identity acquisition, is particularly striking; because, while other models focus on the process, identity functions give importance to the results of the acquisition and the values it adds to the individual (Demir, 2011a). The identity functions model provides a variety of psychological functions for individuals (Morsünbül & Uçar, 2017) and creates an internal system (Adams & Marshall, 1996).

Identity functions model offers 5 basic functions (Adams & Marshall, 1996; Serafini, 2000; Demir, 2011a):

- 1- Structure: Structure is an individual's understanding of who he is and recognizing himself. Self-understanding is expressed as the highest level of identity acquisition status. Thanks to structure function, one can minimize both physical and psychological concerns about himself/herself.
- 2- Aim: The aim is to give the person a sense of direction and meaning through various ties, values, and aims. The goal function allows the individual to be goal-oriented, to increase motivation and to be more successful in social relations.
- 3- Sense of individual control: Sense of self-control increases the sense of control and self-confidence that allows the person to express him/herself with a strong and independent will, reduces feelings such as embarrassment that estranges people from social life and strengthens the sense of autonomy.
- 4- Harmony: Harmony is the consistency between the feelings of harmony, values, beliefs, and thoughts that occur when one feels positive feelings towards himself. The harmony function ensures that the identity that the individual feels and lives / exhibits is in harmony.
- 5- Future orientation: Future orientation increases the level of awareness of one's future and provides a link between the present and the future. The future orientation gives the personal courage and self-confidence in the assessment of possible alternatives and provides the power to realize their potential in the process of self-realization and career planning.

Identity functions summarize Erikson's successful and healthy identity development on the road to successful identity acquisition. These functions are different from other theories about identity because while others focus on the acquisition process of identity, identity functions emphasize results and draw attention to the positive traces of healthy identity acquisition in the individual (Crocetti, Sica, Schwartz, Serafini, & Meeus, 2013). Successful identity acquisition is shaped by the discovery/research and determination/attachment processes of the adolescent (Erikson, 1968) and in the shaping of identity, the identity of the person is constantly subjected to the process of change and development under the influence of many different variables (Atak, 2011). In this context, it is certain that there are social effects that affect and shape the identity gains of adolescents. It is possible to say that the schools where adolescents spend most of their time are effective in the process of identity acquisition. At this point, the importance of the phenomenon of social identity emerges.

The self is not an autonomous psychological entity as a product of social interaction; on the contrary, it is rather a complex social structure (Hogg, Terry, & White, 1995). Within this structure, the self-perception of the individual, in other words, his / her perception of his / her identity, is related to his / her knowledge of the group

he/she belongs to, the values he/she imposes and the emotional meanings (Taifel, 1982). The individual has the need for belonging, and this need plays a decisive role in the development of both his personal and social identity (Kağıtçıbaşı & Cemalçılar, 2017; Alptekin, 2011). It is thought that a sense of belonging at school is influential on identity gains and functions, especially considering the fact that adolescents appreciate other people's perspective and have belonging needs in the construction of identity highly.

The Sense of Belonging at School

All human beings have an inner need to motivationally belong. As long as one belongs to someone or something, he/she can establish continuous, healthy and positive social relations (Baumeister & Leary, 1995). Sense of belonging is an individual's need to communicate with other people and acquire group identity (Lam, Chen, Zhang, & Liang, 2015). Belonging is not just about being inside or outside a group; it also includes the development of an individual's personal and social identity (Mucchielli, 1980 as cited in St-Amand, Girard, & Smith, 2017). Since the process of identity acquisition requires examination, questioning and decision-making experiences (Atak, 2011), it can be said that people invest in both their personal and social identities when they feel like members of the group they desire. Since schools are the most basic and first place of socialization in the construction of the social system, they can be defined as the environments that children and young people are expected to meet the needs of belonging.

Approaching schools as ecological systems consisting of personal relationships and cultural structures provides a better understanding of the dynamics of learning, education, student adaptation and subjective well-being, and the school environment provides the opportunity for most children and young people to communicate independently of their families and plays an important role in their psychological and intellectual development (Cemalçılar, 2010). When young people who spend the majority of their time in schools feel as part of their school life and feel peaceful, happy and safe, they will be more dependent on both education and school (Sarı, 2013). The feeling of belonging to social environments such as schools is more than adapting there; it means the feeling of being safe and having emotional commitment obtained by valuing and appreciating the environment (Hamm & Faircloth, 2005). It is known that the students who are accepted in their schools and who feel that they belong to their schools have lower negative affective experiences such as helplessness, exhaustion, boredom, and depression while they have higher academic achievement (Lam, Chen, Zhang ve Liang, 2015; Cemalçılar, 2010; Anderman, 2003). On the other hand, the tendency of students with a sense of school commitment towards risky behaviors is determined to be lower (Resnick, ve diğerleri, 1997). In other words, it is stated that the psychosocial development levels of the students in the academically risky group are directly proportional to their sense of belonging and self-esteem. (McMaken, 2000; as cited in Özgüngör & Kapıkıran, 2011).

The concept of belonging to school concerns the student's feeling as a psychological member of the school or the classroom (Goodenow & Grady, 1993), personal acceptance and respect, participation in activities, being seen by teachers and other stakeholders as part of the school, and the importance of his/her presence in decision-making system (Dukynaitė & Dudaitė, 2017; Baumeister & Leary, 1995; Sarı, 2013). There are also social factors such as academic factors that affect the student's commitment to school; in other words, the student associates his / her perceptions of the social structure of the school and his/her place in that structure with feelings of commitment to the school (Anderman, 2003).

In addition to the school culture and climate that affect the student's commitment to school, the relationship established with peers, teachers and school management is influential in the existing interpersonal network (Cemalçılar, 2010). It is seen that the students who receive social support in these relationships increase their academic success as well as their commitment to school and education (Cham, Hughes, West, & Im, 2014). With Social support, acceptance from peers, teachers, and school, adolescents who lack family ownership and acceptance will support their self-esteem which will increase their commitment to the school (Dukynaitė &

Dudaitè, 2017). Friendship provides the ability to cope with the social ecology of high school and provides a secure self-foundation for young people. Through these relationships, individuals feel both the sense of belonging to school while completing their identity development (Hamm & Faircloth, 2005). Another positive outcome of the sense of belonging to school is that adolescents develop positive and hopeful expectations for the future (Günalan, 2018). As a result, improving the sense of belonging of individuals who go through quite complex physical and psychological processes in adolescence to their schools provides multiple benefits.

On the other hand, if the student does not feel himself/herself belong to the school, his / her experience or perception is expressed as rejection (Sarı, 2015). Alptekin (2011) expresses the rejection phenomenon by the fact that whether there is a previous relationship between the unaccepted person and the rejecting person or community and the state of belonging that the person felt before. In other words, the unilateral suspension of relations in which there is initially restricted or temporary communication is expressed as rejection.

While acceptance at different levels of relationship bond includes high relationship value and importance for each individual, rejection refers to a trivial and low-value relationship and the responses of individuals to acceptance or rejection are of the degree of value given to the relationship (Blackhart, Nelson, Knowles, & Baumeister, 2009). However, the emotional and behavioral reactions of the person rejected by the group or people are generally negative and appear as bullying, discontinuation in education and violence tendencies especially in adolescent individuals (Arıkan, 2015). While the students' feeling of belonging to the school provides them with the right ties, goals, and values while providing them a healthy way to get their education, it also increases the development of self-confidence and the level of awareness towards their future. In other words, the sense of belonging to the school and the basic functions of identity functions are seen to be related. As a result, the acceptance of the student's feeling of belonging to school will not only increase his / her academic success, increase his / her motivation and ensure his / her attendance, it can also be said that it will leave positive traces in psychological and identity development and will be beneficial for self-development. It is thought that the ultimate aim of schools is to make students' feelings about the school positive in order to educate individuals who have a strong identity and self-perception.

The Aim of the Paper

This paper aimed to identify the relationships between high school students' views on identity functions and the sense of belonging at school. With this general aim in mind, answers to the following questions were sought:

1. What is the level of high school students' views on identity functions and sense of belonging to school?
2. Is there a significant relationship between high school students' identity functions and their views on school belonging feelings?

Method

Research Model

The study utilized a relational survey model. According to Karasar (2013), the relational survey model aims at determining the existence and level of covariance between two or more variables and if the status of one of the variables is known rather than the cause-and-effect relationship, the relationships found through screening can yield significant results in predicting the results of the other. With this model, the relationship between high school students' identity functions and their feelings about belonging to school was analyzed by correlation.

Working Group

In the 2018-2019 academic year, 430 students attending 2 Anatolian High Schools and the Social Sciences High School in the district of Akçakoca in Düzce participated in the study. 307 of the students are students in Anatolian High School and 123 of them are in Social Sciences High School. According to personal variables,

203 students were female and 227 were male; 116 of them attended the 9th grade, 105 of them attended the 10th grade, 104 of them attended the 11th grade and 104 of them were in the 12th grade at the time of the study.

Data Collection Tools

Personal information form, Identity Functions Scale and Sense of Belonging to School Scale were used to reach the personal information of the students.

Identity Functions Scale

The Identity Functions Scale developed by Serafini, Maitland, and Adams (2006) and validated by Demir (2011a) consists of 15 items and 5 sub-dimensions: Structure, Harmony, Purpose, Future and Control. The 5-point Likert type scale is rated with a range from “completely agree” to “completely disagree”. The Cronbach Alpha values for the reliability analysis were found as follows: .70 in structure, .76 in harmony, .80 in aim, .75 in future and .77 in control dimension. The five sub-dimensions of the scale are calculated by adding the item scores of each dimension. In this study, Cronbach Alpha coefficients were as follows: .56 in structure, .70 in harmony, .78 in aim, .72 in future, .61 in control dimension and .88 in total. However, structure and control sub-dimensions were not included in the study because Cronbach Alpha coefficients were lower than accepted values; after subtracting these dimensions, internal reliability coefficient was found to be .86. The mean scores of the sub-dimensions of the scale and the level of characteristics of the dimensions included in the individuals are proportional.

Sense of Belonging to School Scale

Developed by Goodenow C. (1993), and validated by Sarı in Turkish (2015), the Sense of Belonging to School Scale consists of 18 items and 2 sub-dimensions of school attachment and sense of rejection. The 5-point Likert type scale is rated with a range from “completely agree” to “completely disagree”. The Cronbach Alpha values were found as follows: .84 in school attachment sub-dimension, .78 in sense of rejection sub-dimension, and .84 in total. In this study, Cronbach Alpha coefficients were as follows: .85 in school attachment sub-dimension, .72 in sense of rejection sub-dimension, and .88 in total. The evaluation of the scale is based on the score ranges used in Likert type scales as Never (1): 1.00–1.80, Occasionally (2) 1.81–2.60, Sometimes (3): 2.61–3.40, Often (4): 3.40–4.20, Always (5): 4.21–5.00. The general values of the scale and the average values of the scores obtained from the sub-dimensions are directly proportional to the degree of sense of belonging to the school.

Data Analysis

The data were analyzed using the SPSS for Windows 22.0 program. The normalcy of data distribution was examined by a Kolmogorov-Smirnov test to identify the analysis that will be undertaken before analyzing the data according to the sub-problems. According to the results of the analysis, it was found that not all variables showed normal distribution ($p < .05$) and therefore non-parametric analyses were used in this study. According to this, percentage and frequency were used for personal variables, standard deviation and mean were used to determine students' identity functions and sense of belonging levels to school and Correlation analysis (Spearman's Rho) was used to determine the relationship between identity functions and sense of belonging to school. The level of significance was found to be .05.

Findings and discussion

Students' Opinions about Identity Functions

Table 1: Students' Opinions about Identity Functions

		N	\bar{X}	Ss
Identity	Harmony	430	3.99	.7378
	Purpose	430	3.96	.8486

Function	Future	430	3.66	.8720
Scale	Total Scale	430	3.87	.7036

According to Table 1, in terms of students' views on identity functions; the mean of the students ($n = 430$) was found to be $\bar{X} = 3.99$ in the harmony dimension, $\bar{X} = 3.96$ in the purpose dimension, $\bar{X} = 3.66$ in the future dimension and $\bar{X} = 3.87$ in the total scale. According to these findings, it is seen that the highest average in the harmony sub-dimension with $\bar{X} = 3.99$ with "often". The lowest average is again relatively high with $\bar{X} = 3.66$ in the future sub-dimension. The level of identity functions of the students was high with $\bar{X} = 3.87$.

When the findings obtained were examined, it can be interpreted that high school students had a high level of opinion in all scales and sub-dimensions, that they had positive impression and emotion towards themselves, that they were free from confusion between their beliefs, values, and behaviors, and that they had a significant cognitive level towards their goals and a certain level of awareness for their future. Relatively low-level average in the future sub-dimension can be attributed to the impact of the educational process. High school students who are on the eve of important exams to shape the rest of their lives may be perceived as normal if they are concerned or confused about this topic. Given the importance of adolescence in the process of identity construction, these findings can be considered as positive and promising results. Because today's young people who are in harmony with themselves and their surroundings, who have a certain purpose and a set of values and who consciously look forward, point to the existence of adults of tomorrow who have successfully developed the identity acquisition.

Students' opinions about Sense of Belonging to School

Table 2: Students' Opinions about Sense of Belonging to School

		N	\bar{X}	Ss
Sense of Belonging to School Scale	School attachment	430	3.68	.6586
	Sense of rejection	430	3.70	.8711
	Total Scale	430	3.38	.6606

According to Table 2, in terms of students' views on the sense of belonging to school; the mean values of students ($n = 430$) were found to be $\bar{X} = 3.68$ in the school attachment sub-dimension, $\bar{X} = 3.70$ in the rejection sub-dimension, and $\bar{X} = 3.38$ in the total scale. In the light of the findings, it was seen that the highest mean value was in rejection sub-dimension ($\bar{X} = 3.70$) while the lowest mean indicates the finding of the total scale ($\bar{X} = 3.38$). All of the averages are moderate and they seem to be close to each other.

Although the findings obtained seem to be contradictory especially in the sub-dimensions, it can be said that the scale is gaining meaning when looking at the total scale. It is seen that high school students feel rejected at same the rate they feel attached to the school and it is remarkable that their sense of belonging to the school is below the desired level. These findings almost correspond to the results obtained in the literature (Arıkan, 2015; Goodenow & Grady, 1993; Nichols, 2008; Sarı & Özgök, 2014). In this respect, it can be said that the students of the new century have a contradictory and skeptical perspective about the sense of belonging to the school. It can be thought that the fact that the school is the only address that has access to information has changed and that the expectations of young people from the concept of school have been seriously transformed. In other words, it can be stated that old schools do not give today's students the feeling of being at home enough.

The relationship between students' views on identity functions and their sense of belonging to the school

Table 3: The relationship between students' views on identity functions and their sense of belonging to the school

Scales		Harmony	Purpose	Future	Identity Functions Total
Attachment to School	r	,362**	,376**	,385**	,438**
	p	,000	,000	,000	,000
	N	430	430	430	430
Rejection	r	,205**	,294**	,200**	,280**
	p	,000	,000	,000	,000
	N	430	430	430	430
Total Belonging to School	r	,340**	,383**	,341**	,423**
	p	,000	,000	,000	,000
	N	430	430	430	430

Table 3 shows the Spearman Rho coefficients related to the correlation analysis conducted to determine the relationship between the levels of identity functions of the students and the sense of the students about belonging to the school. When Table 3 is examined, it is seen that there are moderate and low-level relationships between the identity function levels of students and their emotions of belonging to school both in the total scale and between the sub-dimensions. Büyüköztürk (2012) defines the correlation coefficient to be between 0.70-1.00 as high value, between 0.70-0.30 as medium and between 0.30-0.00 as low-level correlation. The medium level of relationship between school commitment total score and identity functions total scale is striking. Increasing students' sense of belonging to school can be expressed as an indicator of the development of identity functions in a healthy way. Similarly, it can be said that students' sense of belonging increases with a high level of identity functions that focus on the results of the process of identity acquisition. In this respect, it can be concluded that school feeling has a positive effect on not only the academic performance of the student but also the other elements of his/her life and the students who try to get to know and position themselves in society have positive self-affectations.

The fact that the school commitment sub-dimension is highly correlated with the whole of the Identity Functions Scale and all sub-dimensions indicates that students' sense of school commitment increases with their identity functions in direct proportion and it draws attention to the importance of having a sense of belonging of students in the periods of identity development. The importance of the values gained to the individual, which is the focal point of identity functions, increases with belonging to the school and this may mean that the school makes the right approach and contribution to students' individual development. High school education has an important place in the life of young people as a process in which students have the opportunity to socialize after the family environment. It can be stated that he/she will have healthy identity functions in the environment in which he/she belongs, which is promising for the future. Relatively low relationships in the rejection sub-dimension can be considered as reasonable considering the other sub-dimension and scale. Then students who feel rejected in school will have more difficulty in structuring their self-perception and identity functions will not develop as desired. In this context, the student creates an image for himself with the impressions he has received from the students' environment and it is inevitable that negative effects will influence this image. For this reason, it can be stated that the feeling of rejection of students has an important place in the identity function and the student will develop his / her critical point of view.

Conclusion and Recommendations

The development of identity, which is known as the most critical stage in the life of the individual, accelerates the development of identity, and the identity functions that arise as a result of this development have importance to affect both himself and his environment throughout life. The young individual will become a candidate for

having a healthy adulthood by recognizing his / her perception and self and having positive feelings towards them, acquiring values that can give direction to his / her life, being compatible between his / her self and his / her identity and having the courage, self-confidence and awareness towards the future. However, disruptions in this process may cause traces that will affect the lives of young people.

Young people enter the social environments that leave the most traces of them at school. The school is not only an educational institution; it also has an impact on the developmental processes of the individual. Students have positive feelings about their self and identity in the environments in which they feel being accepted and approved. In this context, the student's sense of belonging to the school and the acquisition of identity functions correctly can be seen as an interactive process.

Based on the research findings, it can be said that high school students' sense of belonging to school and identity functions are above average. In line with these results, it can be stated that students' perceptions about their self are at the forefront in their identity functions, just like in the process of gaining an identity, and that feeling of belonging to school is related to both personal variables and the way of perceiving the school.

The research findings highlighting the importance of school experiences, which is one of the important factors that make young people, the guarantee of our future, become healthier, coherent, self-confident and happy adults are considered important for us to understand their identity functions as well as their perspectives on life and school.

Based on the results of the research, the following recommendations were developed:

- Necessary arrangements can be made for the students in order to find the support they need in identity acquisition processes in schools.
- In order to increase students' sense of belonging to the school and to reduce their feelings of rejection, measures can be taken by better understanding their expectations from the school.
- This research can be carried out in public and private education institutions in different provinces, and in-depth analysis of students' views on the subject can be done through qualitative and mixed studies.

Abstract

The aim of the study is to determine the opinions of teachers working in secondary schools and high schools in the district of Akçakoca in Düzce about the phenomenon of diversity and the management of diversity in educational environments and to make suggestions according to the results of the research by shedding light on the possible problems that will be encountered during the management of the diversities. The study group of the research, which was conducted with qualitative research design, consists of 40 teachers working in various schools in Akçakoca during the 2017-2018 academic year. According to the results of the research, it is revealed that diversity management in schools is not at the desired level, there are not appropriate approaches to the spirit of the age and it is necessary to take important steps in order to correct this situation.

Key Words: Diversity, Diversity Management, Teacher

Introduction

Diversity and Diversity Management

Human beings are differentiated without any effort with their innate gender, race, ethnic origin, and physical characteristics and they try to both look like and differentiate from others throughout their lives, which can be explained as the effort of one's identity formation (Sürgevil, 2010). The individual catches attention with his differences rather than similarities in the effort of obtaining identity. It takes time to recognize what is similar while dissimilar ones can be distinguished easily.

Turkish Language Institution (TDK) (2018) defines "diversity" philosophically as the characteristic of natural, social and conscious based every event and phenomenon that differs from all others; diversity can also be defined as an individual or organizational diversity/variety that is innate or acquired through socialization (Saylık, Polatcan, & Saylık, 2016). Although the difference is mostly related to individuals and groups who are perceived as different or "the other" and often emerges from the understanding that gender, ethnicity or disability is a disadvantage, its meaning has changed in terms of academic, educational and administrative aspects (Morrison, Lumby, & Sood, 2006). In other words, individuals' educational level, their perspective on life and the culture they live in differentiate them. Being different is not a choice and there must be difference wherever there are people (Barutçugil, 2011). Diversity is the difference in terms of the various characteristics of individuals in general (Demirel & Özbezek, 2016); and the individual, economic, social, cultural, physical and intellectual characteristics that distinguish them from others (Kara, 2016). Based on all these definitions, it is thought that the difference is not only physical or apparent qualities but also social characteristics such as personality, culture, religious belief, sexual preference, lifestyle, ethnicity, marital status are within the definition of the difference. As a result, differences are characteristics that come with existence beyond one's choices on one hand and they defined as the characteristics acquired intentionally or by exposure through cultural and social means on the other hand.

Since people are living and working entities within groups, they carry their differences to the environment, group or organization to which they belong or where they want to belong. This complicates organizational behavior approaches. Because every person trying to gain an identity as an employee is complex and this complexity occurs differently in every individual and organizational environment. As the most important stakeholder of the organization, employees exhibit not only their professional behavior but also their individual differences in their working environments. They bring their characteristics and individual differences acquired from the social environment to the organization where they work (Atasoy, 2012). These individual differences reveal the contradiction of being a threat and wealth for the organization while maintaining its sustainability and achieving its goals. This conflict brings about the management of diversity in organizations (Memduhoğlu & Ayyürek, 2014). It would be correct to say that the impact of different individuals in the organization will be whether positive or negative is related to how it is managed.

If the profile of employees in an organization reveals differences according to demographic or other qualifications, there may be differences also in that organization (Seymen, 2006) and managing this difference requires systematic and planned, stable practices to recruit, maintain, reward and promote a heterogeneous mix of employees to the organization (Ivancevich & Gilbert, 2000). Likewise, diversity management is a multidimensional and philosophical approach that aims to maximize the performance and productivity of all employees in the organization (Memduhoğlu, 2013) and it focuses on the importance and management of outcomes rather than the cause of the difference (Linehan & Hanappi-Egger, 2006).

A group of differences can be considered as a set of values that both affect and influence the organization while simultaneously preserving its intrinsic (Schermerhorn, Osborn, & Hunt, 2000). Increasing diversity in organizations increases the problem-solving skills of the groups, provides better service to customer diversity and supports organizational creativity (Gilbert, Stead, & Ivancevich, 1999). In other words, the correct evaluation of the differences among the employees of the organization makes it easier to respond to the diversity of the target audience.

For organizations, differences have both positive and negative consequences. For example, differences are useful for working groups since they create positive value judgments, and improve the interaction of teamwork (Sürgevil, 2010). In working environments where diversity is accepted and valued, learning and creativity are encouraged and inspiring behaviors among employees increase (Memduhoğlu, 2013). The most important positive outcome of diversity management is that employees are motivated to perform independently of all physical, mental, social and emotional barriers, create a working peace, and each of them is allowed to benefit from their skills (Barutçugil, 2011). In addition, the presence of employees with different characteristics increases the value migration to the organization and provides time and effort in completing the work with different expertise of people in teamwork (Begeç, 2004). As a result, diversity management is necessary and beneficial because it is possible to make optimal use of all human resources in the organization (Aksu, 2008). On the other hand, the negative aspects of diversity management are the adverse effects of working groups on social integration and communication issues, reducing the performance of group members and reducing job satisfaction when they cause conflicts (Sürgevil, 2008). Difficulties of working with individuals with different characteristics for the same job and chaotic environment where different ideas will emerge are also among the disadvantages of diversity (Barutçugil, 2011). Another drawback of diversity management is the belief that employees are not treated equally and fairly (Ünalp, 2007). However, these negative situations do not eliminate the fact that organizations are composed of different individuals. In other words, despite all possible risks, employees should exist with their differences.

Management of Diversity in Education

As micro examples of social structure, each school has become a whole with employee differences. Although they share the same language and relatively similar culture, teachers and school administrators are different individuals who have come together to achieve the goals of the school. It is usual and customary to reflect these differences both on their professional perspectives and on their communication with their environment. While these differences should not disrupt school harmony, according to the new world approach where speed is dominant, teachers do not like to be assimilated or hide their individual characteristics and differences and expect to be accepted as they are. This leads to the need to recognize the diversity of each individual and to manage it in accordance with the school's objectives.

It is observed that the concept of diversity management in educational organizations generally focuses on the ethnicity and gender of teachers. However, the difference of the teacher is not limited to these facts; personality traits, physical traits or cultural tendencies also make them different from others (Memduhoğlu, 2013). It does not seem possible to talk about education management without taking into account the individual preferences of the teachers such as age, appearance, dress choice, religious belief, and political opinion. Leadership fiction, which is based on diversity management, will not only create respect for the different, but also positive changes in school culture and role model effects for students (Balyer & Gündüz, 2010).

The difference that exists in schools creates a rich and productive workforce which is difficult to manage. Making this diversity contributing to the school and avoiding possible problems also depends on the quality and success of the training the managers (Memduhoğlu, 2011). In this context, it is clear that the differences of the employees should be handled with seriousness in order to create a culture of peace in the school and achieve the aims of the organization. In other words, it is important to create awareness of diversity.

The purpose of this research is to determine the opinions of teachers working in secondary schools and high schools in the district of Akçakoca in Düzce province on the concept of diversity and the management of diversities in educational environments and to make suggestions according to the results of the research by shedding light on the possible problems that will be encountered during the management of the diversities.

Method of the research

This study is a case study which is one of the qualitative research types. Case study research, which is a type of pattern in qualitative research and which can be both the product and the object of the research, is a situation portrait in which the researcher collects detailed and in-depth information about the real life, the current limited situation or the multiple constrained situations within a certain time. It is a qualitative approach in which case themes are introduced (Creswell, 2016).

Working Group

The study group consisted of 40 teachers (23 female and 17 male) working in Akçakoca district of Düzce province. 33 of the teachers have 10 years of professional seniority and 7 of them have less than 10 years of seniority. 36 of the participating teachers have a bachelor's degree and 4 of them have a master's degree.

Data Collection Tool

Interview technique was used to determine the opinions of teachers towards diversity management. In the process of developing the semi-structured interview form used in the research, the related literature was searched and questions were formed in line with the conceptual framework, and expert opinions were consulted to ensure internal validity. Expert review is an important strategy to ensure validity and reliability in qualitative research. In order to increase the reliability of the research, field experts' opinions, criticisms, and feedback help to reveal the scientificness of the study from the research design process to the process of data collection, analysis and writing of the results (Yıldırım & Şimşek, 2006). The semi-structured questionnaire of the research was prepared in accordance with expert opinions and finalized and the questions were presented to the participants. Data

collected from volunteer teachers through the form was analyzed by descriptive and content analysis technique. While analyzing the opinions of the participants, the teachers were shown by coding in the form of K1, K2 in order to ensure that their identity is unclear. The common views of the teachers were shown in the tables under the themes created in line with the frequency of views, and the codes created by direct opinions were supported. Since one participant stated more than one opinion in the tables, total opinion was not given. As some of the questions posed to the participants gave similar results on similar subjects, their analyses were conducted together. In the interview form, the teachers were asked the following questions:

- 1) What does diversity mean to you? Do you think that you have some determining features that help your friends perceive you in your school? (Culture, personality, age, gender, physical appearance, etc.) What are these characteristics and how do you understand that they identify you with this difference?
- 2) How do you react to the approach of your colleagues and your school's director towards your differences? How does this situation affect you?
- 3) What are the differences that your colleagues and managers do not accept?
- 4) Do your school administrators use the differences of teachers as advantages and disadvantages? Please explain.

Findings

Table 1: The concept of diversity and teachers' opinions about the features that make them feel different

The concept of diversity	n	Features that make them feel different	n
Being unconventional	17	Personality characteristics	27
Physical and spiritual separation	16	Physical characteristics	7
Being original, out of bounds and extraordinary	15	Cultural Characteristics	5
Wealth and diversity	8	No significant difference	8
Having a different perspective	5		

When the opinions of teachers about the concept of diversity are examined in Table 1; the diversity is defined as being unconventional ($n = 17$), being separated from others physically and spiritually ($n = 16$), being original, out of bounds and extraordinary ($n = 15$), wealth and diversity ($n = 8$) and having a different perspective ($n = 5$). This finding shows that teachers generally have a positive perception of the phenomenon of diversity. One of the participating teachers K9 has dealt with the phenomenon of diversity in many aspects and gave a comprehensive definition as "Diversity is wealth. Everything that is identical is monotonous and boring. Diversity causes excitement and conflict. Visually different objects standing side by side look good. Therefore, every individual needs to be different, this is the necessity of being human and it is good." K23 pointed out the concept of diversity as the opposite of mediocrity by saying "The one who doesn't behave the same or who cannot be identical with the others under the same conditions can be called as different." The K19 approached the concept from a slightly different perspective. He thinks the difference is equivalent to the contradiction by saying that "In a community, the diversity is considered to be separate/contrary from the usual". These definitions coincide with the definitions made for the concept of diversity in the literature (Kara, 2016; Demirel & Özbezek, 2016; Memduhoğlu, 2011).

When the opinions of the teachers about the determinant characteristics that make them feel different were examined, the majority of the teachers ($n = 27$) emphasized personality traits, while 8 teachers stated that there was no significant difference. The concepts given for other defining characteristics are physical ($n = 7$) and cultural ($n = 5$) features. The fact that teachers feel that they are different from their personality traits emphasizes their differences from everyone in terms of human creation. The fact that diversity of personality traits come to

the forefront in the organizational environment can be considered as a normal result of diversity. One of the participating teachers, K21 emphasizes that he sees personality traits as determinant by saying “I think I am more prescriptive, hasty and planned than my friends. I am a person who can find practical solutions and this makes me different in school”. K8 emphasizes his/her demographic characteristics as “First of all, being a young teacher makes me feel different as a new teacher. In this way, I think that I can communicate more easily with students, but I also feel incompetent among experienced teachers.” The teacher, who perceives being young as a diversity, also states the advantage and disadvantage of this diversity and states that this difference can be an obstacle from time to time. With a critical approach to the uniformization of teachers, K28 says that “Obviously I don't feel different. I think this is a general problem in the world of education. Everybody entering the system becomes uniform after a while and this is a problem.” The lack of diversity in the organization can be considered as a negative result. Because it can be stated that the teacher who has lost his individual differences within the education system has also lost his innovative perspective in order to adapt to the system. This situation supports the opinion that diversity is necessary for the working environment.

Table 2: Teachers’ Opinions towards the Approach of Other Teachers and School Administration to Teachers’ Diversities

The approach of Other Teachers	n	The approach of School Management	n
Positive, respectful, acquiescent	30	Positive, respectful, acquiescent	16
Disturbing, modificatory	5	Negative, rejecting	13
Creating clash environment	2	Not aware of differences	11
No response	3		

Table 2 shows the teachers’ opinions about the approach of other teachers and school management towards teachers’ diversities. Although the approach of other teachers and school management to diversity are similar, it can be stated that teachers are more moderate and school administrations are more negative. Because it is seen that teachers (n = 30) show a positive approach to differences while the school administration is stated to have a negative, rejecting (n = 13) attitude or not being aware (n = 11). This situation indicates that teachers are more successful and respectful in their communication with their colleagues while their relationship is more limited to the school administration. It can be stated that managers who perceive the diversity of teachers as negative or who are not aware of this difference are weak in terms of diversity management. One of the participating teachers, K6, stated that the diversity was looked askance at, but this did not influence him by saying “The fact that I have a different worldview than others is not welcomed by teachers or administrators. We fall into conflict from time to time, but they can't change me”. The effort to remain unchanged despite the negative reaction to their diversity is having another diversity. In this case, it can be thought that some people tend to be assimilated while others do not. On the other hand, K11 states that the school administration is not acquainted with his/her true self and is not aware of his/her differences by saying “My best friends know I'm different. The school administration doesn't know me enough or doesn't realize my different characteristics because they don't make an effort for it”. This situation can be perceived as an individual's own preference or a lack of communication between the teacher and the school administrator. If a manager who should create a harmonious work environment is not efficient for recognizing the employees, it can be interpreted as a deficiency. K17 states that the differences are accepted and that he works in an institution where there is a culture of peace by stating “I work with a lot of different people at school and that's no problem for us. Our manager also very understands this issue. For our school, this situation allows us to work peacefully”. In peace-oriented organizational settings, employees are expected to create organizational harmony with their individual characteristics, which can only be achieved by recognizing diversity, respecting them and managing them correctly.

Table 3: Teachers’ Opinions about Acceptance of Individual Diversities at School

Diversity types rejected by teachers	n	Diversity types Rejected by School Administration	n
Differences incompatible with the general environment of the school and contrary to general morality	16	Any opinion that differs from the opinion of the school manager	21
Differences in political opinion	13	Differences in political opinion	16
Differences in religious belief/opinion	11	Differences disrupting school culture and contrary to general morality	12
Differences in clothes	9	Working indiscipline	10
Sarcastic, selfish, snitch and exclusionary behaviors	8	Differences in religious belief/opinion	9

Table 3 shows teachers' opinions about the acceptance of individual diversities of teachers at school. Among the most repetitive views that the teachers did not accept were differences that were incompatible with the general environment of the school, contrary to general morality (n=16), differences in political views (n=13) and religious beliefs (n=11). For example, one of the participating teachers, K18, gives an example of the general situation in schools by saying that "Differences that may be negative examples to our students or disrupt the peace of the school environment are unacceptable. Unsuitable differences, such as different sexual orientation, colloquial slang or extreme points in clothes can be disturbing". The fact that teachers are role models for students can be seen as the reason for this situation. K25, on the other hand, emphasizes the tendency of politicization in Turkish national education in the recent period and states that the differences of thought are negatively met by saying "In schools, teachers who have the opposite view of the general tendency are generally not accepted. Especially those who are politically opposed have serious problems". Since this situation is incompatible with the phenomenon of diversity management, it contradicts with the fact that the correct orientation of the diversity of thought contributes to the working environment. This is because the teacher will be autonomous to the extent that he/she can express his / her opinion within the framework of respect and thus, professional attitude behaviors will be developed. K30 states that teachers with different opinions are under pressure and criticizes standardization by stating that "To think differently from the school principal is enough reason not to be accepted. It doesn't matter if your opinion is right or logical". The school administrator can enrich and improve the perception of management by the presence of different sounds and colors rather than people who think like him/her. Therefore, disrespect or disregard for those who think differently from their own thinking can be seen as a deficiency in diversity management.

Table 4: Teachers' opinions towards school administrators' being open to teachers' diversities

	The school manager is open and respectful to differences	n	The school manager is not open and respectful to differences	n
	turns differences into an advantage	19	Does not takes the differences into consideration, goes his own way	25
Administrator	Makes assignment by considering differences	14	Does not let teachers talk about differences	21
	Differences are allowed to be spoken freely	15	Gives negative responses to differences	12

In Table 4, teachers' opinions of the school administrators about teachers' diversities are given under two themes, positive and negative. It is stated that school administrations that are open and respectful to teachers' diversities turn differences into advantages for teachers and schools (n = 19), assignments are made in this direction (n = 14), and differences are allowed to be expressed freely (n = 15). It can be said that these behaviors represent the cornerstones of diversity management in education. In a school with as many diversities as the number of employees, the differences that are turned into advantages will not only make people peaceful but will also bring organizational success. For example, K3 gave an example of this view as "Our school uses our differences as an advantage when creating work teams in the school. For example, they include teachers who speak a foreign language and have a culturally different perspective to the EU project preparation team". K1

views give an example of this situation by saying that “Our differences are occasionally used in assignments. I think this situation increases the competitive environment in the school”.

On the other hand, it was stated that administrators who are not open to and respect for teacher differences carry out the management process without considering these differences (n = 25), that they do not allow the expression of differences freely (n = 25) and that they react negatively (n = 12). K7, one of the participants, stated that the managers were closed to different opinions by stating that “The whole system in the school is progressing result-oriented, so the important thing is to get the job done as soon as possible. Our managers do not care much about our diversities in this process. What matters is not your differences but your individual relationship with the manager”. K13 again states that managers are closed to different opinions as “When the people are commissioned to a school, the manager wants to work with those close to his / her idea. Seems to be a criterion that we are similar to the manager, not having different skills”. K29 states that the reactions to different aspects make him uneasy by stating “We are all different and carry a wide variety of traditional structures to school. In some personal issues such as clothing, a different formation causes me to feel burnout in a professional sense. School administration is more moderate to uniform people”. Commenting on political thought, which is one of the important differences that are unacceptable and reacted, the K40 shares teachers' views that they are being pressured beyond their rejection saying that “In our school, politically different views are unfortunately digested. I don't think it's right for teachers to give political views in the professional field, but there are many situations where we have to remain silent even in our own social environments at school.”

Conclusion, Discussion, and Recommendations

Today, it is not enough for organizations to use their economic capital effectively in order to survive in the global competitive environment, but they should also use human resources correctly (Atasoy, 2012). This correct use brings the concept of diversity management with it. In the 1970s, the definition of diversity has a structure that includes minorities and women in the working profile, but today it has gone beyond simply discriminating against minorities (Keil, et al., 2007), and it involves diversity, gender, language, ethnic origin, cultural background, religious belief, education level, life, income, personality, sociocultural structure, and family responsibilities (Mercan, 2016). Schools, which are the most important examples of these social organizations, will be successful and productive to the extent that they correctly manage and direct the different employee profiles. Therefore, the management of diversities in education is not only important for educational purposes but also for organizational behavior approaches and its necessity is increasing day by day.

According to the results of the research, while the teachers generally show a moderate and respectful approach to each other's differences, school administrations can give more rigid and even repressive reactions. It can be said that teachers who experience their diversity as a problem will cause them to feel burnout both individually and professionally. Especially the presence and exclusion of teachers who feel differently in political, religious and cultural contexts can be seen as obstacles in the construction of peace in schools and in providing democratic educational processes to the students. The existence of administrators who can use the individual diversities of the teacher to the benefit of the school will have the opposite effect and will not only provide the personal happiness of the teacher, but also the pioneer of social change.

Based on the results of the study, it is proposed to keep the difference in schools on the agenda for all school stakeholders and to raise awareness of school administrations with the education of teachers and students. It is recommended that school administrators should be subjected to an audit system based on objective criteria in order to manage teachers' diversities correctly and this research should be enriched by taking the opinions of school administrators and students also.

Abstract

The aim of this study is to examine the relationship between the participation of teachers in professional development activities as a dimension of lifelong learning process and gender and necessity situations. Within the scope of PISA 2015, teachers were asked their gender and whether they should participate in professional development activities (TC021Q01NA-Do you need to participate in professional development activities?). In the past 12 months, teachers have been involved in professional activities, were asked to participate. In the PISA 2015 report, not only data on students' academic achievements, but also data on teachers' professional development is included. Teachers are trained before and after the profession to contribute to their development. In this study, Phi Coefficient was calculated to determine the relationship between the nominal variables. According to the results of the analysis, there is a low significant relationship between the variables.

Keywords: Lifelong Learning, Professional Development, Teachers

Introduction

Lifelong learning was an important agenda item in the work of international organizations such as UNESCO, OECD and the European Union in the 1970s. (Doğan & Kavtelek, 2015). For people, lifelong learning is a goal in itself. Lifelong learning is very important for finding a job, protecting a job and working in a job. It should also contribute to the ability of employees to cope with unemployment and early retirement, and to access and reopen business opportunities. Lifelong learning is also the foundation of society as a whole to promote democracy and human rights, solidarity and international awareness and to prevent social exclusion. (Charungkaittikul & Henschke, 2014).

Lifelong learning of teachers has a wide range of professional development, including professional development. High levels of lifelong learning of teachers in developed societies are among the most important issues (Özer & Gelen, 2008). Teachers participate in various in-service trainings to realize their personal and professional development. Increasing the quality of teachers is considered to be directly proportional to the increase in the quality of education (Seferoğlu, 2004). In a world of constant change and renewal, it is inevitable for teachers to update themselves in their professions (Demirel & Budak; Guskey, 2002). Changing technological and social trends also affect the expectations of teachers. It is possible to keep up with the changing world and modern education by adapting the knowledge, skills and attitudes that teachers should have (Guskey, 1986).

Problem statement and sub-problems (hypotheses)

The aim of this study is to examine the relationship between the participation of teachers in professional development activities (Knowledge and understanding of subject field(s), Pedagogical competencies in teaching any subject field(s), Knowledge of the curriculum, Student assessment practices, ICT skills for teaching, Student behaviour and classroom management, School management and administration, Approaches to individualized learning, Teaching students with special needs, Teaching in multicultural or multilingual setting, Teaching cross-curricular skills, Student career guidelines and counselling, Internal evaluation or self-evaluation, Use of

evaluation results (Teacher-parent cooperation) as a dimension of lifelong learning process and gender and necessity situations.

Method

Method of the research

The study is in the descriptive model.

Population-sampling,

The participants of the study are 53860 teachers from 17 different countries or regions. The distribution of the participants is presented in Table 1.

Table 1. Participations

Countries	Frequency	Percent	Countries	Frequency	Percent
United Arab Emirates	4428	8,2	Hong Kong	1820	3,4
Australia	7297	13,5	Korea	2125	3,9
Brazil	5315	9,9	Macao	2390	4,4
Chile	2337	4,3	Peru	2877	5,3
Colombia	3240	6,0	Portugal	2243	4,2
Czech Republic	3731	6,9	B-S-J-G (China)	3869	7,2
Germany	3490	6,5	Chinese Taipei	3099	5,8
Dominican Republic	1032	1,9	United States	2077	3,9
Spain	2490	4,6	Total	53860	100,0

Data collection tools

Within the scope of PISA 2015, teachers were asked their gender and whether they should participate in professional development activities (TC021Q01NA-Do you need to participate in professional development activities?). In the past 12 months, teachers have been involved in professional activities, were asked to participate. In the PISA 2015 report, not only data on students' academic achievements, but also data on teachers' professional development is included. Teachers are trained before and after the profession to contribute to their development. The data of the study was obtained from the questionnaires which were asked to the teachers within the scope of PISA 2015. In this research, teachers were asked questions about the following subjects. "Knowledge and understanding of subject field(s)", "Pedagogical competencies in teaching any subject field(s)", "Knowledge of the curriculum", "Student assessment practices, ICT skills for teaching", "ICT skills for teaching", "Student behaviour and classroom management", "School management and administration", "Approaches to individualized learning", "Teaching students with special needs", "Teaching in multicultural or multilingual setting", "Teaching cross-curricular skills", "Student career guidelines and counselling", "Internal evaluation or self-evaluation", "Use of evaluation results", "Teacher-parent cooperation"

Analysis techniques

In this study, it has been questioned whether teachers' participation in in-service training is related to gender and required. For this, Phi Coefficient coefficient was calculated.

Findings

Phi Coefficient coefficient was calculated to determine whether there is a significant relationship between teachers' participation in professional development activities as lifelong learning and their gender and the results are presented in Table 2.

*p<.05

According to the results of the analysis, there is a significant, albeit low, significant relationship between all domains and gender. When Table 2 is examined, it is seen that the relationship is mostly in favor of women.

To determine whether there is a significant relationship between teachers' participation in professional development activities as lifelong learning and whether they are compulsory or not, Phi Coefficient coefficient is calculated and the results are presented in Table 3.

According to the results of the analysis, there is a significant, albeit low, significant relationship between all fields and whether teachers are obliged to attend in-service trainings. When the table is examined, Student Behavior and Classroom Management, School Management and Administration, Individualized Learning Use of evaluation results indicates that teacher-parent cooperation is not involved unless participation is compulsory.

Results, Conclusions and Recommendations

PISA 2015 data were used in this study which examined the teachers' participation in in-service trainings according to gender and necessity. As a result of the research, it was seen that female teachers participated in in-service trainings more than male teachers. It is seen that the studies supporting this finding obtained in this study are in the literature. In the studies conducted by Gencil (2013) and Erdoğan (2014), it was found that female teachers had more lifelong learning tendencies. There are also studies in the literature indicating that there is no difference between lifelong learning and gender by gender (Arcagök and Şahin, 2014; Konakman & Yelken, 2014; Yaman & Yazar, 2015). In addition, Karasolak, Tanrıseven & Yavuz Konokman, (2013) in the study conducted by teachers in the in-service training tuutm tutu tutmaların was not changed according to gender.

According to the results of the analysis, there is a significant, albeit low, significant relationship between all fields and whether teachers are obliged to attend in-service trainings. In support of the findings of this research, Ayaz (2016) found a significant difference in lifelong learning tendencies according to the desire to participate in studies such as courses, seminars and symposia related to personal and professional development. It is concluded that this difference is in favor of teachers who want to participate in studies such as courses, seminars, symposiums related to personal and professional development. Moreover, the results of Atacanlı (2007) are consistent. Based on the results of both researches, it can be said that the desire to participate in the studies related to personal and professional development increases the level of lifelong learning or those who have high level of lifelong learning are more willing to participate in such studies and these studies are an important factor in the lifelong learning process. In addition, in the study conducted by Günbayı and Taşdöğen (2012), it was emphasized that the voluntary participation of teachers in in-service trainings was the most important factor affecting success.

Considering the effect of the steps taken by the teachers who have an important role in the efficiency of education on their academic and social success, it is thought that the detailed analysis of the data about the professional development of the teachers in the PISA 2015 report will contribute to the literature.

Abstract

Recently, the world has entered a rapid globalization process with the rapid increase of human population, the effect of modern culture on human life and the facilitating effect of technology. This process has a structure that permeates almost all areas of life. One of these areas is education. The aim of this study is to discuss the effect of cultural globalization on the education system. When the relevant literature on the effect of globalization on education is examined, it is seen that there are many studies pointing out the positive and negative aspects of this effect. The reason for the existence of both negative and positive views is the fact that the explanations are based on different globalization approaches. In this study, both positive and negative effects of globalization on education will be explored.

The current study was conducted as a literature review study. In the course of the research process, all resources, especially the basic resources, were tried to be reached within the framework of the questions determined on the subject. As a result of the review, the most prominent definitions related to globalization were discussed in the current study. The evolution process of globalization was also briefly mentioned. The effects of cultural globalization were discussed in relation to the effects of globalization on education. In this context, as a result of the research, it can be said that globalization creates its effect on education through many channels such as legal arrangements, cultural transfer and interaction. When the long-term effect of globalization on education is considered, it is clear that it can give rise to both positive and negative outcomes. The overall direction of interaction occurs from strong to weak, from big to small. Accordingly, it can be stated that the cultural values of developed countries are spreading more and more with each day. On the other hand, it can be said that the cultural values of the less developed countries are under threat and affected by the developed countries.

Key Words: Globalization, education, reflection

Introduction

In the steadily changing world, changes are experienced in many areas such as social, political, economic, health, education etc. These changes can be in favour of the development of humanity or against it. This shows that during the history of mankind, there have been ups and downs in the development of humanity. These ups and downs are sometimes manifested as wars, devastations and crises, and sometimes as discoveries and innovations. These ups and downs were sometimes temporary and sometimes created the feeling that they would last forever. Although the effects of these ups and downs seem to have been limited to the society where the events took place in the past, in fact it was observed that it spread from one society to another in the long-run because societies were relatively independent of each other and almost did not go beyond their borders. However, with the development of mankind, it is clear that the rate of spread of the effects of the events in the world increased. Towards the end of the 20th century, it is seen that the effects of events in the world spread more rapidly among other societies. Regardless of the nature of the event, it was seen to affect all societies in the world. Thus, as stated by McLuhan and Powers (2015), the world has become a small village.

The changes in the world create a wind effect blowing from one society to another and from one country to another. The effect of this wind is manifested in management systems as well as in the social life of societies. Countries' political, economic, health, education, etc. systems take their share from this wind. At this point, the

nationality of countries or systems is discussed (Kwiek, 2000; Kaymakçı, 2007). All these discussions show that it is suspected that national systems can survive against the global one (Hosseini, 2015). Therefore, it is appropriate and necessary to discuss what can be done to protect our management systems against the wind breeze of globalization.

Globalization has developed and strengthened in the same period with the nationalism movement. This situation can be seen in the processes of historical development. However, the basic assumptions on which they are based vary. Although this difference does not occupy a significant place in the lives of societies, its consequences have become a matter of survival for societies. Therefore, the idea of globalization is perceived as opposing the idea of nation-statism.

From the time when globalization began to make its presence felt, it has found many supporters yet also created its counter movements. This is because while there are many people taking full advantage of globalization, there are a large number of people who cannot benefit from it rather seeing it as a source of risks and threats. According to Kongar (2000), globalization has led to major changes in the economic, political and cultural fields and has been effective in the collapse of the nation-state structure.

In response to this dilemma of globalization, different groups have emerged making different interpretations of globalization. There are those who see globalization as an opportunity on the one hand, there are some other groups thinking that it increases inequality, suppresses national governments and threatens the world on the other. Since the education system is one of the basic systems involved in the country administrations, similar interpretations are made in relation to the education system. In this context, there is a need for studies to explore the effects of globalization on education systems. Thus, the current study intends to present a discussion of how education systems are affected from globalization, what is expected of these effects and why these effects are differently interpreted. In this connection, the purpose of the current study is to define globalization and discuss its effect on the Turkish Education System. To this end, answers to the following questions were sought:

- 1) How is the development process of globalization?
- 2) What are the effects of globalization on the Turkish Education System?
- 3) What are the reflections of cultural globalization in education?

Method

The current study was designed qualitatively according to the literature review method. According to Cronin, Ryan and Coughlan (2008), literature review can be defined as creating a comprehensive summary and critical analysis of the existing information produced about a specific subject. Throughout the current study, the following stages were followed. First, the concept of globalization and the development of this concept were examined. Then, its effects on the Turkish Education System were investigated and then the reflections of globalization in terms of its cultural dimension in education were explored.

The documents reviewed in the current study include scientific books, articles and reports. The reviews of the documents were conducted in 2018-2019. All the relevant reports, articles and books available to the researcher were subjected to the review. The concepts used to reach the resources to be reviewed are “globalization, history of globalization, cultural globalization and education”. As a result of the review, the resources reached on the basis of these concepts were classified under these concepts. The obtained findings were discussed in a manner

suitable for the purposes of the current study. For the sake of the unity of the subject, the discussions are presented together with the findings.

Findings

Globalization

It would not be wrong to say that anywhere in the world is now accessible. Any point in the world is more easily accessible than ever before, which excites individuals on the one hand and exposes individuals and societies to the influence of others on the other. Human beings called these expanding opportunities of accessibility and interaction which excited them as globalization. In this respect, globalization can be defined as the state of being exposed to the influence of geographically distant societies or forces. Giddens (2012: 60), on the other hand, defined globalization as the intensification of world-wide social relations that connect remote settlements in such a way as to allow local formations under the influence of international events or vice versa. According to the definition of Kartal (2016: 290), globalization is a phenomenon that develops as an expression of the ability to bring two distant points of the world closer to each other in many ways. With the concepts put forward for globalization, even the definition of the world has changed. With his book "The Gutenberg Galaxy: The making of typographic man" published in 1962, McLuhan first used the concept "Global Village". In his book, McLuhan (1962, 31) used the concept of global village in the following sentence, "Electromagnetic discoveries led to new relations in all human relations and these new relations are synchronous relations. In this way, people are now living in an environment of global village". When these sentences were written in 1962, there was no internet or digital platform. However, it was a time when the whole world was highly familiar with and widely used technologies such as TV, radio, telephone and telegraph. In this context, it can be stated that McLuhan used the term "global village" by considering the synchronous communication opportunities created by these technologies for human beings. This term of "global village" was used quite properly and this word has become smaller with each day and today even using the term "global cell" to define it would not be wrong. However, according to the comments made by Georgiadou (1995), while McLuhan put forward this concept, he considered the developments in human culture and that humanity moved to a new stage of culture, left behind the old stages and focused on written and spoken expressions therefore would make further developments in the future.

Globalization is one of the important concepts used in defining the contemporary world system. By its content, it is a concept that can be pronounced in every field of life. The main characteristic of this concept, to which good or bad meanings can be attributed from different perspectives, is that the globalizing thing has a structure that permeates many points on the world (Gözen, 2004: 70-71). According to Akın (2001: 77), globalization creates opportunities such as the development of economic, social and political relations of countries, better recognition of other societies and intensification of international relations. Gözen (2004: 71) defines globalization as a framework concept which brings plural actors particularly individuals, civil society sciences and economic actors and their multi-faceted relations to the fore from a pluralistic perspective. According to Timisi (2003, 105), with globalization, the interest of a homogeneous class having common social interests and a world view loses its importance, leading to the emergence of inequalities in income, wealth and power distribution. When all these definitions are evaluated within the scope of the concept, it can be said that the concept of globalization can be considered as a framework concept both sociologically and economically because the scope of the concept includes almost all dynamics that shape the world (Şen, 2008:148).

One of the most important issues in the globalization debate is the globalization – nation state debate. The cultural change brought about by globalization, the rate at which this cultural change is accepted by societies and the conviction that national cultures are degenerated for this reason disturbed many of the societies in the world particularly conservative masses because in the global village, many innovations and cultural exchanges pass from one society to another in a very short time and very easily. These cultural changes have found a strong acceptance in the minds of younger generations, but not at the same level in the middle-aged and elderly

generations. These cultural changes are even rejected by most adult generations. In other words, they do not find the same level of acceptance in the minds of the decision-makers who are in the position of making decisions about how young people should be raised. In other words, these cultural changes cause individuals who are in the position of making decisions to feel concerned. This is the basis of the cultural conflict between the two generations. In these debates, the prevailing view is that globalization is increasingly replacing nation-states, or that it poses a threat to nation-states. According to Hirst and Thompson (2000: 26), while national culture, national economy and national boundaries disappear in the face of globalization, many parts of daily life are shaped by active cultures spread through globalization. Seen from this perspective, those who advocate the necessity of the society to remain with national identity and live with national culture are concerned that they may be ineffective and inefficient in the face of active cultures. This state of concern has given rise to a counter-movement of globalization. According to this counter-movement, nation-states remain valid and need to be protected. According to Hosseini (2015, 2), it can be stated that the idea that nation states are still valid and this is necessary is more widespread.

The globalization process did not work in the same way for all regions and countries. The functioning level of globalization in a society is related to the level of modernity of the society or the level of interaction with other communities in the form of an open system. The more open the society is to interaction with other societies, the higher the potential of globalization to penetrate into it and to globalize it. The opposite is also correct. As a result, either positive or negative, the level of share taken from globalization depends on the level of effectiveness of the society among other societies. Thus, the extent to which the daily lives of individuals in the society are affected by globalization depends on the effectiveness of this society, because according to Giddens (2000: 15), globalization affects not only the events happening around the world but also the daily life.

Development Process of Globalization

The beginning of the globalization process can be taken back to very old times depending on the definitions to be made about the concept. If the definition of the concept is to be made as communication between people, tribes living in different regions or their being aware of each other, it is necessary to set a date for the beginning of globalization accordingly, but it will not be easy to determine this. However, if some certain criteria are determined to find a date for the beginning of globalization, then it can be more clearly determined. Wallerstein I associates globalization with the capitalist economic system and argues that globalization emerged in the 16th century. If associated with the discovery of new trade routes and geographic discoveries, then the history of globalization can go back to the 14th-15th centuries (Gözen, 2004: 85). The events that contributed to globalization up to the 19th century were generally the development of ship and gun building and communication and transportation technologies because through these developments, colonialism, missionary activities and commercial activities were carried out. The end of the 19th century and the 20th century were periods in which globalization progressed with leaps. There are some social and historical events that cause these leaps. The most important of these can be listed as the establishment of organizations such as the League of Nations and the United Nations. At the same time the establishment of IMF (International Monetary Fund), the World Bank, the First and Second World Wars, the emergence of the so-called Super Powers, the period of the Cold War and the collapse of the Soviet Union and the emerging states trying to be a part of the capitalist economic system are other developments that are effective (Gözen, 2004: 86-87). In other words, the important points in the logbook of globalization are those that deeply affect the global village and shape its future.

When we look at the history of the concept of globalization, it can be said that the word “global” has been known for a long time, but the use of globalization as a concept dates back to the 1800s (Naisbitt, 1994: Devrim and Altay, 1997; cited by Karabıçak, 2002:116). The concept, which gradually began to find its place in the 1950s, became a fashionable term in the language of everyone after 1980, when many issues were linked to globalization (Bauman, 1998:7).

Reflections of Globalization in the Turkish Education System

Globalization has affected the economy, politics and culture as well as the education system which forms the basis of all these and ensures the continuation of culture. The effect of globalization on education can be considered in two different dimensions because globalization affects the education sector in two different ways: direct and indirect. Globalization has a direct effect on educational activities because education is seen as a tool for the creation of workforce with global culture, thinking and approaches. In this sense, goals such as creating a culture that is open to innovation, competition-oriented, multicultural and is based on collaboration within the group have been adopted by almost all education systems in the world. In addition, the transfer of behaviours and skills complying with these goals to new generations is among the main objectives of today's education systems. Seen from this perspective, education is a solution for countries in order to survive in the competitive environment in the field of globalization because the training of the required human resources both quantitatively and qualitatively depends on education. Globalization indirectly affects educational activities, because globalization affects the economy, politics and culture of the country. Education is also changing indirectly due to changes in the fields of economy, politics and culture, and their dynamics that permeate all areas because education has a structure that serves as a source to all other areas and having something to do with all other areas.

The financial fund systems (IMF, World Bank) established under the leadership of the major world states are the systems that are intended to provide visible support to the member countries experiencing economic problems. However, most of these funds are provided by big states such as USA, UK, France, Japan and Germany. These states, which have the power and privilege to provide funds, have the privilege to influence the funding institutions as well. These funding institutions, which are largely financed by powerful sovereign states, have become the channels of application of the global market idea that the countries they receive funds from want to form in the world. These powerful states have begun to impose sanctions on states wishing to borrow from the fund to serve their own purposes. The sanctions imposed were mainly imposed on countries with poor economic conditions in order to pave the way for the global circulation of capital and to create markets in the global order. Some of these impositions were the works that paved the way for privatization. Today, the scope of privatization is not limited to financial or industrial institutions. It has penetrated into the service sector and even to national education systems.

Globalization entered the Turkish Education System in the 1980s through the concepts of localization and privatization and has been effective in the system since then. Then it started to dominate the system by highlighting the inadequacies of the current education system. First of all, with the arguments that the central administration system could not adequately respond to the education needs of the public, the classes were crowded in schools, there was a lack of necessary physical facilities, and the performance of teachers and other employees was poor, it was suggested that privatization would be beneficial in the education sector. After that, with the privatization, the idea that quick solutions to problems could be found through the local management structure of education resulting from privatization was promoted and thus education was opened to the global market. Together with privatization, education has been transformed into a commodity that can be bought and sold globally if desired (Kocabaş and Yirci, 2013: 1526-1527).

The concept of globalization affects living spaces in many ways and in many respects. Accordingly, its effects on education may also develop in different ways. The effects emerging in different ways and forms make up a complex phenomenon. In order to understand this phenomenon more easily, it is necessary to analyze how this effect occurs in the main areas where it affects life. In the current study, the effect of globalization on education from the cultural dimension was examined.

Reflections of Cultural Globalization in Education

The effect of globalization on culture is closely related to the education sector. When national education is considered, national culture is seen as both an end and a means. It is seen as an end because one of the functions of education is the transfer of national culture from generation to generation. It is seen as a means because the school uses national culture to maintain the school system and to perform other functions of the school. The effect of cultural globalization on education is also seen on curriculums. The main reason for this is the change in business areas. According to Balay (2004), globalization has abolished existing employment areas and brought new employment areas. In this context, globalization improves the developed countries, which are seen as the locomotives of globalization, and adversely affects the underdeveloped countries that have already lagged behind. For this reason, underdeveloped countries need to turn to emerging professions in order to educate their labour force and they have to provide more appropriate training for this to occur. This requires new curriculums and new approaches. Since all innovations are first seen in developed countries, underdeveloped countries have to follow these innovations from behind and be dragged after the developed countries. This makes the education sector in the underdeveloped countries no longer national, or makes it more difficult to maintain the nationality of their education sectors. Özdemir (2011) states that countries should change their education systems and education programs to adapt to new changes that emerge as a result of globalization and that society should change and develop in the direction of national and international values and qualities for a healthy change.

However, given that the change brought about by globalization is continuous and an endless wave, it is inevitable that international values will prevail over national values with each day. Çalık and Sezgin (2005) see this as a threat to education programs. Therefore, it causes the society to feel that their culture is under threat and to lose confidence against other cultures because the weaker in this situation is doomed to extinction. Leaman (2009) states that this is one of the negative aspects of globalization because at the end of this process, it can be concluded that there is a tendency towards a single education program and model in the global village. In this way, the implementation of a single form of education in all countries and the existence of a single culture may mean the destruction of cultural values of societies, especially those of less developed countries. Although this danger is a visible danger, many countries nowadays tend to adopt practices that support this process of their own free will. For example, attempts made to change the education programs of Turkey to improve the ranking of Turkey in PISA exam from which it has been taking low scores can be given as an example in this regard.

A group called “transformists” who believe that globalization will bring a new order to the social, political and economic systems of countries all around the world, and thus the world order will have a new function, is looking at globalization from a different perspective and evaluating this change in national culture differently (Bozkurt 2000: 24). Transformists approach this change in national culture positively and see it as development. Güven (1999) states that globalization involves important opportunities and one of these opportunities is that through globalized educational-instructional programs, more international and therefore intercultural interaction is possible. In this regard, in many developing countries including Turkey, greater emphasis has been put on multiculturalism and global approaches to education in their education programs. However, it is stated that Turkey is just at the beginning stage. According to Korkmaz (2017), the research on globalization in Turkey is very little and the effects of multiculturalism and global approaches to education on educational programs in Turkey were observed to be very weak. Therefore, the importance of multiculturalism and global education in education programs should be emphasized more and new objectives and class activities should be added to them to support globalization. In addition to this, new courses should be added to the curriculums of education faculties in order to train pre-service teachers to better deal with the issue of globalization. Many people are aware of the need for revising curriculums, thinking that this is important for development. In this connection, Singh (1996) states that education systems are stuck between globalization, access to information and

multiculturalism and protection of national values. Turkey is making efforts to integrate with the European Union to seize this growth opportunity. Thus, it conducts student exchange programs with European Union countries.

On the other hand, it is stated that it is possible to be protected from the negative effects of globalization. According to Özdemir (2011: 100), education programs have an important function to serve in this regard. It is a negative situation that other cultures put pressure on national cultures or cause changes in the attitudes, behaviours, beliefs and lifestyles of young generations. This effect is felt more deeply by developing countries such as Turkey society. With globalization, there are concerns that the values system has been dissolved, that national values have started to degenerate or have been subjected to change. In this context, it is possible to alleviate these concerns by enhancing the functionality of educational programs.

Globalization can create opportunities for knowledge, technology, social values and behavioural norms. It can affect the development of individuals, organizations and societies from different countries and cultures at different levels (Bakhtiari, 2011: 96). New economic structures or globalization can create a new culture or change the existing culture by affecting it more or less. With globalization, people's life experiences will begin to show similarity, because it is inevitable that similar causes will have similar results (Talas and Kaya, 2007). Technological systems that penetrate into the deepest levels of life are one of the accelerators of this cultural globalization because technological developments that accelerate communication and make life similar with the use of similar technologies lead to similar lives. In recent years, the use of a global common language has become important with the increase and ease of international communication through technology. This common language which is spread over technology in general is the carrier of culture and thus humanity has entered an intensive process of acculturation. This is one of the elements accelerating cultural globalization. The fact that information is generally shared over a common language and that it is easily accessible through technology has turned the direction of education towards teaching people how to access information rather than transmitting information to them. Educational environments are tried to be transformed into environments where children can think, do research and discuss a number of issues. Encyclopaedias were replaced by computers and the Internet through which more interactive activities could be carried out. In addition, besides activities directed to the development of verbal and numerical intelligence, visual, kinaesthetic and rhythmic activities have been incorporated into curriculums. Instead of inculcating the information that is thought to be used in the future, students are taught how to reach this information. In addition, learning is now seen as a lifelong activity. Thus, adult education and in-service trainings have gained greater importance (Balay, 2004: 67). The cultural globalization that triggered the change has brought about the need for school administrators and teachers to update their methods and techniques in the field of education. This has also been emphasized in the Turkey's 2023 vision document issued by the Ministry of National Education. It is stated there that there will be studies to support the postgraduate education of teachers and administrators.

In the education system, some arrangements have been made to ensure international student mobility. Turkey has been involved in the Bologna process in an active way to actively use this student mobility system. Within the scope of the Bologna process, qualification and quality systems have been established in order to achieve diploma equivalence in other countries. Turkey manages the mobility of approximately 15 thousands incoming and outgoing students (YÖK, 2019). This is a reflection of globalization in education because this mobility includes a global circulation and sharing of culture and human capital.

Conclusions

Globalization refers to a similarity movement in the world, which can be interpreted as good or bad when viewed from different points. This similarity movement is supported by the financial structure and is in cooperation with technology. In other words, the fixed and expected result of globalization in general is that globalization will

reveal similarities at many points around the world, because globalization has a structure that facilitates the movement of capital and causes the market to be liberated.

Globalization has emerged as the globalization of economy and the globalization of politics and culture in ways that affect each other. In the globalization of economy, the mobility of capital and the weakening of economic boundaries come to the fore. In political globalization, countries have similar policies in order to address the markets. As in other countries particularly in the ones strongly influenced by globalization like Turkey, globalization has significant reflections in the education system. This was also stated by Zajda (2016). Cultural globalization is the emergence of similar cultures with the triggering and dispersing effect of technology. As a result, people from different regions of the world tend to have similar food consumption culture and to show similar behaviours.

The reflections of globalization in the education system emerge as privatization and localization in education because privatization makes education open to the market and influences of other educational cultures in the world. In addition, student exchange programs are the result of globalization. With the student exchange system, the way of transferring human capital to different countries has also been opened. In order to ensure diploma equivalence, efforts have been invested to match the programs of universities in different countries. Therefore, Turkey has been involved in the Bologna process. This is another reflection of globalization in education.

Basically while the nations benefiting from all the blessings of globalization define globalization as good, the nations not making any use of the outcomes of globalization and even harmed by it define it as bad. Almost all innovations in the world are introduced by developed countries and exported to less developed countries. As in every field, this is also true for education. However, the innovations and developments in the field of education threaten societies' national cultures and values. Furthermore, those who argue that there is and should be an extreme globalization accept that this wind of change and transformation is blowing from developed countries to less developed ones. Moreover, these extreme globalization supporters also state that this international interaction should occur and for this to happen, globalization is the only valid and inevitable way. It is a natural reaction that the underdeveloped countries feel themselves under threat and risk of extinction. In addition, globalization operating in this way carries the risk of dragging the whole world to a single type of humanity with each day.

Abstract

The main purpose of the study is to research and evaluate the processes that have arisen in the development and improvement of the training of professional accountants and auditors, as well as recommendations for improving the efficiency of their work. The use of the progressive accounting technologies, including the automation of similar processes, reduces the time needed to create information in accounting. In the new conditions there is a need for the ability to assess the risks arising from the development of automation. Requirements for carriers of the accounting profession in these conditions are changing. It becomes imperative to work in standard office and special accounting programs at the level of a confident user and quickly adapt to changes in software. Therefore, continuous professional development of professional accountants is one of the prerequisites in Azerbaijan. In the conditions of development of automation, the need for building and maintaining a system for controlling the formation of information at each stage of the accounting process is importance for the accountant. The control system should identify the compliance of the result with the requirements of legislation, accounting policies, formal logic and common sense. The key role in this control system is assigned to a person who must have a systematic understanding of accounting theory and practice. The practical significance of the study can play a positive role in enriching the scientific and practical knowledge of experts involved in accounting and reporting. Continuous professional development, development of new knowledge and skills becomes objectively necessary. The professional education of accountants should be continuous throughout the professional career. It is necessary to develop the acquired competencies within the framework of additional professional education and self-education.

Key words: financial statements, accounting, auditing, misstatements, automation.

Introduction

Discussing the problems of accountability and transparency, one cannot overlook such an important element as professional qualification and education of profession holders - accountants and auditors. It is from the basic training of specialists, whose main task is to compile and confirm the reliability of reporting, which determines its quality.

The accounting and auditing professions are closely interrelated: the accounting (financial) statements, which is the result of the accountant's work, become the starting point for the auditor's activities. The ultimate goal is to provide society with reliable information on the financial position of an economic entity, the financial result of its activities, which are necessary for users to make economic decisions. There is an opinion that accountants and auditors form one profession. Without going into the details of this discussion, which is quite dramatic in some audiences, we note that the following fact is beyond doubt: the auditor must know accounting, and must know it well, even perfectly! (Bychkova, S.M. and Itygilova, E.Yu., 2007).

In practice, the same teachers train the accountants and auditors. Therefore, excluding some nuances, it can be stated that the problems caused by deficiencies in the training of accountants and auditors are very similar. Thus, considering the training of specialists in the field of accounting, we, at a minimum, identify problems in the training of auditors.

Professional activities of accountants and auditors are inextricably linked with changes in the economic sphere. In the conditions of rapid development of processing and information exchange technologies, the company is waiting for accountants to shorten the time frame for submitting reports and reduce the cost of preparing them while maintaining the quality of the reporting information. This cannot be achieved without increasing the

intensity of accounting work. The use of progressive accounting technologies, including the automation of similar processes, reduces the time needed to create information in accounting.

One of the areas of introduction of information technology in Azerbaijan is the widespread use of electronic documents by economic entities. The result of its use was the integrated automation of such labor functions as the acceptance for accounting of primary accounting documents, the monetary dimension of accounting objects and the current grouping of facts of economic life.

Automation is one of the tools to achieve the goal of accounting as a type of professional activity. In this case, the total set of labor functions that determine the profession of an accountant does not change. Only the way they are performed changes. As a result of automation, labor is redistributed from person to machine. Routine, one-type actions are performed by the machine. A person performs logical, control and analytical actions.

Methodology

Scientific articles, monographs and other information of domestic and foreign economists on the problems of accounting, economic analysis and fundamentals of the theory and methodology of auditing, normative, methodological and methodical materials were the theoretical basis of the study.

The practical significance of the study can play a positive role in enriching the scientific and practical knowledge of experts involved in accounting and reporting. Continuous professional development, development of new knowledge and skills becomes objectively necessary.

Requirements for carriers of the accounting profession

Requirements for carriers of the accounting profession in modern conditions are changing. For example,

- It becomes imperative to work in standard office and special accounting programs at the level of a confident user and quickly adapt to changes in software products;
- Continuous professional development, development of new knowledge and skills becomes objectively necessary. For accountants, unlike auditors, it is not legally enforced and is determined by the requirements of employers. Therefore, continuous professional development of professional accountants is one of the prerequisites in Azerbaijan. In the new conditions there is a need for the ability to assess the risks arising from the development of automation.

One of these risks is the possible loss by the accountants of a part of their professional skills, the loss of professional qualifications, which will entail a decline in the quality of their work.

Today, in the public consciousness, the cult of the machine's superior capabilities over human capabilities is being formed. A person absolutely trusts the results obtained in an automated way. As a result, often accountants do not have the ability and do not consider it necessary to check and analyze accounting information, which has a negative impact on its quality. However, we should not forget that the use of automated technologies in the accounting process does not relieve the accountant from the responsibility established by law for the distortion of reporting information (ACCA. F8 Audit and Assurance, 2017-2018). Thus, in the conditions of development of automation, the need for building and maintaining a system for controlling the formation of information at each stage of the accounting process is importance for the accountant. The control system should identify the compliance of the result with the requirements of legislation, accounting policies, formal logic and common sense (Deloitte development LLC, 2010). The key role in this control system is assigned to a person who must have a systematic understanding of accounting theory and practice.

For auditors, this problem is transformed into the mechanical filling of working papers and tables without analyzing the results. This is a necessary and voluminous work, but it does not require high qualification, which

can “teach” the auditor to draw conclusions automatically, without conducting the necessary analysis, without delving into the essence of a specific audit. The existence of this problem is complained by the auditors themselves in different countries. Summarizing, we can say that in cases where an employer, wishing to choose a better candidate, requires a higher qualification from an applicant, “in reserve”, if it can be expressed so, but then does not provide him with an appropriate level of work, the qualification of the employee is lost.

According to the report on the results of the activities of the chamber of auditors of Azerbaijan Republic for 2017, 45 independent auditors, 67 audits of (including representations and branches of 2 external auditor organizations and 15 auditor organizations that uses a trademark of foreign legal entities) the authority to carry out an audit activity. By the 45 independent auditors and 77 auditing organizations presented the report on the activity of the Chamber of Auditors. According to the report, it was found that, during the reporting period, 4826 contracts were signed in the amount of 53 626 060 manat provided with businesses entities. The relative share of concluded contracts as for Big Four number 10,8% and as for the amount 68,2%, as for the number of audit firms that use trademarks of foreign legal entities 10,1% and as for the amount 19,4%, as for number of local auditor firms 55,7% and as for the amount 8,3%, as for the number of independent auditors 23,4%, and as the amount 4,1% (Report on the results of the activities of the chamber of auditors of Azerbaijan republic for 2017). Another aspect of the topic under consideration is that over the past decades the very content of the profession of an accountant has changed qualitatively, which causes the need for changes in the system of its professional training.

A modern practicing accountant is a multifaceted specialist, possessing professional competencies of a number of related professions (financiers, economists, lawyers, etc.), able to assess risks and predict the impact of any fact of economic life on changes in the financial position of an organization prior to its completion. One of the important aspects of the professional life of a modern accountant is his knowledge and application of professional ethics (Sitnov A.A., 2017).

The basic part of professional competencies and the future accountant, and the future auditor are obtained in an educational institution where the foundations of independent professional thinking, professional responsibility and relationships should be laid. In this situation, the role of vocational education cannot be overestimated. First of all, a graduate must have a systematic understanding of the subject of his activity, understand accounting information in all its fullness and variety of internal relationships.

The Department of Accounting and Audit of the Azerbaijan State Economic University (UNEC) has a huge experience in the preparation of bachelors, masters, doctoral students in accounting. Specialists who have completed higher accounting education at UNEC, including doctoral students, work in all sectors of the economy, in the scientific and pedagogical field, many of whom have excellent professional skills. Today, according to specialists, there is a great demand in the labor market for specialists who graduated with a degree in Accounting and Audit, the need for which will continue to grow as business management becomes more and more complex and requires a scientific approach. The increase in the scale of managerial tasks facing the management in modern conditions requires further improvement of educational and professional accounting standards in accordance with the requirements of the labor market.

As practice shows, modern graduates are difficult to adapt to specific working conditions, do not know how to work with regulatory documents, apply them in practice, independently find informed solutions in controversial situations, develop internal organizational and administrative documents, including accounting policies. Therefore, it is difficult for them to develop creative abilities, without which there is no real professionalism. Another part of professional competencies can be obtained only in real, not training or model conditions, it is acquired through the development of its own experience, including the experience of professional relationships with management, subordinates, with external contractors. For example, young professionals, as a rule, it is

difficult to act as a leader, even of a lower level. Their knowledge of accounting management does not go beyond the basics of general management. Therefore, the lack of minimal professional competences in the field of accounting service management is currently a problem.

Thus, the improvement of technology training should include, on the one hand, an increase in the time of practical exercises aimed at the development and consolidation of skills. It is necessary to use various forms of practical training. At the same time, priority must be given either real or model, but as close as possible to the real conditions of practical activity.

On the other hand, it is necessary to qualitatively change the theoretical training, preferring the accounting and analytical disciplines. The teaching of these disciplines should be systematic, providing students with an understanding of the causal relationships in the accounting process and the methodological foundations of information disclosure reporting. In addition, accounting disciplines should be more comprehensive, incorporating features of various sectors of the economy, including the public sector. Teaching analytical disciplines should bring up not a mechanical application of financial position assessment tools, but an informed choice aimed at assessing the continuity of an organization's activities in the foreseeable future.

On September 2, 2004, the Law on Accounting was adopted, thanks to which Azerbaijan approved the main package of regulatory acts governing the activities of accounting entities on the application of new financial statements. In accordance with the Law, all commercial organizations equal to socially significant structures are obliged to apply International Financial Reporting Standards (IFRS), and other commercial enterprises with the exception of small business - apply National Accounting Standards on the basis of IFRS since January 1, 2008. At the same time, municipal bodies, state-financed organizations and extra-budgetary state funds are required to apply National Accounting Standards in accordance with the International Public Sector Accounting Standards (IPSAS) starting January 1, 2009. To ensure the set of measures for the application of the Law on Accounting, by Decree of the President of the Azerbaijan Republic of February 7, 2005, the Ministry of Finance was entrusted with the authority to exercise state regulation in the field of accounting. The main objective of this regulation is the development of a set of measures to coordinate the provision of coordinated actions for the presentation of more transparent and high-quality financial statements by accounting entities prepared on the basis of financial accounting and compliance with international requirements. In connection with recent significant changes and additions made to the Law of the Republic of Azerbaijan "On Accounting", the problems of the planned implementation of International Financial Reporting Standards to strengthen the legal basis of accounting in Azerbaijan, form the necessary institutional mechanisms, and align systems of training and professional development of accountants (The Law of the Republic of Azerbaijan "On Amendments to the Law of the Republic of Azerbaijan "On Accounting", May 04, 2018).

Since 2004, i.e. since the adoption of the "Law on Accounting" in Azerbaijan (prepared with the direct participation of the World Bank), which prescribed a mandatory transition to the accounting and reporting system in accordance with International Financial Reporting Standards (IFRS), reform in Azerbaijan is implemented at a very high rate. The transition to IFRS is carried out under the leadership of the Ministry of Finance of Azerbaijan and with the active participation and financial support of the World Bank. In particular, the project "Corporate and Public Sector Accountability Project", funded by the Government of Azerbaijan together with the World Bank, as well as with the participation of the Secretariat of Switzerland and the Government of Japan, has been launched today.

The work on the translation of IFRSs according to the version of 2011 into the Azerbaijani language, as well as on the approval of these translations as official texts in the Fund of the Committee on International Accounting Standards; translated 32 International Public Sector Accounting Standards (IPSAS); translated IFRS for Small and Medium Businesses, according to the version of 2009; "Collection of international standards for quality

control, audit, review, assurance and related” has been translated, (Part 1,2) according to the version of 2012; translated International Education Standards for professional accountants according to the version of 2010;

37 National Accounting Standards for commercial organizations were developed and approved on the basis of IFRS according to the 2011 version, and Comments and recommendations on the implementation of approved standards for commercial organizations were developed and approved; 32 National Accounting Standards for budgetary organizations and extra budgetary state funds, as well as 1 National Standard for non-governmental (public) organizations in accordance with the International Public Sector Accounting Standards (IPSAS) were developed and approved; a program for the transition to IFRS for structures of public interest has been developed and approved; developed and approved rules for the provision of financial statements, as well as approved the reporting period for commercial, budgetary, non-governmental and municipal organizations.

In the course of an audit, the auditor should obtain sufficient audit evidence about the acceptability of the quantities available for quantification and the accuracy of their calculation in the financial statements. Experience with auditing shows that finding evidence that corresponds to quantitative measures for comparative quantities is relatively complex and can rarely be unambiguously interpreted compared to evidence supported by other items in the financial statements. In our opinion, when checking the performance indicators, the auditor should observe the following sequence:

- general and detailed review of the procedures used by the management of the audited entity to assess performance indicators (taking into account their assumptions). If credentials are used, they must match each other and not contradict other statistical information. At the same time, the results of previous periods should be compared with the actual results of the reporting period, and the documentation of the calculations should be analyzed by the management of the audited entity, as well as by the procedures for the approval of estimated indicators;
- subsequent events, including events that occurred after the reporting, should be checked in order to confirm the correctness of the performed calculations. Thus, events and operations that occurred at the end of the reporting period, but before the completion of the audit, can be used as evidence of performance indicators calculated by the management of the audited entity.

In our opinion, when evaluating performance indicators at the final stage, the auditor should determine the degree of assessment of the use of analytical procedures. For this purpose, it is advisable to use an analytical coefficient (C^{aa}) of performance indicators, which can be calculated using the following formula:

$$Caa = \frac{\sum C^{AP} T^{AP}_I}{\sum CD^{AP} T^{DAP}_I}$$

Here C^{AP} - the number of analytical procedures used in the audit of performance indicators; T^{AP}_I - the amount of time spent on conducting analytical procedures; CD^{AP} - the number of other audit procedures used in the audit, other than analytical procedures; T^{DAP}_I - shows the amount of time spent on other audit procedures (except for analytical procedures).

One of the most important and responsible aspects of auditing is the evaluation of the performance of its management and the ability of the enterprise to continue its activities. The likelihood of continued operations is one of the fundamental principles for preparing financial statements - ISA 570 “Going concern”. The auditor to assess the likelihood of continuous continuation of the enterprise, it is advisable to use financial, operational and other mandatory and relative indicators (such as repayment ability, circulation of current assets and diagnosis of the probability of insolvency).

The business valuation methodology involves the use of three approaches — income, comparison, and cost methods. In our opinion, when calculating the value of a business, it is recommended to use the following formula:

$$PV = \sum_{i=1}^t \frac{CF_i}{(1+DR)^i} + \frac{FV}{(1+DR)^t}$$

Here PV is the (business) current value; CF_i - period income i; FV - increased cost; DR - discount rate; t is the last year of the forecast period; i - indicates the number of the forecast period.

The main purpose of accounting and financial reporting is to identify the facts of distortion in accounting and financial reporting, as well as assess the impact of distortion on financial performance. Two important aspects of the auditor's activity in ISA 450 "Evaluation of misstatements identified during the audit" are the effect of the errors found on the auditor's opinion; the impact of unreliable errors (if any) on a company's financial statements. The study showed that the distortions are mainly related to financial results, resources and tax payments (reduction of profits due to artificial reduction of income and seizure of assets). Grouping fraudulent financial statements allows you to select and apply the analytical procedures used to identify them. To solve this problem, it is advisable to use the "Map of the normative payments of financial indicators", prepared by professor W. Bennis.

Results, Conclusions and Recommendations

The professional education of accountants should be continuous throughout the professional career. It is necessary to develop the acquired competencies within the framework of additional professional education and self-education.

At the sub-accounting level, it is possible to note the compilation, recording of initial documents, processing of register data and conclusion of business results. A higher level includes the compilation of financial (accounting) statements, tax accounting, cash management, and financial analysis issues. According to the expert according to the criteria, mentioning the importance of labor functions in each level (sub-level) can help to get a clearer picture of each level. It is impossible to demand that all economic entities immediately follow the criteria, this can lead to undesirable results. It is no secret that, with accounting, especially on business entities there are serious shortcomings. If one can put it this way, tax accounting harassing accounting has come forward. But the last performance of the new leadership of the Ministry of Taxes and recent actions of the Ministry of Finance gives the first signals that, starting next year, serious steps will be taken.

In Azerbaijan, there are many competent and experienced accountants who know the new standards, but in any case, every accountant must have the knowledge and experience corresponding to his job functions, and applying the highest standards to all is wrong. Since January 1, 2010, the auditor has implemented international audit standards.

In large organizations, as a rule, there is a more detailed division of labor, and an accountant objectively cannot be a broad-based specialist. However, the work of the chief accountant in a large organization has its own specifics, which determines the increased qualification requirements for a specialist. Specificity is:

- to expand the powers and responsibilities of the chief accountant in connection with the increase in the scale of activity of the economic entity;
- the need to solve more complex problems of organizing the formulation and maintenance of accounting and the preparation of accounting (financial) statements;
- the need to ensure a unified methodology of the accounting process.

Peculiarities of State Funding Priority Educational Programs and Expense Efficiency

George ABUSELIDZE¹

¹ Batumi Shota Rustaveli State University, Department of Finance, Banking and Insurance, Georgia
Email: george.abuselidze@bsu.edu.ge / abuseri@mail.ru

Abstract

Education is an important priority for the country, that should be given special importance and attention. It defines country's progress and economic advancement. High quality education is a guarantee of social consolidation that promotes welfare and personal, social and professional development. All this can be achieved by rational use of state financial resources. In order to evaluate the efficiency of the expenditures incurred by the state, it is necessary to examine the segment of the funding. The objective of the topic is to identify the major shortcomings in the existing higher education funding system and to provide ways and directions to solve problem. All of this is discussed by the analysis of international practice, which is based on experienced and established approaches in time, because higher education financing is not limited to the extent of financing, but also the social environment, which is historically established in a particular state or region, so this research should be carried out by considering the profound and compelling factors. Analysis of international practice illustrates the deficiencies in Georgia in this regard. Higher education and financing in Georgia are very small and far behind the international standard. The increase in financing can not itself be considered as a step forward if we can not determine the acceptable results, which should be based on systematic monitoring of the labor market.

Keywords: Higher education, Funding models, Human capital, EU, Georgia

Introduction

In the modern stage, the higher education system of any country should be based on the country's welfare requirements, While its priority directions should be financed based on labor market analysis. 145,494,763 GEL is spent from the state budget 2013-2018, for the priority directions (agricultural sciences, education, engineering, natural sciences, social and humanitarian sciences) defined by the Higher Education Policy of Georgia. It should be noted that the number of those enrolled in the state-funded priority educational programs in Georgia is growing every year (Fig. 1).

Figure 1: Number of enrolled students

Source: It is drawn up by authors, based on the data of the Ministry of Education

However, the necessity of growing flows of philologists, chemists, archeologists, and even economists are still controversial. Of course, several questions arise about this topic: How much the current funding model is oriented on the state priorities and the labor market. More so that the standard demands of the program budget-evaluation of the implemented programs and formation of assessment indicators, are not yet implemented.

The purpose of the work is to assess the efficiency of funding priority directions, analysis of achieved results, efficiency of evaluation indicators and the compatibility of the priority directions with the labor market requirements.

Methodology

During the research process we used qualitative and quantitative methods of data collection. The legislative acts were also studied and analyzed. By using the stratified method we selected one of the highest rated Georgian university and we started to analyze documentary information and database. Based on graduates survey we calculated Public IRR. In the higher education system of different countries, the public IRR is used to measure the benefit of the economic aspect. IRR is the ration between the expenditure incurred by the state on higher education and the estimated revenues from employment. As a rule, such expenses of the state should be profitable in the long run. In particular, people with higher education will be employed on higher income positions and thus will be able to mobilize more budgetary income in the form of income tax. The methodology selected by the Organization for Economic Cooperation and Development (OECD) has also been used:

$$IRR = \sum \frac{\text{Future income}}{\Sigma(1+r)^t} - \text{Initial investment, Where}$$

Future income corresponds to the salaries of the graduates, until the retirement age. The employment rate is 42.3%; Average salary is 895 GEL (National Statistics of Georgia, 2019); The percentage of employees employed by their profession is X%; r - interest rate; t% which reflects the level of inflation in the country (target) t = 4,3; The initial investment involves the expenditure incurred by the state for 4 years (program funding + grant).

Literature Review

Since the state is the largest investor in the education system, the investment in education should bring benefits. According to Abuselidze (2019) the economic relevance of the profit should be social reversal, in which we mean the rate of the expenses incurred by the state to higher education with the estimated revenue received from employment. This coefficient determines the efficiency of investments on education by the state. For the purpose of spending (Abuselidze, et al., 2018) product funds effectively, it is reasonable to change the funding model.

Taking into consideration international practices, criteria should be elaborated, which will take into account the qualitative indicators and the number of students in granting financing to higher education institutions. The Organization for Economic Cooperation and Development (OECD) in the study "The Importance of Higher Education for the Educated Community" presents the models of higher education system introduced by European countries, analysis of financing and monitoring system used by various states. In the study "Higher Education Review" it is analyzed the measurements of higher education achievements and benefits connected with economic perspectives in different states.

Also, In the European Commission survey "Funding of higher education" it is analyzed the model of determining the number of directions and students financed in the Higher Education System of the Czech Republic and Germany This country represents a specific and peculiar case for studying due to the fact that it is profound in higher education as well as excels in economic performance (Hüther & Krücken, 2018). There are a number of studies that deal with the education as a form of return on investment in human capital (see e.g. Blanchard & Olney, 2017).

According to volchik et al. (2018) in a situation when the globalization of the markets and localization of science related industries make tertiary education vital for economic well-being of the countries, the interdependence between the tertiary education and economic performance becomes apparent. As economic growth becomes more dependent on high-technology industries universities get function of main source of the R&D-based growth (Guerrero et al. 2015; Marozau et al., 2016; Fägerlind & Saha, 2016).

According to the Basic Data and Directions Document (BDD) of 2019, the state model of higher education financing is focused on strengthening the directions and specialities that are related to the development of the country and strengthening of the social life and Country's economy (BDD, 2019, p. 38). According to the Resolution of the Government of Georgia (N167), supporting the development of higher education system is important for the effective functioning of the labor market, stimulating employment and reducing unemployment (State Strategy on the Formation of Labor Market of Georgia, Article 3, Paragraph 3.5). The purpose and amount of granting of software financing on higher education institutions is regulated by the Ministry of Education and Science of Georgia (Order 79 / N., June 24, 2013).

Research

Funding of higher education can be mainly from two sources: 1) State Budget Funding (State Grant); 2) Private funding (co-financing) (Abuselidze et al., 2017, p.). In both cases the purpose of financing should be the development of priority software directions and the promotion of targeted use of intellectual potential. According to the program (state) budget and the calculation of the financing of the priority directions the annual funding of each priority program was up to 33,750 GEL by 2017, and it was accredited by 15 students enrolled in the university, and after each of the 15 students, for each of the 6 students 11250 GEL was distributed annually. As a result in the 2013-2017 academic year 145,495 million GEL was spent on the priority programs of higher education, where the cost of program financing is 129,534 million GEL and state education grants is 15, 960 million GEL (Fig 2).

Figure 2: Funding of the priority programs

Source: It is drawn up by authors, based on the data of the Ministry of Education

Since 2017, as a result of the modification of the funding model, it is inadmissible to fund the full scholarship of students with state education grants. In particular, if the student enrolled in the undergraduate educational program received a part of the state education grant within the program funding, his tuition fees will be filled up to the amount of tuition fees determined by the university, but no more than 2,250 GEL. (Order No.135 / n of the Minister of Education and Science of Georgia - "On Approval of the Rules and Conditions of Issuing Program Funding for Higher Education Institutions by the Ministry of Education and Science of Georgia in the 2017-2018 Academic Year").

Over the last decade, about 70% of the total budget of the state higher education institutions in Georgia is complemented by students and their families as a tuition fee, the rest 30% is provided by the state. While in the developed countries this indicator is the opposite- Approximately 70% of the state budgets are financed by state funds and 30% from other private sources.

3.1 Priority Programs Planning Models: Problems and Prospects

Development of priority directions for education in post-Soviet countries and especially small economies countries are the most difficult causion. According to the Fiscal Framework of 2017 the definition of higher education priority directions and the basis for financing is the labor market analysis. According to the EU practice, priorities in higher education system are tailored to the needs of the country. In particular, for the effective functioning of the labor market, the growth of employment and the reduction of unemployment is necessary to support the development of the higher teaching system. For example, in the Baltic countries, during the determining the priority directions public requirements and interests of the country are taken into consideration. (The Strategic Plan for the Scholarly, Scientific, Research, Development and Innovation, Artistic and Other Creative Activities of Higher Education Institutions for 2016–2020, pp.15-19).

During the process of determining the priority directions in Georgia, it is very difficult to determine the convergence between higher Edukation directions and country needs. When at this period there is no proper research of the labor market in the country. Therefore, the compatibility between the priority directions and labor market requirements is not proven and it disagrees with EU standards. The reason for this shortcomings is in our opinion that there is no mechanism according to which the priority direction presented by the university will be assessed. Time by time the risks are rising that the direction chosen by the higher education institution is not adjusted to the country's goals or the requirements of the labor market.

These challenges include the increasing cost of education, government policy and regulation covering issues such as standards and financial aid, lack of adequate financial resources, lack of physical infrastructure (Drape et al., 2016), depreciating value of the college degree, technological changes, lack of alignment of curriculum and university agenda to the demands of the labour market (Sharma & Sharma, 2015), and the role of extra-curriculum activities in education (Ramaley, 2014).

To illustrate above mentioned we implemented a comparative analysis of the number of students financed by the Ministry of education and the number of problematic job opportunities for the labor market.

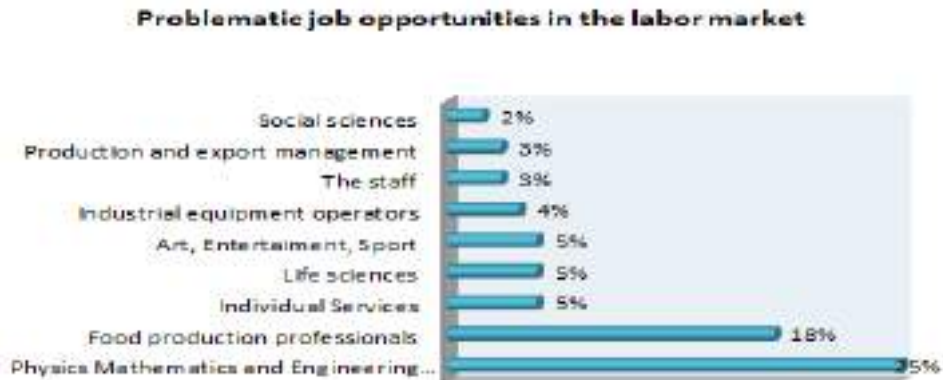

Figure 3. Problematic job opportunities in the labor market

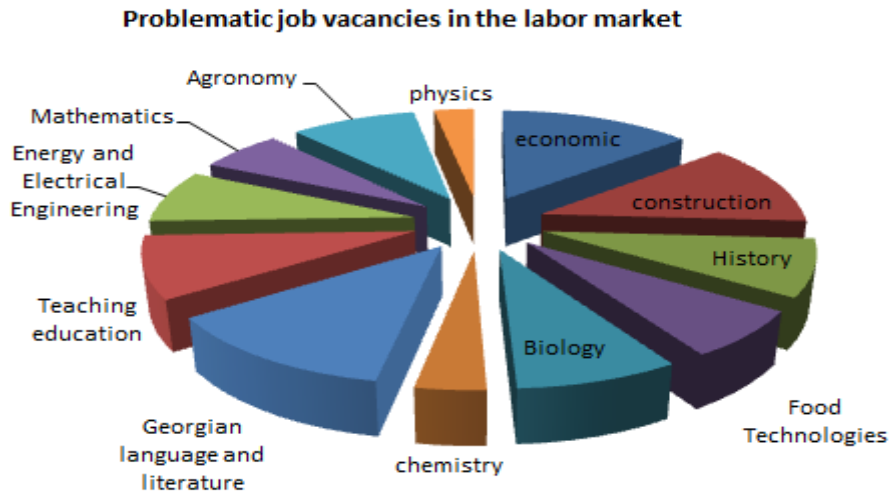

Figure 4. Problematic job vacancies in the labor market

The Figures show that in determining the number of students, labor market trends are not taken into account (Abuselidze, 2019). Specifically, the most problematic areas are occupied by the last places, and at the first place there is economy – with the highest number of places. Also, the number is not proportional to the graduate employment indicator. Within the survey, by using a stratified method, academic performance of third-year students in 6 economics specializations has been studied. As a result, it is estimated that the GPA of about 31% of students is less than 2 (maximum possible GPA is 4). It means that 1/3 of the students are not very interested in studying and the educational program does not expect to be prospective. (The survey of university students reveals that most of the respondents consider the program to be unperspective). The outcome of this study clearly demonstrates our above mentioned hypothesis that students are selecting programs that are funded by the state but not by the desire to master the profession, but by the fact that education is free.

The worst results are the students of the Faculty of Education, the specialty of which is funded by the state. From the four courses of Bachelor's Study, 325 students' GPA were studied. The survey revealed that GPA of 61% of students are lower than average level.

Figure 5

Source: Drafted by the authors based of the data of the University Quality Assurance Service

We Separated the assessment of the freshmen because since the first course will learn basic general subjects such as psychology, philosophy, history, etc. The student's interest in these subjects should be more therefore, their assessment should be higher but the real picture is the opposite.

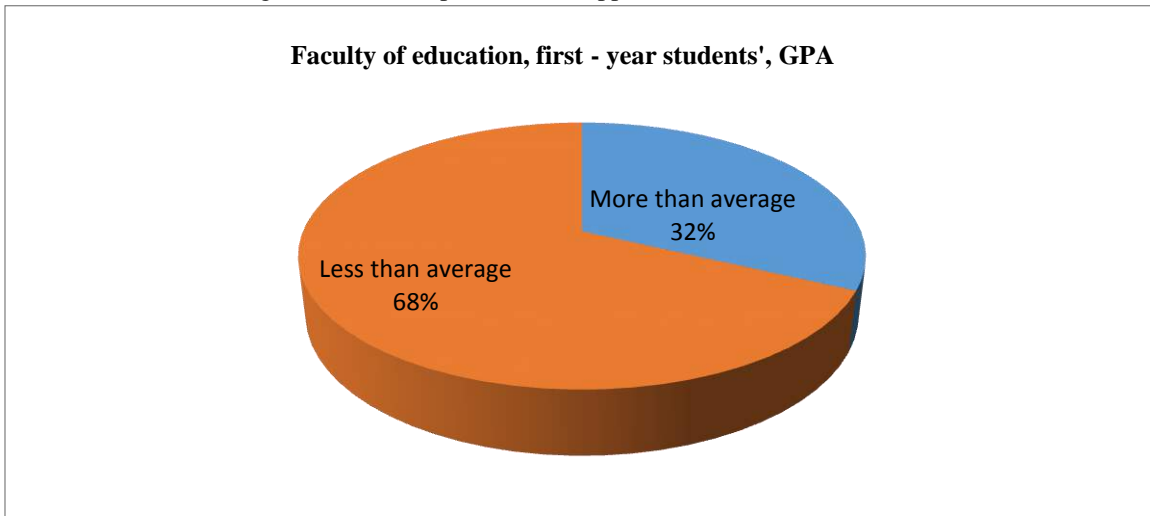

Figure 6

Source: Drafted by the authors based of the data of the University Quality Assurance Service

The results show that the state's funds are spent ineffective. A student who performs an educational program is completely uncompetitive, because he does not possess sufficient knowledge and skills, plus lack of job opportunities, and most graduates are simply unemployed. For the economic and social development of the country it is important to employ graduates with their own profession. Important Goals of financing the priority directions of higher education is to prepare students for professional work and to use existing intellectual capital wisely (Order N81 / n of the Ministry of Education and Science of Georgia, Article 2).

One of the main indicators of the effectiveness of funding of priority programs should be the employment index. Which, in our opinion, confirms the efficient connection of the priority program with the labor market requirements and shows the level of social recoveries. In this regard, according to an analysis of the situation in the 28 countries of the EU in 2017 (Eurostat, 2019), it is estimated that the average employment rate for people

with higher education in the last three years is 82.8%. The highest rate was in Malta - 94.5% and in Germany - 90.9%, while the lowest rate was in Greece - 52% and Italy - 55.2%. Only 41% was in Georgia. In addition, the average employment period of graduates is 6 months, and the most frequent recurring period is one month.

According to the Organization for Economic Cooperation and Development of Europe, the average social indicator in European countries is 15% (Education at a Glance, OECD 2018), while in Georgia the result is only 7.7%. According to Georgia's audit data, compared with the general index of European countries and those countries that are relatively close to Georgia the level of benefit received within the program is low (Georgian audit, 2019).

Based on the above mentioned, a small portion of the graduates are engaged in their profession and budgetary financing for them is ineffective. Determining the priority directions and determining the number of students without taking into consideration trends and data increases the risk of structural unemployment. In addition, it is revealed that, unlike international practice, the Ministry has developed a system based only on a criterion whose calculation is based only on historical experience and does not provide qualitative indicators. This creates a precondition that universities receive fixed funding despite the number of students and their academic performance, that is why the university will receive program financing in a fixed amount, even if the specified places are not filled in full. Therefore, the Ministry of Education has not developed a procedure for determining the number of students eligible for the higher education priority direction. Which means setting up a uniform system in determining limits according to the curriculum and determining the number of students admitted by universities. While the number of student applicants in the Baltic States is determined by qualitative indicators (European Commission, 2019), such as the results of scientific activity in the specific direction, the qualification of the academic personnel, the student mobility and graduates employment indexes, etc. The number of students eligible for a specific educational programs funded by state will be determined based on the analysis of these indicators.

According to Volchik et al (2018) As such, in order to succeed, universities have to recognize these challenges and formulate and implement corrective actions. Therefore, the reason of the flaws in the financing of the priority programs is the funding model, and the fact that there is no analysis of the results achieved within the program and the appropriate reaction does not occur. All above mentioned would allowed the limits to be distributed between universities and the existing financial resources would be used for financing more students or other programs.

3.2. International practice of financing higher education

EU countries are characterized by using facilitation model focused on strengthening institutional freedoms and strengthening accountability mechanism between higher education institutions. There are two models of facilitation (Tertiary Education for the Knowledge Society Volume 1 p.90): 1. Universities have academic freedom but subject to state control; 2. Universities are fully independent, but have the responsibility to contribute to the implementation of the state objectives. At this time, accents are made on what mechanisms should be used to make the HEIs more accountable to contribute to achieving public goals. To achieve this, the monitoring system has been implemented to analyze the interim and final results of functioning HEIs, which implies permanent reporting of their activities to the Ministry, these models are available in Dutch and Anglo systems - Great Britain, the United States, Canada, New Zealand and Australia. The mechanism of higher education financing in EU countries consists of many factors. At the time of funding it is important to improve teaching quality, to increase the rate of successful students, to establish institutional profile and to increase the diversity of educational programs. Each university in the contract indicates how it is going to improve these indicators (European Commission, 2018). Evidently, this system bears all the essential features of a best practices and benchmarking philosophy, which as Zairi (2010) observed, involves identifying key performance

indicators or metrics for assessing performance. In this case particularly, the metrics or the parameters used in the ranking are derived from the core mission of institutions of higher learning, including teaching, research, knowledge transfer, and international outlook (Gunter and Raghuram, 2018; Radwan, 2018).

Based on the aforesaid criteria, the government uses mainly a block funding method, wherein a lump sum allocation is given to the country's public universities based on the number of students enrolled multiplying a student unit cost by the total number of students within a given university (Fussy, 2017). According to Kyvik and Lepori, for most Western universities, allocation of funds to universities sometimes is a negotiation between the state and higher education institutions and allocation is made based on performance measure or calculated through a formula (Kyvik & Lepori, 2010).

In the form of financing, countries are increasingly using qualitative indicators. In particular, Belgium, Czech Republic, Finland, Holland, Portugal, Spain use qualitative indicators. And Sweden and Switzerland focus on the number of credits accumulated by students and the average duration of learning. The Netherlands uses the measurements of used resources (INPUT) and achieved results (OUTPUT). Some countries also provide the labor market requirements for financing. Finland, for example, based on the labor market forecasts, distributes financial resources between universities and curriculum. While in Estonia, the need of specialists with higher education quality on the labor market is taken into account. In Thailand, for example, the government initiated higher education reforms to cut public spending and to stimulate university–industry cooperation as a means to obtain additional university income (Schiller & Liefner, 2006). Similarly, in Europe, universities which were publicly funded by the state and traditionally specializing in both teaching and research are said to be under pressure to review their missions as a coping strategy to financial austerity in all public-sector services (Pierson, 2001). This trend has affected many countries and has been a significant fall even in advanced countries such as the United Kingdom, Australia, and New Zealand. The education financing system at any level of education invariably requires a set of effective mechanisms for generating education revenue and fund allocation formulae, which are actually methods of allocating funds (Galabawa, 2005).

This, in our view, is possible through the program budget methodology, by implementing programs orienting on results. In our opinion, the components of financing formulas should be:

- * Basic funding component - 37%;
- * Component of results (calculated by the number of diplomas) - 50%;
- * Component of students' number - 13%.

4. Conclusions and recommendations

The current model of higher education financing in Georgia is based on one criterion. The number of students and does not provide qualitative parameters. As a result, the state financial resources are distributed among the universities according to the number of students, which induces the inefficient spending of budget resources. Due to improper coordination between state structures, higher education institutions and employers during the process of determining each priority direction, the need of specialists in this field is not assessed properly, also monitoring of the achieved results and efficiency of the program is not implemented. Consequently, there is no need to adjust the funding rules and priority directions needs. For the reduction of structural unemployment risks, it is necessary to define the number of students to be financed. In order to spend budget resources efficiently, it is necessary to develop a model of software financing where qualitative and quantitative indicators will be used.

Cognitive competences of preschool children in relation to their gross motor skills

Zdeněk RECHTIK¹

¹Lecturer, Palacky University in Olomouc, Faculty of Education, Department of Primary and Pre-primary education
Email: zdenek.rechlik@upol.cz

Abstract

Children need a wide range of skills to transition successfully to formal schooling. Promoting children's readiness for school is an important societal and it should be also governmental priority. There are known strategies such as grants or projects aimed on this problematics in the world, but not in the Czech Republic. However, the evolvement of motor skills (independent locomotion) enables the child to explore the environment, that leads to new and differentiated cognitive concepts, this problematics is still not in the center of interest in the Czech professional society. Researchers worldwide have not explained adequately how motor skills are connected with cognitive competences. Therefore, the aim of the project is to assess the relationship between the level of gross motor skills of pre-primary aged children and their cognitive competences. The research group consisted of 100 children from Czech kindergartens at the age $5,74 \pm 0,71$ years. For the assessment of gross motor skills was used standardized TGMD-2 test battery. The cognitive competences of a child were assessed by the standardized test, which is mapping child's readiness for school attendance (MaTeRS). The Ethics Committee approval of the author's department was obtained for the research. The participation of the child in the research was voluntary, anonymous, free of charge and with the possibility to withdraw from the research anytime. The data was obtained within the project IGA_PdF_2019_015. The findings could have implications for government and teachers to focus more on development of cognitive and motor skills in preschool children.

Keywords: cognitive ability, motor skills, children, preschool

Introduction

The link between motor and cognitive performance is supported by several studies indicating that cognitive and motor skills share overlapping neural mechanisms and draw on common resources (Michel, Roethlisberger, Neuenschwander & Roebbers, 2011; Piek, Dyck, Francis & Conwell, 2007). Stöckel & Hughes also suggest that cognitive and motor skills are linked. Studies that directly tested the relation between global aspects of motor skill and cognitive performance have reported only weak associations between these two processes (Roebbers & Kauer, 2009; Wassenberg et al., 2005). The problematics of motor skills and their improvement in connection with different areas of pre-school children competences and behavior is recently in the interest for many researches (Lestari, Ratnaningsih, 2016; DuBose, McMillan, Wood, Sisson, 2018; Famelia, R., Tsuda, E., Bakhtiar, S., Goodway, 2018; Obrusnikova, Cavalier, 2018; Mancini, Rigoli, Roberts, Heritage, Piek, 2018). Research in this or similar area is in the Czech Republic rather neglected. Although many researchers suggest the importance of fundamental motor skills (Lubans, Morgan, Cliff, Barnett, Okely, 2010; Haga, 2008; Lopes, Santos, Pereira, Lopes, 2013), there are no complex studies and this area is still evolving. MacDonald, Lipscomb, McClelland, Duncan, Becker, Anderson, Kile (2016) mention that object control skills, which are part of gross motor skills, have modest to moderate relations with executive function and social behaviors in preschool year. These factors, therefore, can influence school readiness and beginning of compulsory school attendance. The importance of fundamental or basic motor skills for adaptation on school environment demonstrate also Suggate, Pufke, Stoeger (2016) in their study. Van der Fels, Wierikea, Hartmana, Elferink-Gemsera, Smitha, Visscher (2015) deal with systematic review about motor skills and cognitive skills but in a huge age category (4 - 16 years). The authors confirmed that there was either no correlation in the literature, or insufficient evidence for or against many correlations between motor skills and cognitive skills. Therefore, the

aim of our research is to find out the relationship between motor skills and cognitive competences in preschool children. The following questions were solved within the research:

1. Is there a relationship between gross motor skills and cognitive skills in pre-school children?
2. Is there a difference in the level of gross motor skills in terms of gender?
3. Is there a difference in the level cognitive competences in terms of gender?

Method

A research group consisted of 100 children (50 boys, 50 girls) at the age of 5.26 ± 0.45 years from kindergartens as part of compulsory pre-school attendance. Compulsory pre-school education in the Czech Republic applies to children who reach the age of six in the following school year and are this type of education leads to compulsory primary school education. Primary school education starts the child after reaching the age of six. For the participation in the research group was chosen intentional selection, where the criterion for inclusion was the level of gross motor skills of pre-school child in the category above-average to superior. The research was approved by the Ethics Committee of the Pedagogical Faculty of Palacký University in Olomouc and implemented as part of the IGA_PdF_2019_015 project. The child was placed in the research after signing written agreement of his / her parents / legal representatives and after the approval of the management of kindergartens. The participation in the project was voluntary and free of charge. The anonymity of the data was declared and guaranteed to all participants. Testing was done within inner spaces of kindergartens, in accordance with manuals for work with selected methods and techniques of research work. Children may have asked questions during the testing, could at any time temporarily interrupt or leave the research based on their decision or decision made by their parents/ legal representatives. Children's responses were observed and, in case of a negative reaction, testing was interrupted or ended. The level of motor skills was determined by the TGMD-2 test (Ulrich, 2000), which monitors the level of locomotor and object control skills. The result is a standard score that is converted from rough score based on the child's age and gender. The standard score is converted to Gross Motor Quotient (GMQ), which is an indicator of the final level of gross motor skills. Based on GMQ, the level of motor skills is assessed in the following categories: very superior (>130 points), superior (121–130 points), above average (111–120 points), average (90–110 points), below average (80–89 points), poor (70–79 points) and very poor (<70 points). For the evaluation of cognitive skills the test MaTeRs (Vlčková & Poláková, 2013) was used. MaTeRS serves for the evaluation of so-called school readiness of a pre-school child in the area of fine motor skills. Part of the test can be administered in groups (max. 8 children), the second part, which follows immediately, requires individual examination. The result in each subtest is a rough score, which is calculated based on the child's age as a weighted score. The sum of the weighted scores is converted into an overall cognitive assessment (categories 0-5), where 0-2 means not ready for compulsory schooling, category 3 represents the minimum school readiness, category 4 stands for school readiness with slight exceptions and 5 means the child's readiness to attend school without exceptions. The relationship between cognitive competences and the child's gross motor skills was correlated. Gender differences in gross motor and cognitive competences were evaluated by t-test. The level of significant importance was declared on $p < 0.05$. Data were processed by software STATISTICA, version 13.4.0 (Tibco Software, Inc., 2019).

Findings

As it was said above, only children with higher level of gross motor skills than average were chosen for the research. Detailed categorization according to gross motor skills can be seen in Table 1. From the results is clear, that girls achieved better results in gross motor skills. Also statistical processing confirmed statistically significant differences $p=0,002$ by using t-test. Mean value for boys was 129,70 and for girls 133,82 points of GMQ (Table 2).

Table 1. Number of children according to their GMQ level (n=100)

Very superior	Superior	Above average
---------------	----------	---------------

All	49	50	1
Boys	19	30	1
Girls	30	21	0

With closer look on two subtest of motor skills – locomotor skills and object control skills, we can say, that there was no statistically significant difference in locomotor skills in term of gender ($p=0,50$), mean values for boys and girls are shown below in Table 2. Also in the second subtest was not found significant difference between boys and girls in object control skills ($p=0,31$) according to rough scores. Based on the overall result where is significant difference between boys and girls, it is clear, that there is very important fact, that in object control skills girls have different standard scores than boys, which for sure made the significant difference, although rough scores were almost similar. We confirmed this fact also with statistical processing of standard scores and we get significant difference $p=0,00$, where mean value for boys was 13,82 standard score and girls achieved 15,76 standard score.

Table 2. Average levels of gross motor skills in detail (n=100)

	GMQ [points]	STDd.	OCS[score]	STDd.	LOK[score]	STDd.
All	131,78	6,80	43,82	2,91	45,33	1,65
Boys	129,70	6,01	44,12	2,78	45,44	1,65
Girls	133,82	6,90	43,53	3,01	45,22	1,64

Legende: GMQ – Gross Motor Quotient; STDd. – Standard Deviation; OCS – Object Control Score; LOK – Locomotor score

From the point of view of cognitive skills, more than half of pre-school children from our research group are according to used methodic (MaTeRS) is ready for school with no exceptions (Table 3). Only 13 % of children are border ready and 35% are also ready for compulsory school attendance but with some exceptions. So it can be said, that results from cognitive assessment are rather positive. Using statistical processing there was not found significant difference between boys and girl in terms of cognitive skills according to rough scores $p=0,10$. Boys achieved higher mean rough score 38,92, while girls only 37,02.

Table 3. Hodnocení kognitivních schopností dle připravenosti na školu (n=100)

	Boys	Girls
0 -2 not prepared	0	0
3 - border ready	2	11
4 - ready with exceptions	20	15
5 - ready for school	28	24

Between gross motor skills and cognitive competences was found negative correlation $r=-0,25$ ($p\leq 0,05$). In the cognitive competence subtest called general knowledge was not found significant difference between gender ($p=0,12$), but boys had better knowledge (mean for boys is 24,14; girls=22,49). Second subtest from the area of mathematics revealed no significant difference between genders ($p=0,06$) and boys also performed better (mean for boys=8,84; girls=8,12). Statistical processing revealed significant differences between genders ($p=0,00$) in subtest aimed on geometrical shapes, where boys performed better (boys=4,62; girls=3,98). No significant difference between genders was found in graphomotorics subtest ($p=0,24$), but in this case girls achieved better results (boys=11,74; girls=12,35). Another subtest connected to drawing of a figure also did not found significant difference between genders ($p=0,82$), girls also performed better but only little (boys=4,22; girls=4,25). Another subtest aimed on hearing perception revealed significant difference between genders

($p=0,00$). Here performed boys better (mean for boys=26,50; girls= 23,67). Visual perception did not showed significant differences in terms of gender ($p=0,79$). The last subtest from cognitive part of the test aimed on spatial perception also did not showed significant difference ($p=0,11$), but boys again performed better (mean for boys=8,64; girls=7,86).

Results, Conclusions and Recommendations

The main question that was solved within the research was if there is a relationship between gross motor skills and cognitive competences in pre-school children. Statistical processing revealed weak negative correlation $r=-0,25$, that means if cognitive competence are higher, levels of gross motor skills tends to be lower. But when we look closer on the results, interesting things can be seen. Although we found negative correlation between the level of gross motor skills and cognitive competences, we found that girls have significantly higher level of gross motor skills ($p=0,002$) and also performed significantly better in object control skills ($p=0,00$) than boys. And interesting thing is that although girls did not have significantly better results, they performed better in graphomotorics and drawing a figure than boys, which is connected to fine motor skills and object control skills. So these results suggest possible relationship between those categories. This corresponds to studies that say that fine motor skills, especially those that require integration of visual and motor systems, are emerging as an important factor for children's development of executive function, self-regulation, and later success in school (Becker, Miao, Duncan, & McClelland, 2014; Carlson, Rowe, & Curby, 2013). This problem should be further researched probably on higher number of probands and possibly using different research tools to confirm relationship also with cognitive competences. Another limitation could be the intentional selection of gifted and skillful children – based on their level of gross motor skills. The second research question was confirmed and also commented above. Third research question was also answered. There was not found significant difference between boys and girls in cognitive competences. But each subtests were also examined and assessed and revealed some significant differences. Boys are significantly better in area of geometrical shapes, which focuses on the knowledge of the form and naming of the geometric shape, where the children should be able to perceive relational terms like above, under, next to, between etc. The child also should be able to name and distinguish directions like right, left, up and down. Another significant difference in terms of gender in favor for boys was found in hearing perception ($p=0,00$). Hearing perception is an important tool for communication and highly influence development of speech and thinking. Hearing perception is also a foundation for reading and writing and is considered to be linked to current level of speech abilities of the child. In other parts of the MaTeRS test were not found statistically significant differences. But further research should be also done and could search for possible relationship between mentioned subtests. Also MacDonald Lipscomb, McClelland et al. (2016) confirmed that children's visual-motor integration and object manipulation skills in the fall have modest to moderate relations with executive function and social behaviors later in the preschool year. These findings have implications for early learning initiatives and school readiness.

Relationship between Motor Skills and Academic Performance in Preschool Children

Ludmila MIKLÁNKOVÁ¹

¹*Assoc. Prof. Dr., Department of primary and pre-primary education, Faculty of Education Palacký University in Olomouc, Czech Republic, E-mail: Ludmila.miklankova@upol.cz*

Abstract

Current educational strategies prefer a close link between movement and academic skills. Education in the youngest age categories of human life enhances the effects of the educational process in older age categories. Retention increases and stability of acquired skills becomes permanent. Current research deals with the relationship between motor skills, physical activity or fitness and the academic skills of children. The aim of this research is to determine the relationship between Motor Skills and Academic Performance in pre-school children. In this period, in some cases, it is still possible to eliminate some problems in the area of motor skills by appropriately selected educational methods and procedures. The level of motor skills was determined by TGMD-2 test. To determine the level of academic skills, a subtest for the evaluation of graphomotorics and visual-motor abilities called MaTeRs was used, which is used to assess the school readiness of a pre-school child in the area of fine motor skills. In the research participated 100 children aged 5.26 ± 0.45 years. The relationship between graphomotorics and child's motor skills was correlated. Data was obtained within the project IGA_PdF_2019_015. Exploring the importance of preschool child motor skills for its future success in the educational process is still in its beginnings. Therefore, it is necessary to consider this issue in a given age category to a much greater extent and to examine it from various points of view.

Keywords: preschool age, graphomotor skills, vizuo-motor skills, cognitive premise, motorics

Introduction

Education in the youngest age categories of human life enhances the effects of the educational process in older age categories. Retention increases and stability of acquired skills becomes permanent. Physical activity is associated with the support of the child's health and is an integral part of his physiological motor development. It influences the quality of emotional, social and cognitive development (Bart, Hajami, Bar-Haim, 2007; Mavilidi, Okely, Chandler, Paas, 2017; Carson, Hunter, Kuzik et al., 2016). The family, as the basic social group in, which the child is born and initially lives, considers the foundations of the relationship to physical activities, both positive and negative. The family's lifestyle is a model for the child, which he/her often imitates during his/her adulthood. The share of the state in the education and training of a healthy generation consists in creating suitable conditions for the realization of physical activities and in targeted interventions in the movement regime of children during their stay in school. Current educational strategies prefer a close link between movement and academic skills. Latest researches deal with the relationship between motor skills, physical activity or fitness and the academic skills of children. Some researches already mention the influence of physical activity on memory and concentration, which are directly related to school success and academic achievement (Tremblay, Inman & Willms, 2000; Trudeau & Shepard, 2008; van der Niet, Hartman, Smith & Visscher, 2014). According to Donnelly et al. (2016) and Paas & Sweller (2012) physical activity has a positive impact on the development of thinking and brain function and this topic should be further examined. Oberer, Gashaj, & Roebbers (2017) confirmed in their research the relationship between gross and fine child motor skills and the level of their executive functions. The low level of gross motor skills correlates with low adaptability and social competences and thus contributes negatively to the child's level of school success (Oliver, Schofield, Colt, 2007; Smith et al., 2013). Acquired motor skills enable the child to gain information and influence the environment, get to know and make contact with other children (von Hofsten, 2004; Leonard, 2016; Wang, 2018). In preschool age, a child examines and evaluates the environment through their physical activity, and on the other hand, the opportunity to explore and evaluate activities, objects and persons around the child develops his / her thinking, observation and reasoning. Deficits in fine motor skills are an indicator of learning disabilities (Grissmer, Grimm, Aiyer, Murrah

& Steele, 2010; Yang, Cheong & Hong, 2006; Venetsanou, Kambas, Aggeloussis, Serbezis & Taxildaris, 2007; Gwynne K, Blick, 2004). As part of compulsory education, the child performs tasks that include both cognitive and motoric components, so it is logical to conclude that there is a close link between these components and school success. The low level of motor skills also correlates with low social adaptability and social competences and thus contributes negatively to a child's compulsory school failure (Oliver, Schofield, Kolt, 2007; Smith et al., 2013; Fedewa, Ahn, 2011; Diamond, 2015; Schmidt, Benzing, Kamer, 2016). Support of physical activities and aimed development of the child's motor skills in pre-school education could thus positively influence its future academic skills, physical fitness and prosocial behavior. The aim of the research is to find out the relationship between motor skills and selected academic performance in preschool children. The following areas were assessed in the research:

1. the relationship between gross motor skills and graphomotor skills in pre-school children,
2. the relationship between gross motor skills and visual motor skills in preschool children,
3. the existence of gender differences in the level of motor skills, graphomotorics and visual motor skills.

Method

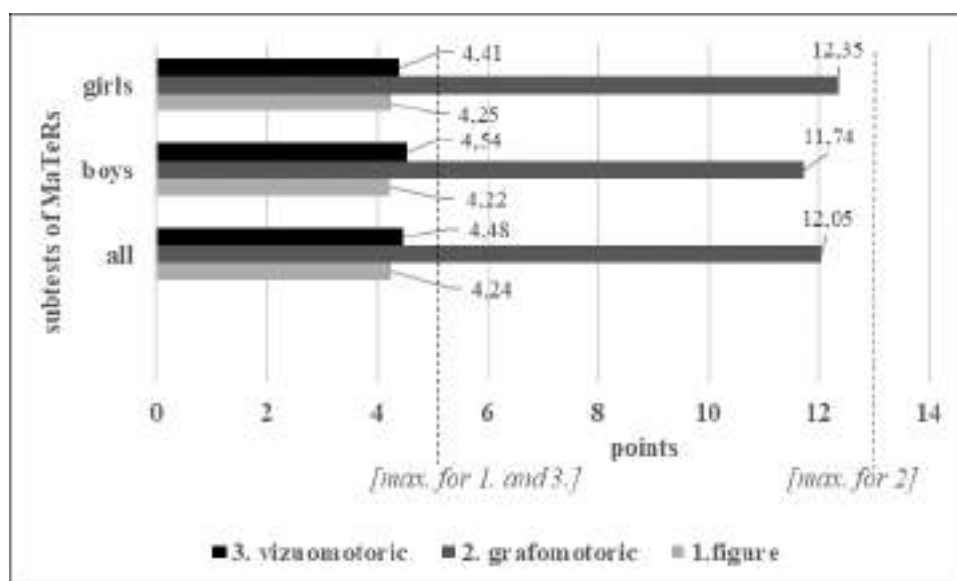

from kindergartens as part of compulsory pre-school attendance. Compulsory pre-school education in the Czech Republic applies to children who reach the age of six in the following school year and are this type of education leads to compulsory primary school education. Primary school education starts the child after reaching the age of six. For the participation in the research group was chosen intentional selection, where the criterion for inclusion was the level of pre-school child in the category above-average to superior. The research was approved by the Ethics Committee of the Pedagogical Faculty of Palacký University in Olomouc and implemented as part of the IGA_PdF_2019_015 project. The child was placed in the research after signing written agreement of his / her parents / legal representatives and after the approval of the management of kindergartens. The participation in the project was voluntary and free of charge. The anonymity of the data was declared and guaranteed to all participants. Testing was done within inner spaces of kindergartens, in accordance with manuals for work with selected methods and techniques of research work. Children may have asked questions during the testing, could at any time temporarily interrupt or leave the research based on their decision or decision made by their parents/ legal representatives. Children's responses were observed and, in case of a negative reaction, testing was interrupted or ended. The level of motor skills was determined by the TGMD-2 test (Ulrich, 2000), which monitors the level of locomotor and object control skills. The result is a standard score that is converted from rough score based on the child's age and gender. The standard score is converted to Gross Motor Development Quotient, which is an indicator of the final level of gross motor skills. Subtests for the evaluation of graphomotoric and visual-motor skills of MaTeRS (Vlčková & Poláková, 2013) was used to determine the level of academic abilities that are an indicator of the child's school readiness before starting compulsory school attendance. MaTeRS serves for the evaluation of so-called school readiness of a pre-school child in the area of fine motor skills. Part of the test can be administered in groups (max. 8 children), the second part, which follows immediately, requires individual examination. The result in each subtest is a rough score, which is calculated based on the child's age as a weighted score. The sum of the weighted scores is converted into an overall cognitive assessment (categories 0-5), where 0-2 means not ready for compulsory schooling, category 3 represents the minimum school readiness, category 4 stands for school readiness with slight exceptions and 5 means the child's readiness to attend school without exceptions. However, for a clinical examination by a school psychologist, the level of percentiles and weighted scores is being used and the same is being done in this research. The relationship between the weighted scores of graphomotoric and visual-motor skills and the child's gross motor skills was correlated. Gender differences in gross motor and cognitive competences were evaluated by t-test.

Findings

Researched children achieved from above-average to superior levels of motor skills. The average score in the motor skills test was 131.78 ± 6.80 (boys 129.70 ± 6.01 ; girls 133.82 ± 6.90). In locomotor skills (45.33 ± 1.65) both boys (45.44 ± 1.65) and girls (45.22 ± 1.64) were in the 95-98 percentile of the population. Object control skills (43.82 ± 2.91) showed lower levels than in locomotor skills, but no statistically significant differences were found between girls (43.53 ± 3.01) and boys (44.12 ± 2.78). From the point of view of object control skills, the research group ranks among the 74–84 percentile population. The group of boys in object control skills ranged from 84–91 per centile, while girls from the 95–98 per cent of the population. In terms of overall score in the motor skills test, a statistically significant difference ($p \leq 0.01$) was found in favor of girls. Hardy, Farrell, Macniven and Howlett, (2010) in their research on preschool children report significant gender differences in some sub-components of motor skills, but do not confirm them in the overall score of the research group. Dadkhah (2004) did not find significant differences between girls and boys in pre-school age in most of the coordination skills studied. Problems were observed in children in subtest jumps on one leg, which can be difficult for preschool children in terms of coordination and the dynamic strength of the lower limbs. In this subtest, girls achieved worse results than boys. The most difficult from the object control skills category was the subtest dribbling, for both boys and girls, which again belongs to the coordination difficult disciplines. Another very challenging skill for kids was hitting the static ball. But this skill is not generally preferred in the population because games based on it (baseball, softball, etc.) are not traditional in the Czech Republic. Some authors point out that tactile experiences through manipulation of various objects can positively affect cognitive processes (Boncoddo, Dixon, Kelley, 2010; Lindgren, Johnson-Glenberg, 2013). The test used has similar characteristics to, for example, The Rey-Osterrieth complex figure (Watanabe et al., 2005) or the Stanford-Binet Intelligence Scale (2003, 5th edition) (Roid, 2005). The first subtest on which graphomotoric skills of a pre-school child are evaluated in the Czech Republic is Figure Drawing Test. According to Vágnerová (2018), the drawing of a human figure reflects the child's psychological development and the ability to display it. An important role is played by the level of fine motor skills and hand-coordination, which are the signals of the so-called school maturity of the child. Changes in the representation of the visible object are always reflected in a certain period and are one of the signals of the achieved development level. The object / human figure is an indicator of visual perception, imagination, memory, fine motor skills and sensomotrics, but also the level of achieved intellectual abilities. Of the total maximum score (5 points), the research group scores 4.24 ± 0.75 (boys 4.22 ± 0.76 , girls 4.25 ± 0.74), which corresponds to the 84 percentile achieved by the general population. In this subtest, no differences were found in terms of gender ($p \leq 0.81$). In another subtest, called "graphomotorics," in the form of a game, children illustrate the curves (wavy lines, arcs, vertical short lines) of the presented figures. The grip and level of pencil control are evaluated. From the maximum score (15 points), the children achieved 12.05 ± 2.61 points from the research sample, which is considered the 87 percentile of the general population. Girls achieved a better score (12.35 ± 2.71 points) than boys (11.74 ± 2.46 points), but this result was expected due to the traditional difference in preference for activities in the area of fine motor skills in girls by parents. In this subtest, no differences were found in terms of gender ($p \leq 0.24$). In the visual-motor aspect, the ability to distinguish the deployment of objects and to reproduce this deployment as accurately as possible is evaluated within school readiness. From a maximum score of 5 points, the children in the research group achieved 4.48 ± 0.74 points, a score of 36 percentiles of the general population. This result can be described as below average. There were no statistically significant differences between boys (4.54 ± 0.73) and girls (4.41 ± 0.75) ($p \leq 0.39$) (Fig. 1).

Figure 1. Score of persons in MaTeRs test (n= 101; nboys=50, ngirl=51)

Similar to Brossard-Racine et al. (2011), Parush et al. (2010), Daly, Kelley, and Krauss (2003) or Volman et al. (2006) we confirm the correlation between the results in figure drawing test and pencil grip ($r = 0.63$) ($p \leq 0.05$) as well as between the level of the visual motor and the pencil grip ($r = 0.59$) ($p \leq 0.05$). There was no correlation between the overall level of motor skills and individual subtests to monitor compulsory school attendance for the given research group. The correlation coefficient values do not show a low dependence either. A negative correlation value was found for the visual-motor evaluation subtest. However, with the development of neurological sciences, the issue is increasingly being investigated. A number of researches confirm the relationship between motor skills and cognitive functions, which are an important prerequisite for a child's compulsory school success (Coe, Pivarnik, Womack, Reeves, Malina, 2006; America SoHaPE, 2014; Telford, Cunningham, Fitzgerald, 2012). On the contrary, Keeley and Fox (2009) do not find enough evidence to link the level of physical activity, motor skills, and academic prerequisites. But they note that a weak positive link has been found between physical activity and fitness, as well as between academic achievement and fitness and elements of cognitive function. They see weaknesses in a very low number of intervention studies.

Results, Conclusions and Recommendations

Exploring the importance of preschool child motor skills as a predictor of success in primary school education is still at the beginning. Partial researches done in recent years point to possible relationships between motor development, cognitive abilities and social skills in both intact and disabled children. Teachers/ educators should be aware and informed of this and focus on monitoring children's motor skills. Early detection of problems in these areas and subsequent aimed interventions can be positive for the youngest age groups. In pre-school education in kindergartens, some problems in the area of motor skills could be eliminated by appropriately selected educational methods and procedures within the application of intervention programs. That is why it is necessary to focus more attention to this issue in a given age category and examine it from various perspectives.

Abstract

Some concepts such as lifelong learning along with the beginning of the twenty-first century began to become more popular all over the world. Undoubtedly, the development of technology at a dizzying pace and the fact that access to information is made easier than ever, has an important role in making lifelong learning so popular. While accessing a lot of information required a time-consuming process, it has become possible to reach information within seconds by means of the facilities offered by the Internet. In today's societies, thanks to the opportunities offered by the internet, people of all ages and social status are more likely to have more and more information than the past, but the possibility of having false or incomplete information due to the information provided by the Internet has increased as well. In 2008, the term – agnotology - was coined to describe the study of ignorance and its cultural production. Agnotology tries to answer how and why we do not have knowledge about things. On the other hand, lifelong learning includes the answers to the question of how to reach the right information through lifelong ways. This study aims to help lifelong learners how to diagnose and cope with agnotological productions in cyber environments. For this purpose, various scientific studies on this subject have been examined. The results and recommendations of the study obtained in the light of the data examined are not included as the data analysis process continues.

Keywords: lifelong learning, agnotology, cyber world.

Mobility of Elderly People in Super-aging Society: A Survey in Japan

Ryosuke ANDO¹

Abstract

In order to understand mobility of elderly people in Japanese super-aging society, a survey was conducted by targeting three super-aging districts in Toyota City where the aging rates are higher than 30%. Totally, 889 samples were obtained from all 2,292 households with elderly people. As the people mainly drive cars as their travel tools, analysis is also focused on the driving in the future. In terms of comparison among districts, some differences are understood. Most differences reasoned in different locations of hospitals and shopping facilities. Except effects of the facilities locating, all elderly people behave and think very similarly. These kinds of results can make people have a common understanding for the mobility of elderly people in a super-aging society and further call the attentions to make a future plan so as to approaching to a sustainable mobility society.

Keywords: elderly people, sustainable mobility, super-aging society, Toyota City

Introduction

Japan is known as a super-aging society in the world. In Japan, Toyota City is considered as the epitome of Japan because similarities of land-use and population et al. between Toyota City and the whole country. In order to understand mobility of elderly people in this super-aging society, a survey was conducted by targeting three super-aging districts in Toyota City: Ishino, Obara and Asahi, where the aging rates expressed by percentages of elderly people are 30%, 33% and 41% respectively. By the way, elderly is defined as being 65 years old and over. Totally, 889 samples were obtained from all 2,292 households with the elderly people. Contents of the survey include daily life activities, travel modes and so on. As the people mainly drive cars as their travel tools, analysis is also focused on the driving in the future. In terms of comparison among three districts, some differences are understood. Most differences are reasoning different locations of hospitals and shopping facilities. Except effects of the facilities locating, all elderly people of three districts behave and think very similarly. For example, they rarely make use public transport system and tend to driving cars five more years. These kinds of results can make people have a common understanding for the mobility of elderly people in a super-aging society and further call the attentions to make a future plan so as to approaching to a sustainable mobility society. In this paper, the detail results of the surveys and some additional discussions are summarized to let all understand what may happen and what should do from now.

Outline of the Survey

A. Target Area

Three districts are taken as target area for the survey: Asahi, Obara and Ishino in Toyota City. As given in Table I, the aging rates of all these three districts are equal or larger than 30%. Furthermore, these three districts have the following characteristics.

- 1) Asahi: with a high aging rate and most households have only married elderly members.
- 2) Obara: the aging is definitely recognized and many settlements are forecasted to be “marginal settlements”, which is defined as the settlement where the aging rate is higher than 75% and number of the households is less than 20.

3) Ishino: nearby city center area, people seem not worry about elderly mobility in the future.

Table 1. Population and Aging Rates in the Target Area

	Asahi	Obara	Ishino
Population (A)	3,035	4,018	4,498
Elderly people number (B)	1,245	1,346	1,345
Male persons	1,470	1,979	2,194
Male elderly persons	545	570	624
Female persons	1,565	2,039	2,304
Female elderly persons	700	776	721

B. Implementation

The survey is conducted in November 2014. Distributed questionnaire sheets are respectively 430, 442 and 400 in Asahi, Obara and Ishino districts. And collected answers are respectively 300, 297 and 292. Totally, 889 elderly people responded our survey. The gender is shown in Figure 1. About 60% are male and 40% are female. Comparing to the numbers in Table I, we can know that male elderly people have made more active response than female elderly people.

Figure 1. Gender of elderly people

The age distribution is given by Figure 2. Except that Ishino shows more 70-74 years old people, there are not clear differences among three districts.

Figure 2. Age distribution

Results of the Survey

1. Present Mobility

Figure 3 tells us that more elderly people in Ishino are living with their child/children than the elderly people in Asahi and Obara. This may causes that a few more elderly people do not go shopping (Figure 4) because their child/children can go shopping for the family.

Figure 3. Family member

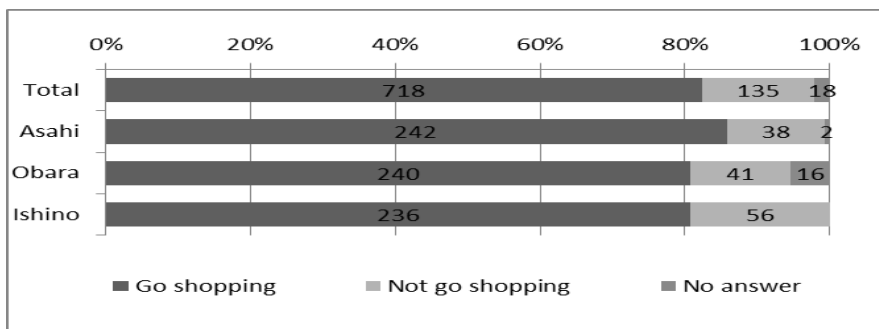

Figure 4. Mobility for shopping

Figure 5 shows that only a small percentage go shopping every day. Most of elderly people go shopping several days a week. And about 80% in all three districts drive cars when shopping. (Figure 6)

Figure 5. Frequency of shopping

Figure 6. Travel modes when shopping

Although there are a few differences between Obara and the other two districts, about 70% are seeing a doctor regularly as seen in Figure 7. Comparing to the travel modes when shopping in Figure 6, the percentages driving cars are a few less but still high around 70% as shown in Figure 8.

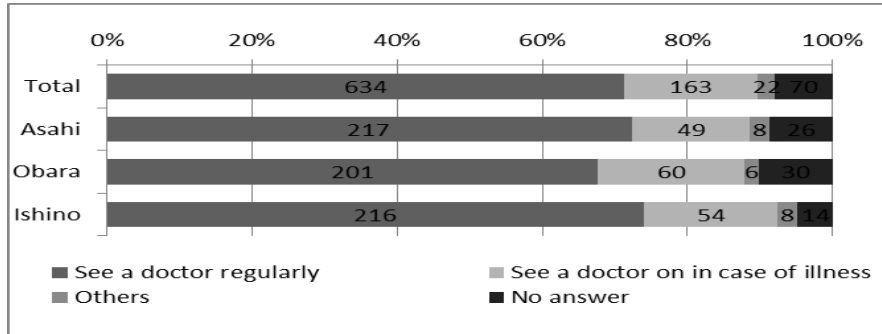

Figure 7. Mobility to see a doctor

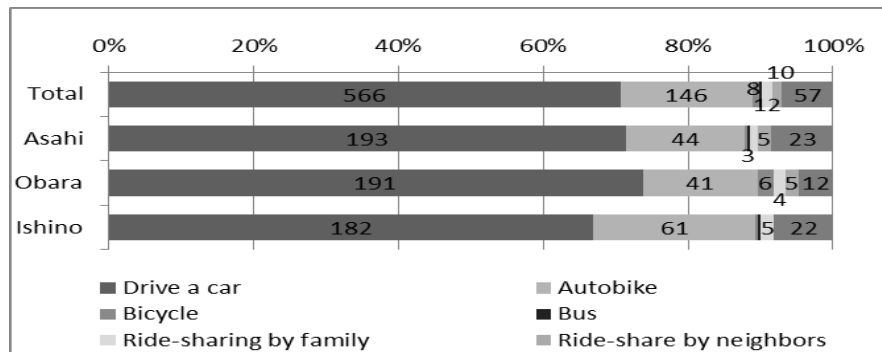

Figure 8. Travel modes when seeing a doctor

2. *Driving Cars Themselves*

Regarding the driver number in the three districts in Figure 9, there is no statistically significant difference.

Figure 9. Number of drivers in the target districts (χ^2 Test: $p=0.263$)

When comparing the drive areas by age group shown in Figure 10, generally, older people limit nearby places only. However, the first obvious change occurs while being 70 years old and the second occurs while being 90 years old. Among the four age groups between 70 and 90 years old, there seems to be no clear difference.

The answers to our question that “until how old do you think being able to drive a car?” are summarized in Table 2. Most elderly people thought they are able to drive between 80 and 85 years old. However, they thought they are able to drive about five more years when they became 80 years old or older.

Being proportional to what understood from Table 2, Figure 11 tells us less than 50% are going to give up driving cars although the percentages get higher as the age is getting older.

Figure 10. Driving area of each age group (χ^2 Test: $p=0.0459^*$)

Table 2. Ages thought being able to drive a car

Present age	Average age answered	Standard deviation
65~69 (n=163)	80 years old	4.89
70~74 (n=157)	81 years old	3.47
75~79 (n=127)	84 years old	5.06
80~84 (n=96)	86 years old	3.80
85~89 (n=44)	90 years old	3.25
90 and older (n=4)	94 years old	1.30

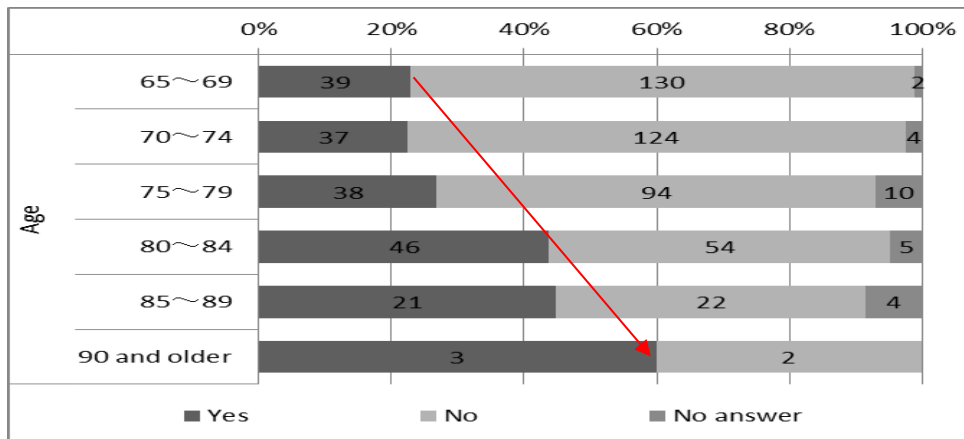

Figure 11. Having thought to give up driving?

3. Possibility to Make Use of Ride-Sharing

As we wanted to consider possibilities of ride-sharing as a counter measures, their experience were asked. The answers are shown in Figure 12. Near 50% experienced when shopping and this percentage became about half when seeing doctors. By the way, here the experienced ride-sharing is not commercial service but just support of family member or a mutual aid of neighbors.

Figure 12. Ride-sharing experience for shopping and seeing doctors

Regarding expected transportation mode if giving up driving, the first choice is bus as summarized in Figure 13. However, the second answer is “don’t know”. This implies that society has not provided enough alternative travel modes for the elderly people.

Figure 13. Expected transportation mode if giving up driving

On bus service, there are statistically significant differences among four evaluation items as shown in Figure 14. The experienced elderly people thought that the safety is the most important and operation time is comparatively less important. On the other hand, the non-experience elderly people thought that cost is less important as given by Figure 15. The same thing is that safety is the most important, too.

Figure 14. Evaluation on public transportation of the experienced people
 (χ^2 Test: p= 0.000**)

Figure 15. Evaluation on public transportation of the non-experienced people
 (χ^2 Test: $p=0.000^{**}$)

However, when we asked the weights directly, the results changed as shown in Figure 16 although the safety is still the most one for both experience and non-experienced elderly people. The lowest weight given by the experienced elderly is clearly the cost and that by the non-experienced elderly is the place. In addition, the weights given by the non-experienced elderly are very nearly equal among four factors. It means the non-experienced elderly are hard to make clear judgment. This also tells us that it is necessary to experience bus service first is really important.

Figure 16. Weights of four evaluation points

Regarding hesitation for going out with neighbors, about 30% answered they did despite of responding to see a doctor, shopping or to allow neighbors riding on their private cars as given in Figure 17 although about 50% said “no hesitation”. Furthermore, it should be noted here about 20% didn’t give their answers.

Figure 17. Hesitation for going out with neighbors

On the other hand, as shown in Figure 18, for both the first stage elderly people (65 through 74 years old) and the second stage elderly people (75 years old and older), the ride-share experience can reduce hesitation.

Moreover, as for the elderly people who have no ride-share experience, the percentage of elderly people feeling hesitation may get less along with being older.

Figure 18. Hesitation for ride-share
 (χ^2 Test: $p < 0.001^{**}$)

Finally, regarding ride-sharing service by elderly people, as shown in Figure 19, in the Ishino district, more than 50% have answered “don’t know” and more than 10% have no answer. These results may be because ride-sharing service is not legal in Japan, so the elderly people cannot imagine that. However, of the remained people, many elderly people responded actively to “be a driver”, “join for operation management”, “support for operation cost” and “supply parking place”. That is, if elderly drivers can drive cars safely and ride-sharing service is allowed legally someday, this business model should be studied again.

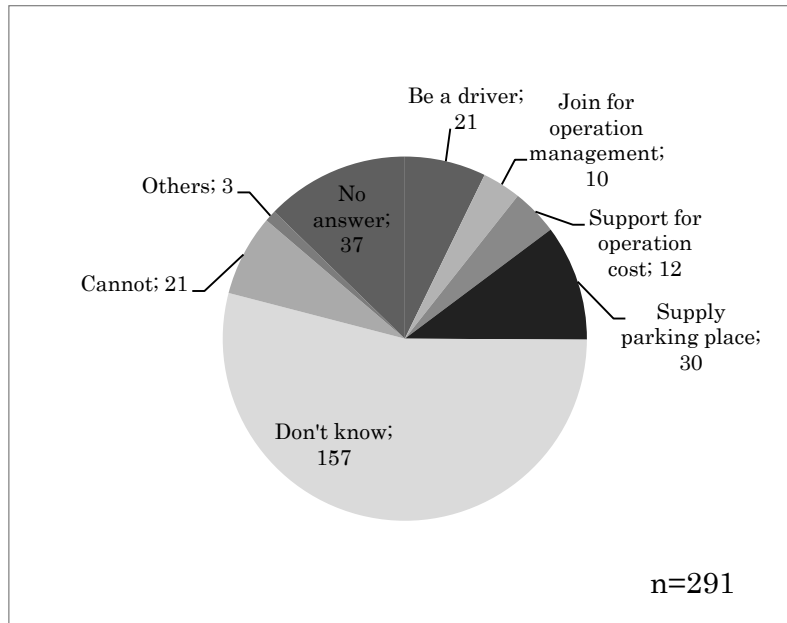

Figure 19. Considering on ride-sharing service by elderly in the Ishino district

Discussion and Conclusion

To make this aging society sustainable in Japan, the countermeasures securing mobility and accessibility of elderly people have been discussed for a long time in Japan and in the world. A sustainable public transportation system is evaluated to be the best solution although it is very difficult to achieve such a goal economically and socially. In addition, automated car has been considered to be omnipotent recently. However, we should know

there is quite a long way to the fully automated driving society from now. Regarding car driving of the elderly people, many studies have shown that the elderly drivers do not want to give up driving because of many factors. As a result, car driving share of all travel modes clearly increases. In Japan, the passenger cars ownership increased by 27 times from 1966 to 2016, and the proportion of elder drivers is increasing very much because of aging. Compared to 2015, the increasing rate of car drivers is approximate 0.1% in 2016. However, the increasing rate of elderly drivers who are 75 years old and older is about 7.3%. Meanwhile, the number of elder drivers will be continuously increasing in the coming 5 years.

Elder drivers are affected by impaired cognitive and visual capacity. These factors have caused more traffic accidents reasoned by elder drivers. Regarding automobile use of the elderly people, the Japanese government has released analysis reports many times on the traffic accidents. The fatalities in 24 hours caused by traffic accidents in Japan have been reduced to 3904 persons in 2016 from 6415 persons in 2006. However, the rate caused by elderly drivers is increased from 44.3% in 2006 to 54.8% in 2016. The increase of the traffic accidents share by the elderly drivers has been the serious social issue in Japan recently. Although we know that the major reason is that the percentage of the elderly people is increasing, more effective countermeasures are required. To reduce vehicle crashes due to elder drivers, Japanese government encourages elder drivers to return their driving licenses voluntarily by some incentives, such as discount tickets for taxi or buses and coupons for some commercial facilities including shopping centre and public bathhouse. The number of elder drivers surrendering driving licenses has increased by 12 times from 2006 to 2015. However, there is a significant difference between the metropolis and the local city in Japan. Compared to residents living in the local city such as Toyota City, residents living in the metropolis such as Tokyo are more likely to surrender their driving licenses, which might result from the fact that the well-developed public transportation system including buses or subways can provide transportation alternatives for elder drivers to go out for shopping or hospital. In contrast, residents living in the local city are reluctant to return their driving licenses, since most of the households are living in stand-alone houses located in suburban areas rather than houses centralized in urban areas. Private cars are indispensable for their daily activities such as leisure or going shopping.

As a good solution, automated driving is rapidly becoming the focus of attention to ensure the accessibility need of all people in the future. However, we should know that there is quite a long way to realize the fully automated driving society from now. Therefore, the most important issue goes to how to ensure the safety when the elderly people drive cars by themselves. In contrast, there are also some studies showing the elderly drivers have less traffic accidents. In addition, on the basis of the social experiment conducted in the Toyota city, the physical ability of the elderly drivers is becoming lower along with their aging. These results let us reconsider how to deal with the automobile driving by the elderly people. The positive effects of the driving should be evaluated fairly, too. In total, in the near future, the automobile driving for the elderly people should still be considered a good choice as their travel mode. Meanwhile, regarding the traffic accidents issue, the ADAS (advanced driver assistant system) technologies should be promoted more proactively in order to compensate the lower physical ability so that reduce the traffic accidents.

In this study, we have summarized results of the survey implemented in Toyota City, Japan. What we obtained from three targeted districts tell us that elderly people show similar behaviour and attitude with their mobility in their daily lives and for the future. Driving cars till 80 years old and older is expected by most of the elderly people. In order to help someone who may not be well to drive a car by himself/herself, the ride-sharing driven by other elderly people seems be good choice. By making use of the ADAS equipped cars, the ride-sharing service business which is operated by elderly drivers and is used by elderly people will be very realistic. Driving cars makes elderly drivers slow down their aging. Ride-sharing service let elderly people have more choices of travel mode so as to ensure their mobility even in the low developed public transportation system cities and areas.

Abstract

Functional thinking is a cognitive process specific to man. It enables analysis and synthesis of relations between objects and phenomena and facilitates the solution of theoretical and practical problems. Important for functional thinking are a sense of causality and dependence. In the field of education, mathematics and its applications are mainly devoted to the development of functional thinking, specifically in the topics of relationships and data processing. Recent research conducted in our Department of Mathematics focused on the use of knowledge and skills of first year mathematics student teachers in solving problems with functional content at all Czech Republic educational faculties using a non-standardized didactic test. In this article, we will discuss learning situations that support functional thinking using tasks selected from the above mentioned test. We consider the results of a qualitative piloting of mathematics teachers. It consisted of a non-standardized didactic test, non-standardized questionnaire and a space for a written evaluation of graph reading tasks and a discussion. It identifies a practice teachers reflection of the topic.

Keywords: functional thinking, teaching situations, teacher, mathematics, graphs

Introduction

Below, we will first state the basic concepts that we work with in this article, namely teaching situations and functional thinking. Then we briefly report on the research that was carried out a few years ago at the Department of Mathematics of the Faculty of Education, Palacký University in Olomouc, which we follow in this article.

Teaching is a pedagogical process in which the teacher, the pupil and the content of education are presented to meet the educational goals. Nowadays, teachers are encouraged to improve the quality of school teaching by using teaching theory, influenced by constructivism.

As stated by Češková (2016, p.532), *teaching situations* are specific in time and have locally limited encounters during which individuals are exposed to influences presented with specific learning objectives (learning tasks) by teachers, which pupils respond to in some way. We consider the learning task to be at the core of the teaching situation. Then circumstances of the teaching situation are considered to be a set of factors which may affect the inclusion of a given learning task in teaching. By external situational circumstances, we understand all the knowledge, experience and skills a pupil can use to solve a given task. By internal situational circumstances we understand the way how the learning task is dealt with in a particular lesson. According to Češková and Knecht (2016, p. 97), “the presence of problem-oriented learning tasks is a necessary condition for developing problem-solving competence in school education”. For more on this subject we refer to e.g. (Strobel & van Barneveld, 2009) and (Gijbels et al., 2005). For more details on the definition of the concept of a learning task, see (Medková, 2013, p. 41-53). Problems and their solution by pupils are among the current research topics of didactics of mathematics and are a permanent subject of interest in school practice (Vondrová et al., 2015).

The term of *functional thinking* was used at the turn of the 19th and 20th centuries by the German mathematician Felix Klein. Functional thinking is one of the cognitive processes specific to man. As the term itself emphasizes,

these are the processes involved in learning about reality. It is the activity of the brain in which information is processed. Above all, it enables to analyze and synthesize properties and relationships between objects and phenomena and solve theoretical and practical problems. Every person is born with certain inherent dispositions of intellectual abilities. The human brain likes to learn and develop, only it has to be forced into activity. The basic content of every education, as stated by current pedagogy textbooks, is above all education of thinking. If education lacks a tendency to develop the ability of thinking, this deficiency will manifest itself in emphasizing easier teaching methods. But it is impossible to think without knowledge. Necessary prerequisites for thinking are schemes of organized knowledge in our mind. Education and training in schools will ensure pupils to develop their thinking, teach them how to collect information, assess, sort and work with them independently. The development of functional thinking contributes positively to increasing the level and quality of the mind and intelligence of the individual, and its level influences the attitude to reality. A reliable path for developing functional thinking is in teaching mathematics.

Mathematical thinking can be divided into several groups: concrete thinking, abstract thinking, functional thinking, algorithmic thinking, spatial thinking and intuitive thinking.

A sense for causality of phenomena, a sense of dependence that is not directly related to the notion of a function and other accompanying phenomena of the notion of function, are important to functional thinking. It develops from the pre-school age of the individual. It is likely that early childhood education (parent consistency, causality in the family), children's literature - fairy tales (do things have their order?), etc., also have an effect on the establishment and level of functional thinking. In terms of didactics of mathematics, it is necessary to pay constant attention to the development of functional thinking.

The topic of functional thinking and the development of functional thinking in teaching mathematics at primary schools and lower grades of high schools can be found in (Eisenmann and Kopáčková, 2006).

To write her dissertation "The level of functional thinking of mathematics students at the beginning of their studies at faculties of education in the Czech Republic" (Salvetová, 2014), Leona Salvetová conducted research on functional thinking. At all 8 Faculties of Education in the Czech Republic, 305 first year mathematics teacher students, future teachers of mathematics in lower grades of high schools, entered a non-standardized didactic test with 14 problems to solve. In the research, she investigated the use of knowledge and skills of mathematics students in solving tasks with functional content at faculties of education in the Czech Republic. She presents variables in the research, research questions and their hypotheses, analysis of test tasks, determines and verifies the formulated hypotheses and deals with the issue of measurement errors. She describes research tools and its properties, non-standardized didactic test (reliability, difficulty and sensitivity of tasks) and a questionnaire in which students answered questions related to previous study at high school and university and characterizes the research set. It summarizes conclusions from statistical processing of research data and suggests recommendations for implementation in practice and further development of science and explains the contribution of the dissertation thesis to pedagogical practice. See (Salvetová, 2012), (Salvetová & Laitochová, 2012), (Laitochová & Salvetová, 2015), (Laitochová & Uhlířová, 2017).

Method

In the academic year of 2018/2019, we carried out qualitative piloting among 9 teachers of lower grades of high schools (pupils at the age of 11 to 15 years). It consisted of a non-standardized didactic test, a non-standardized questionnaire and a request for a written evaluation of graph reading tasks and a discussion.

The non-standardized didactic test consists of 3 tasks on reading graphs. Furthermore, the materials submitted to the involved teachers included a requirement for a written evaluation of the graph reading tasks. Respondents should justify the potential contribution of the tasks to the development of functional thinking, indicate the

expected difficulties with working with the task at lower grades of high schools and give recommendations for teachers how to work with the task at lower grades of high schools.

The authors used a questionnaire of their own design. The responses were indicated on a four-point Likert scale. The questionnaire consisted of a total of six items focusing on the following areas:

1. Respondents' knowledge of the term of functional thinking and ability to define the term of functional thinking.
2. Effectiveness of including reading graph tasks in mathematics classes.
3. Effect of reading graph tasks on the development of pupils' mathematical thinking.
4. Complexity of including reading graph tasks in mathematics classes in terms of the teacher's preparation.
5. Frequency of using reading graph tasks in mathematics classes by the teacher.
6. Readiness of teachers to include reading graph tasks in mathematics classes.

Submission of all completed materials was followed by a discussion of all participating teachers on the issue.

Findings

Now let's list the test tasks and their solution followed by evaluation, how teachers solved the tasks and how they evaluated them.

Task 1. The chart represents the dependence of temperature on time.

From the chart of the dependence of temperature on time, determine the temperature at 11 a. m. Circle the correct answer.

- a) 10°C
- b) 14°C
- c) 12°C
- d) 11°C

Quite an easy task, just need to carefully read the marked points on the axes on which time and temperature are plotted and fill in the missing data. The correct answer is d) 11°C .

Respondents from the ranks of teachers did not miss this task, so the success rate of the solution was 100%.

Let us give some teachers' comments on this example:

They see the contribution of the task to the development of functional thinking in the fact that the example develops an idea of the course of a dependent variable in a practical situation, "the temperature rises during the day and falls in the evening", furthermore, the example helps with orientation on the numeric axis, realizing that "only one temperature can be assigned at a time", "an image is worth a thousand words".

They report a problem with a "rough" scale as a possible difficulty, there is not enough data on the axis.

Recommendations for teachers: "To emphasize that this is not an end in itself, similar graphs are used not only by meteorology, but by physics (performance, torque versus speed), pharmacology (course of drug levels over time), etc.", "pupils see temperature change during the day - linked to science, geography or the problem of dressing", "recommend adding numbers to other points", "emphasize determining the size of one scale interval".

Task 2. A car, a pedestrian and a cyclist are moving along the same road. The chart represents the dependence of their trajectories on time. Determine after what time the cyclist met with the car.

Intermediate task, the graph contains three path-time curves. It is important to note that the cyclist leaves an hour after the pedestrian and the driver of the car. There are two ways to answer that: the cyclist and the car met 2 hours after the cyclist started or, equivalently, 3 hours after the car started.

Respondents of teachers achieved a success rate of 55.56%. It was only 5 out of 9 teachers that correctly solved the task. Here we must point out that inaccurate answers are incorrect answers.

Let us give some teachers' comments on this example:

According to the respondents, the benefit is the creation of a "visual conception as a basis for solving motion problems", "the value of the directive specifies speed", it is possible to develop considerations about speed. Teachers see the difficulty in explaining that "when the car is stopped, time runs on, so it does not stop in the graph, so the course is parallel to the x-axis", "cyclist embarks on a journey later than the car".

Recommendation: "to demonstrate the difference between a graph of path dependence on time and a graph of speed dependence on time", "teachers should emphasize the connection to physics – an average speed " (the movement of the body is discussed in physics in the 7th class), "to color differently the individual curves ", "to discuss with students whether they understand the assignment". One respondent sees a link to road safety.

Task 3. The charts on the right represent the dependence of the area of the shaded part of the triangle $S(x)$ on distance x . Only one of the charts corresponds to the situation. Circle it.

Difficult task, correct answer is B.

It should be noted that the graph we are looking for describes the hatched area of the triangle, depending on x . The area is not represented by a number. The point is to realize how the area changes with increasing x . The area increases with increasing x . This eliminates options A and D, because each graph has a region of decrease. Both options B and C seem to be possible. However, the area $S(x)$ does not grow linearly, which eliminates option C. The answer is option B. For this reason we can recommend to think about a similar task, which is created by replacing the triangle by a rectangle, whose one side lies on x -axis, in the original task. This task 3 can be solved “intuitively”. Of course, solvers with knowledge of integral calculus can use knowledge about the geometric meaning and applications of a definite integral.

Respondents of teachers achieved a success rate of 22.23%. Only 2 out of 9 teachers solved the problem correctly.

Let us give some teachers' comments on this example:

Only one respondent shows enthusiasm over this interesting task, most teachers think the task is too difficult. Teachers mostly recommend this task only for analysis with talented pupils or students of grammar schools, or as a supplementary task for students of lower grade of high schools. Two interesting ideas appear to be recommendations for teachers. The first one is the calculation of shaded parts for different x values, the second one is to illustrate the situation (“for example, when filling a container with water, fast inflow versus slow inflow - explain that slow inflow is still inflow, not outflow”).

Results, Conclusions and Recommendations

The following table shows the success of the three tasks in the case of the 2013 research conducted on first year students of all faculties of education in the Czech Republic (in the table briefly marked Student305) and in this year's survey with 9 teachers (briefly marked Teacher9). Obviously, the comparison is not indicative, the sample of teachers is small. The sample of teachers is small because we only performed qualitative piloting with them.

	success rate % Student305	success rate % Teacher9
Task 1	81,6	100
Task 2	73,8	55,6
Task 3	7,2	22,3

Finally, let's give a brief evaluation of the questionnaire. Most respondents state that they do not know the concept of functional thinking. None of them tried to give a definition of this term. Nevertheless, all respondents consider the inclusion of graph reading tasks as effective in the development of mathematical thinking and believe that these tasks contribute to the development of pupils' mathematical thinking. In view of the difficulty of preparing a teacher for a lesson with graph reading tasks, some teachers think that preparation is rather easy and the same number think it is rather demanding. The most varied answers were obtained for the question "How do you evaluate your current readiness to work with graph reading tasks?" One respondent replied "unprepared", two "rather unprepared", five "rather prepared" and one "prepared".

The benefit for all participants was the subsequent discussion on the issue. It first focused on the evaluation of examples. For Task 2, the issue of clarity of the task was discussed as well as the problem of divergent tasks was discussed. Task 3 led to a discussion on the difficulty of the task, problems pupils have with understanding the verbal tasks and modeling tasks.

Teachers agreed that the reading graphs tasks are useful and can be linked to everyday life: everyone encounters charts and graphs frequently, for example in newspapers and on the Internet. Working with graphs also supports the development of mathematical thinking. Most teachers tended to believe that modeling of mathematical situations is appropriate but challenging. They see the potential of using computer technology for graph tasks, they just need a background in suitable software.

In conclusion, tasks to promote functional thinking, specifically graph reading tasks, are important and necessary for the educational sphere, and need to be included in the classroom to a greater extent and already teacher students should be trained for that.

As one respondent wrote, "a graph is worth thousands of words, it just needs to be understood".

Directions of formation of favorable competitive environment in Azerbaijan's leasing services market

Sevda Mammad HUSEYNOVA¹

¹*Azerbaijan State University of Economics (UNEC)
International Center for Graduate Education, secretary
Email: huseynova.sn@gmail.com*

Abstract

The article is dedicated to investigating existing competitive environment in the Azerbaijani leasing market, analyzing criteria and indicators characterizing it, identifying the ways in which the leasing company's marketing policy will be enhanced, and disclosing directions for the formation of a competitive environment in the country's market. For this purpose, the author has examined the major aspects of theoretical competition in the article, highlighting the competitive advantages of the leasing services market as well as the elements of the marketing mechanism that effectively operates in the market (price policy, frequency of services provided by leasing companies, intensity of consideration of initial leasing documents and claims), terms and conditions of leasing deals, advanced information technologies, corporate information systems, including the use of the Internet), the features of price formation for leasing services were disclosed, and SWOT analysis of Azerbaijani leasing market was conducted. In addition, the article highlights the importance of choosing the main strategic directions and competitive methods in the leasing services market, and has made relevant proposals to improve the leasing company's marketing policy as well as the formation of a favorable competitive environment in the leasing market of Azerbaijan as a whole.

Key words: leasing, services market competitive advantages, competitive environment, price formation, marketing policy

Introduction

In most of the companies and organizations intending to use leasing, a number of important issues appear, as one of the most attractive financial instruments for solving issues of renewal of key production assets. For example, do leasing business operators have the option of free choice, and which leasing companies are eligible to interact with, taking into account their business conduct? All these issues are directly related to the problems of competition in the leasing services market.

Theory and literature review

Selection of the price formation method in the leasing services market depends on both corporate interests and competition in the market. Well-known competitor Robin Cooper focuses on three major aspects of competition: price, quality and functionality (*Газман В.Д. 2006, 148с*). It can be logically considered that these components are directly related to competition in leasing business.

Because prices and quality are more standardized, competition sharply turns around leasing services functionality. This situation is characterized by flexible competition. This means that the strategic success of the leasing as a whole is that companies are finding that they are quiet and hasty in dealing with new projects and sources of financing for these projects (*Портнер М. 2005*).

The achievement of a larger share in the market is not always a goal for economic entities, including leasing. First of all, the company directed to the maximum value for its proprietors must meet the following conditions:

- Profitability;
- Positive cash flow;

- High profitability from capital investment;
- Not only high accounting profit, but also high economic profit.

Competitive advantages in leasing services market

Professor of Harvard University, Michael Porter called these factors competitive advantages (*Дейли Джон, 2004*). John Dale, a well-known consultant in the field of assessment, thinks that effective price formation is the basis of competitive advantage (*Самуэльсон Пол Э., Нордхаус Вильям Д, 2003*).

We consider that Azerbaijani leasing companies should be more prone to the advantages of the following rates at the current stage of economic development. These advantages include the elements of a marketing mechanism, which directly work from the very first days in the market:

1. Price policy. Based on this, leasing companies offer various offers to the market using price manipulation for their products.
2. The intensiveness of the services provided by the companies that are in the leasing relationship, the consideration of the initial leasing documents and claims.
3. The term of signing of leasing agreement. Of course, the size of the monthly lease payments is dependent in this process, and this does not assume little significance to the choice of a company for the customer. It should be noted that, while determining the lease term, the leasing company takes the lease's liquidity, its value, and other factors.
4. The use of advanced information technologies, corporate information systems, including the use of the Internet.

Information about competitors is not limited to information about the prices offered only on leasing services offered. To compete, you need to have information about the conditions that are set by leasing companies- information about the types of products, contract terms, advance payments, and real increasing in leasing.

Formation of prices for leasing services is a strategic activity aimed at long-term prospect, as well as long-term outcomes that takes into account both consumers' and competitors' reaction. The price decisions of leasing companies can be taken in a number of circumstances, proceeding from the interests of signing of any certain agreement. However, this is a tactical decision, which, as a rule, is intended to maximize its profit or, to the contrary, comprise to the leasing agent.

The western countries have the practice of applying indicators that characterize the level of competition through the concentration and monopolization of the market. Thus, the US uses these indicators to make it clear that state authorities must be aware of the necessity of intervention to market mechanisms. Demand for such intervention occurs while considering market power rate of one or more enterprises, or more correctly, their excessive effects on their prices and production volumes.

The concentration ratio is used to measure market power. This ratio represents the share of four large enterprises in the field of production. In the case of net monopoly, the concentration will be about 100%, while in the competitive period it will be close to zero.

According to the estimates of American economists Paul Samuelson and William Nordrose, the high degree of concentration is that the share of four large companies in total production exceeds 60%. Low concentration occurs when the share of four large companies in the total output is less than 20%.

If the leasing company enters the market now or introduces a new type of service to the market, all the information about competitors is important. Therefore, the competitors' cardboard should be created in a definite way and it should be renewed and completed on a regular basis.

In the leasing services market, information collected on competitors can be quantitative and qualitative or actual and subjective.

As a rule, quantitative information answers the following questions:

- What kind of organizations can be competitors of the company?
- What services do companies provide, how and in what areas do these services?
- Who are the main customers of the companies?
- How do companies integrate their services into the market, how do they create favorable conditions for selling services?

However, the availability of emotional or quality features is crucial in evaluating of the services in the leasing service market due to the individual acceptance of services and by whom. Such information will always depend on it.

Qualitative characteristics can be included recognition of the entity, the professionalism of the staff, the quality of the service, the customer's loyalty, the entity's management, the marketing strategy and other non-formal indicators.

When it's time to collect real information, the peculiar analysis of many aspects of the opposing side requires intensive mental work.

In the leasing services market, collection of information about the opposing party is very different, and this is related to the creativity and professionalism of the company's staff. It is possible to create a list of opponents by utilizing many sources of information, adverts, and publications in the media.

Nowadays, it is not difficult to gather data on the most advanced enterprises in the leasing market with information and communication technology, mainly from the websites of the mentioned enterprises. Even it is also possible to get more useful information about competitors by using the services of the opponent party.

Collecting the above-mentioned information becomes easier when the service market is expanded to the area different from the product market. More precisely, this market is considered to be a local market. This is due to the fact that the service is not felt: it is also impossible to carry the services.

In the leasing service market, general information about the work with information systems is also applicable to information collected on competitors: it is necessary organizing the systematic gathering, evaluation of information, analyzing this information by experts, and organizing transmission of information to decision-makers.

However, it is required to consider the form of creating cardboard cards and its ways of checking it over time. When it comes to competitive advantage in the leasing service market, it is understood that sensory and non-sensitive rare assets belong to the firm. Competitive advantages are a different kind of activity where the strategy of business is very important factor to win the competition. Competitive advantages arise when the company earns more than the average income of its competitors or the market segment.

While defining competitive advantages in the leasing service market, referencing to customer inquiries, it is needed to ensure that competitive advantage is perceived by the company's customers. It is very characteristic for Azerbaijan that the enterprise believes that it has competitive advantages, but the consumer is unaware of it.

Practically, we can see that, depending on the characteristics of the field and the market, there are many types of competitive advantages. In today's competitive environment, the company has to have several (4-5) competitive advantages as a rule. The competitive advantages of the leasing service market may be as follows:

- Famous name;
- Professionalism and practice of employees;
- High quality of service;
- Personal contact with customers;
- Putting the consumer, his inquiries and desires into the foreground;
- Favorable conditions for the sale of favorable advertising and services;
- Development of branches, admission points;
- Being in a strategic area;
- Good material base (staff, money, equipment);
- Additional service complex.

Taking into account these factors, it is expedient to note that the SWOT analysis of Azerbaijan's leasing market is as follows in the table below.

Table. SWOT analysis of leasing market of Azerbaijan

Strength	Opportunities
1. State support to leasing programs in priority areas of economy. 2. Uniform licensing and adaptation of leasing legislation 3. Tax, amortization, customs, investment concessions and privilege when implementing leasing projects 4. Simplification of judicial and administrative procedures during the confiscation of leasing subject from unfair leasing holder. 5. Transition of Leasing Companies to International Financial Reporting Standards (IFRS). 6. State-specific partnership during leasing operations	1. The use of leasing as one of the effective instruments in the implementation of strategic, nation-wide and regional development programs 2. Introducing new leasing programs, products and services 3. Diversification of financing sources of leasing activities, including Islamic finance. 4. Extensive use of the stock market mechanism for the development of leasing services 5. Creating conditions for the active involvement of foreign investments
Weakness	Threats
1. Unsteadiness of existing (commercial) leasing companies in the market 2. The unsteadiness and shortage of the leasing companies' stock base 3. Lack of "long" and "large" money in the investment process 4. Insufficient transparency of leasing companies 5. Absence of qualitative statistical reporting and information 6. Insufficient branching of commodity, field, and regional structure of leasing contracts	1. Strong foreign leasing companies' access to the Azerbaijani market 2. Unsteadiness of leasing legislation 3. Increase in inflation, increased cost of financial resources attracted by leasing companies 4. Deterioration of the quality of assets and leasing portfolio as a whole, increasing the risks of leasing operations

Selection of basic strategic directions in leasing services market

As a rule, competitive advantage can be considered as the basis for a separate leasing company strategy. The general direction of the leasing services market can be summarized as follows

- low-cost strategy; Nevertheless, it should be noted that competitive advantage prevails when low costs are achieved at the expense of less production costs compared to competitors;

- differentiated service strategy, i.e. the strategy of adapting the service to the needs of specific consumer groups;
- A strategy of innovative companies offering new services.

It is clear from the above that the company can more accurately determine its position in the market on the basis of analysis of competitive environment in leasing services market, and as a result, the company's position in the market can be strengthened and its successes can be further enhanced.

Comprehensive information about competitors helps to compare and regularly analyze the quantity and quality of leasing services, allows the market service experience of the leasing service company to be more competitive.

Regardless of the level of development of market relations in the republic, the fight against monopoly in the market and protection of competition are the main directions of the state's economic regulation function. The fight against unfair competition is regarded as an urgent matter regardless of the law of the leasing services market, the tradition of traditions and culture.

Competition is one of the factors influencing the production and sale of production facilities in the leasing market. In competition, prices and non-price methods are used. Price competitiveness leads to economic pragmatism in the market, and non-price competition improves sales methods, concessions, and advertising. It is important to note the importance of price and tariff regulations in this area.

There are conditions for the expansion of production of leasing services in our republic. However, demand for these products is currently being paid mainly through imports. Organization of competitive leasing services in our republic is one of the main tasks ahead. The competition fight reflects the natural state of market relations and is critical to the development of the competitive market. Competitiveness is also crucial in accelerating scientific and technical progress, as well as promoting the application of progressive forms of labor organization. In the market economy, domestic producers face with competitive environment in the domestic market rather than in foreign markets. One of the main tasks in this regard is to develop a competitive environment in the market. As a mechanism providing macroeconomic balance in the market economy, our country has created a necessary legislative base for competition development (the Constitution of the Republic of Azerbaijan, Anti-Monopoly Activity, Laws of Unfair Competition, Law on Advertising, etc.).

Leasing company's marketing policy and its improvement

Distinctive features of the leasing company's other business activities have a direct impact on the leasing company's marketing activity. The leasing company's marketing policy implies the marketing functionality of all levels of the leasing process and the implementation process of marketing philosophy and tools at all levels of the leasing process, which involves the realization of the marketing function in order to generate and reclaim the demand and the interests of the firm.

Relations with customers, banks, insurance companies are long-term and stable, where relationships with customers are largely discrete in leasing transactions. Thus, in the sphere of leasing services, marketing combines the principle of service marketing with respect to consumers, as well as the mutual influence marketing in relation to the remaining counterparties. This is conditioned by the specific features of the leasing.

From a marketing point of view, the mutual influence in the leasing industry is not only an essential element of entrepreneurial activity in the implementation of a business project, but also a prerequisite for contractual relations between all subjects of the leasing process, and allows each of them to achieve a certain level of profits through exchange of performance and results in long-term establishment of relations.

The mutual impact marketing for the leasing company demonstrates the multifaceted development of mutually beneficial forms of cooperation in the leasing industry, which is aimed at simultaneous involvement and use of all resources (human, mental, financial and material) to meet the requirements of the key leaseholders.

In order to achieve this, it is necessary to continually reconcile the marketing tools used with the changing requirements of the enterprise structure.

When formulating a marketing policy, a leasing company can use many marketing strategies. One of the most important types of leasing company's successful activity is the provision of financial efficiency. Here, key marketing strategies are strategies for increasing revenue and strategies to increase sales volumes.

A number of marketing strategies are used by leasing companies: additional functional development strategies (operational leasing, staff leasing); strategies for choosing perspective investment projects; a strategy to attract private equity and to attract less financial resources; a closer interaction strategy with suppliers; strategy for mastering new segments; commodity diversification strategy; a unique specialty strategy; portfolio diversification strategies; customer service strategy.

Stable positive trends in the Azerbaijani economy stimulate leasing companies to adopt new customer segments, especially through the introduction of new leasing services in the world. In addition, reducing marginal earnings of a leaser promotes strengthening of the company's marketing interest in the expansion of the portfolio, as well as intensifying the development of the product and the overall customer service level.

As for the number of leasing companies in Azerbaijan, the issue of their specialization is undoubtedly topical, as is the case in other countries where this sphere has already gained momentum. It can also be linked to the development of the non-oil sector in the strategic direction. Local leasing companies can be involved in serving certain government projects that will be implemented in various sectors of the sector.

Result of research

1. We believe that the main factor of the success of the leasing company in the market is the understanding of the marketing as integrated

Thus, it is offered to look at marketing within the leasing service in several ways:

- Leasing companies' marketing activities are a tool for managing decision-making to ensure the company's long-term and sustainable success. Improving its marketing policy envisages a change in the organization that creates the competitive advantage of the leasing company. Therefore, it is necessary to apply the standards of the company's restructuring and the procedure for the provision of leasing services.
- The leasing company's marketing activities should be viewed as a set of measures to interact with hardware suppliers and financial insiders. Here, marketing focuses on the acquisition of competitive advantages through a market-specific marketplace.
- Marketing activities in the leasing services industry should be viewed as the principle of the company's activity, consisting of the entire business of the enterprise consistently directed to the needs and needs of potential consumers. The leasing company applies a customer-oriented approach, where marketing is governed by the principle of enterprise management. Clients for leasing provide customers with leasing services understanding of their customers' needs and finding solutions to their problems. In this case, it is necessary to take into account market competitive advantages in relation to the price, quality and timing of the leasing service.

2. It is expedient to reflect the leasing opportunities of the national road map and its key sectors in the currently developed strategic roadmap. As it is well known, special attention is paid to priority directions of development of non-oil sector of Azerbaijan economy. It is necessary to note the creation of regional innovation zones in Azerbaijan, especially technics and agrarian parks of high technologies. In this regard, great prospects are opened for leasing. Thus, the main means of residents of these high-tech production facilities can be organized and can then be upgraded through leasing. Additionally, with the help of leasing, their goods and services can be realized in domestic and foreign markets. Therefore, in the development of technological and agropark development programs, in our opinion, it is necessary to consider the full potential of leasing business in solving their creation and activity.

3. Cancellation of VAT assigned for imported leasing objects in 2016 can be considered the most important step taken in this area. Thus, as most leasing companies failed to compete with banks because of VAT, the portfolio of leasing companies was transferred to the hands of banks. The adoption of this decision can be regarded as commendable. It is also important that such a decision be taken too soon to the real sector.

4. There is a great need for intensification of leasing application in the agrarian sphere. The Agroleasing Company is currently financed by the state budget on favorable terms. Leasing of technical equipment to the agrarian sector entrepreneurs with a low interest or interest rate would further strengthen this process. However, the lack of proper functioning in this area is a delay in the current process. Therefore, it is absolutely necessary to attract other leasing companies to that process. As a result of the benefits of the Agroleasing privileges and concessional financing, fair competition is created and the difficulties in obtaining the equipment they require are being abandoned.

5. Innovative leasing products should be brought to the republic in order to ensure the leasing development and achieve its international presence. Implementation of Islamic leasing in the country may be a new stage in the development of leasing sector in Azerbaijan. First of all, it is necessary to train the skilled cadres of the country in order to bring the Islamic leasing, or rather, the lease to Azerbaijan.

Development of the leasing sector in Azerbaijan can play a key role in the development of national economy. This, in turn, can ensure domestic demand and stimulation of export-oriented production.

The Relationship of Cognitive Functions and Ability of Cooperation and Social Maturity

Michaela PUGNEROVA ¹

¹Res. Asst., Department of Psychology and Abnormal Psychology, Faculty of Education, Palacký University Olomouc, E-mail: michaela.pugnerova@upol.cz (Czech Republic)

Abstract

The presented paper aims to present the results of the pilot study of the issue and preparedness for the school of children in the Czech Republic. When starting compulsory schooling, the child's cognitive competence is usually assessed to predict the child's success in the teaching process. However, the child's ability to integrate into a group of classmates, to carry out common activities with them and to contribute to the creation of positive school class relationships also plays an important role. The research was carried out in order to map the level of preparedness for school for pre-school children in the kindergarten. The MaTeRS method used (Vlčková, Poláková, 2013) makes it possible to assess the developmental level of the child. In the partial research is assessed relationship of the level of cognitive competences and social adaptability skills of the child. Social adaptability is characterized by emotional maturity, social maturity and the ability to cooperate with other children. The research group consisted of 100 children of pre-school age in average age $5,74 \pm 0,71$ years. For the given research, the ethics committee obtained approval from the author's department. The research was realized by those kindergartens where their management agreed to cooperate within the research. Furthermore, the agreement of the legal representatives of each child was obtained. The purpose of the communication is to compare and update the survey of children's readiness for the school with other studies focused on the monitored area. The research was supported from grant IGA_PdF_2019_015. Mentioned problematics in this age category has not been studied further. At the same time, not only cognitive, but also social competences also contribute to the success of a person in different levels of education and last but not least in professional life.

Keywords: pre-school, maturity, cognitive competence, society

Introduction

In the area of school legislation, school maturity is understood as a condition for starting compulsory school attendance after the age of six, when the child is physically and mentally developed (Průcha, Walterová, Mareš, 2003). The issue of a complex assessment of the level of readiness of a particular child to start compulsory school attendance or a decision to postpone it, if any, is a crucial issue for its further development. Pre-school age is a significant period in the life of a child and his family, especially in the context of two changes, namely the crossing of the family framework and inclusion in institutional pre-school education, and at the end of the child's entry to school. As early as in the 60s, Jirásek (1992) stressed the importance of preparing a child to entering the school and states in this context that all children, not just children of employed mothers, should go to kindergarten because they has their own representation in pre-school education, which cannot be replaced in many ways by the best family education. The main goal of pre-school education is to achieve school maturity. It is called "education for schooling". Kováčová (1979), Bednářová, Šmardová (2010) also emphasize the importance of pre-school education and state that all aspects of the child's psyche are being developed and thus become an irreplaceable element to family education. Although many studies mention the positive impact of pre-school education, it is very difficult to distinguish its influence from the influence of spontaneous development and education within the family environment (Šmelová et al., 2012). In pre-school age, cognitive processes that are important for the perception and cognition of objective reality are significantly developing (Klenková, Kolbábková, 2003). According to Říčan (2009), perception is crucial when entering school. Perception forms the essence of knowledge and mediates direct experience (Kolláriková, Pupala, 2001). According to Vágnerová (2012), perception in pre-school age is global, non-analytical, focused on what the child is currently experiencing, or what is attracting his/her attention in the moment. At pre-school age, children face problems of orientation in time zones (yesterday, today, tomorrow). Visual perceptions dominate in the development of

perception. At the end of pre-school age, there is a development in the area of visual differentiation. The child is able to see the differences in the details in the picture, distinguishes the number and shape. The child then uses this ability in the process of distinguishing letters. An important role in pre-school is represented by imaginations, which are very colorful and rich. Gaps between perceived actions or individual details are often supplemented by so-called child confabulation (Šulová, 2004). These are fictional ideas that the child considers to be real. This phenomenon is called as eidetism (it may occur in some individuals for the whole life). Attention span is very short in pre-school children. Intentional attention can be developed and improved in the form of constructive games, but also, for example, domestic duties. Unwitting and mechanical memory predominate. As a result, children can easily remember different nursery rhymes or songs. They are looking for no meaning, content, but just focusing on rhythm and rhyming. At this age, children receive information both by mechanical learning and at the same time it is desirable to arouse interest in logical thinking, e.g. by telling a stories (Šimíčková et al., 2010). There is a big change in thinking in pre-school children. The child crosses to visual and intuitive thinking. Thinking is still egocentric. We talk about conceptual thinking at the end of the pre-school age, when the child uses thought operations such as analysis, synthesis and comparison. Typically, a child is unable to focus on multiple phenomena/actions at once. As for visual-motor and graphomotor development, it is obvious that motor skills relate to child's development. Movement and manipulation with small objects allows children to explore the world, play and become independent. In this period, the child should also be able to handle the drawing, especially the drawing of a figure with all the elements that belong to it (Šturma, Vágnerová, 1992). From the point of view of social and emotional development, a typical emotionality is typical for a pre-school child (Vágnerová, 2005). This period is important in shaping basic emotional manners. The emotional experience of a child is very intense, short-term and changeable. Pre-schoolers are able to control their emotions, they can reflect their mistakes, be able to regret, evaluate their behaviors and express dissatisfaction with their actions (Šulová, 2004). Typical is usually a cheerful mood, associated with the declining fear from the unknown. Social feelings such as love, friendship, hate, sympathy are at the forefront. Among the peers, cooperation, competition and development of empathy towards other people (Šulová, 2004) is developing. Most pre-school children want the company of their peers, seek contact with them, and friendship begins to form. The kindergarten is important for this period, thanks to which the individual gets contact with other children in the form of games and cooperation (Matějček, 2013). Successful management of school achievement is also influenced by emotional stability, coping with stressful situations and the ability to cope with possible failure. Hypersensitivity can lead the child out of balance. Fear, worry, and tension can cause poor pupil's performance. Emotional maturity is also related to social maturity. It is very important that a child is able to separate from his/her parents for several hours a day, listen to a teacher, know how to cooperate and perceive a teacher as an authority. An important part for coping with these critical situations is the ability to participate in the collective, communicate, cooperate with classmates, and a degree of conformal behavior towards authority and peers (Řičan, 1991, Cakirpaloglu, & Řehan, 2007, Cakirpaloglu, 2005). An important prerequisite for school success is understanding the difference between play and duty, as well as a positive attitude towards learning, emotional stability and the ability to resist frustration. Here we encounter the term "emotional intelligence" (Černý, Grofová, 2017). Its elements evolve mainly in early childhood, and the child's emotional abilities accompanies the child in the future. Emotional intelligence largely contributes to the pupil's success at school. One of the main motives of learning is a positive emotional relationship to school. Researches suggest that a pupil, who is emotionally and socially mature can better conform to a certain regime. Children, who attended kindergarten, are better prepared in this matter (Spáčilová, 2009). In this context, the Ministry of Education and Sport has taken a major step towards introducing a pre-primary education obligation in the Czech Republic since 1.9.2017 (Pugnerová, Dušková, 2019). This decision is based on the premise that pre-school education increases the chances of school achievement at the beginning of the educational period (ČŠI, 2019).

Research problem:

Currently, there is a growing tendency to postpone compulsory school attendance. It is estimated that the proportion of school postponement should not exceed 2% of the population year. These statements are based on the research from 2013/2014, when 38% of school attendance postponements were based on parents' own decisions (Pugnerová, Dušková, 2019). These are the facts that raise a high importance of mapping children's readiness for school (Šmelová et al., 2012).

Research questions:

Based on the research problem, we have identified three research questions:

RQ1: What are the differences in cognitive functions in the context of school readiness in terms of gender?

RQ2: What are the differences in social maturity in the context of school readiness in terms of gender differences?

RQ3: What is the relationship between cognitive functions and social maturity in the context of school readiness?

Method

The MaTeRS method was used in the research (Vlčková, Poláková, 2013). This is a standardized test within the DIS project "Diagnostics of Children and Pupils with Special Educational Needs" (CZ.1.07 / 1.2.00 / 14.0122), which was designed based on the empiricism of the pedagogical-psychological counseling staff. The starting point was the screening of school readiness in the child's natural environment (in kindergarten), which the child is attending. This eliminates the feelings of uncertainty and unsuccessfulness of the child in the test situation. MaTeRS can be administered in groups or individually. The authors point out that the test is tentative and generally maps: attention, maturity, work pace, degree of cooperation and overall social maturity, emotional maturity, level of speech skills, motivation for school attendance, interests and leisure activities of the child. The group part is administered in a group of a maximum of 10 children and maps the drawing of the figure, visual motor skills, graphomotorics and visual distinction. The individual part maps spatial perception, distinguishing of geometric shapes, hearing perception, numerical concepts, general knowledge and visual distinction. In the research, a group administration of 101 respondents was carried out, the number of boys was 50 and the number of girls 51, in the average age 5.1–6.9 years. These were children without postponement of compulsory school attendance and no specific needs. Data was processed using STATISTICA statistical software (version 13.4.0; Tibco Software, Inc., 2019). The analysis of the distribution of the individual results confirmed the normal distribution of the data and therefore parametric statistics, in particular descriptive statistics, Spearman correlations, T-test and Mann-Whitney U-Test were used. Testing was performed at $p \leq 0,05\%$ level of significance.

Findings

RQ1: What are the differences in cognitive functions in the context of school readiness in terms of gender?

The obtained data were processed by T-test. The results of the research showed that the differences between boys and girls were not significant (boys: $M = 38.92$, $Std.Dev. = 4.64$; girls: $M = 37.01$, $Std.Dev = 6.54$), at a significance level of $p = 0.09$; $t = 1.68$. It could be said that school readiness for girls and boys was comparable, almost balanced.

RQ2: What are the differences in social maturity in the context of school readiness in terms of gender differences?

The data were processed by the Mann-Whitney U-Test. The results of the research showed that the differences between boys and girls occurred only to a small extent, differences were not significant (boys: Rank Sum =

2474,00; girls: Rank Sum = 2677,00; $p = 0,46$). It could be stated that the social maturity of girls and boys was comparable, almost balanced.

RQ3: What is the relationship between cognitive functions and social maturity in the context of school readiness?

The obtained data were processed by the Spearman correlation method. The results of the investigation confirmed significant positive correlations. Cognitive abilities positively correlate with social maturity. Statistical processing was at the significance level $p = 0.05$ (see Table 1).

Results, Conclusions and Recommendations

The traditional issue of school maturity and the readiness of a child to start compulsory school attendance is a crucial issue in the broad context of school success or failure. The threat to the child in terms of his performance failure and the associated emotional social frustration is critical at the beginning of the way to education and future employment. All existing measures aim to develop conditions for optimizing the psychological development of children and therefore should be assessed primarily always in terms of the benefit of a particular child (Šmelová et al., 2012). In order to update the knowledge in this area, we have asked three research questions in the submitted paper. The first RQ1 concerned the finding of the existence of differences in cognitive functions in the context of school readiness in comparison of boys and girls. The subject of the research was dominantly graphomotoric, drawing and visual-motoric expression of children. The results of the investigation showed that differences between boys and girls occurred only to a small extent, differences were not significant. The same results were achieved by Šmelová et al. (2012). Nevertheless, the result surprised us, because the researches that show the existence of the anticipated differences is rather predominant and also empiricism is continuously strengthening this thesis. E.g. Bačová (2008) states that despite the numerous researches, there is still no clear answer to the question whether women and men (formerly boys and girls) are psychologically different. Perhaps the best answer is yes and no. Approaches are looking for a causal model of behavior of women and men in the spirit of the "innate vs. gained". In doing so, they prefer either biological or social influences, or seek to merge the contradictory explanation into a single - interactionist biosocial model. The differences between boys and girls have strong biological roots, which are generally reinforced by education. Boys are exposed to stimuli other than girls since early childhood and are rewarded for other behaviors (Low, 1989). Farkašová (1984) investigated parental behavior towards preschool children and found that parents behave differently to children depending on gender. In general, they are more strict to daughters, more demanding and punishing them more often. Matějček and Kadubcová (1984) state in their research that children react differently to parental acceptance or refusal, i.e. to a kind of parental warmth, and more dependence on its quality was found in boys. Matějček (2013) also draws attention to the disadvantageous position of boys from our authors. Novák, (1982) states that, for example, the level of verbal competence of children is considerably different. At the beginning of school attendance, some children are handicapped by failing to estimate their knowledge adequately, referring to the fact that differences do not arise during school attendance. At this time, they are already fixed, but the origin of the differences is, according to the authors, formed earlier, in the pre-

school age, or in the period of accelerated language development, when children rely primarily on the level of communication in the family. Authors draw attention to the possibility of a complementary program of verbal training especially for children with shortcomings of speech-communicative skills. They demonstrate the success of the method of association training on verbal alertness in girls, with the best progress being seen in children at the beginning of the average and below average follow-up. Kürti (1986) found a significant difference in academic achievement of Hungarian children in terms of gender, in favor of girls. Since her research group did not differ significantly in the measured intellectual abilities, the author assumes a higher level and effectiveness of schooling for girls. The author states that outer factors are strongly involved in shaping school achievement, and to a greater extent in girls. The most important factors of benefit are the ability to learn, fluid intelligence and outer factors - as an important part of performance motivation. However, performance motivation (Mareš, 2013) significantly correlates with neurotic tendency in girls; in boys, the relationship between performance motivation and neuroticism is negative, hence does not endanger their emotional stability as in girls. The second research question RQ2 investigated the differences in social maturity in the context of school readiness in terms of gender differences. Also there are no statistically significant findings in terms of gender differences. This is the same as the earlier studies, e.g. Diešková (1984), which states that other tasks by the child according to their gender are already assigned to the child at pre-school age. The author devotes herself to social readiness for school and believes that differences in intellectual between boys and girls are negligible in preschool age. On the other hand, the author of the currently used Orientation Test of School Maturity Jirásek (1992) proves a significantly better school success in girls, which confirms their better school maturity. According to him, the developmental advance of girls is about a quarter of a year in the preschool age. The most noticeable differences show up in activities with manual skill and senso-motor coordination. In performing tasks, girls tend to be more careful. The difference in mental abilities among children by gender does not only lie at the unequal pace of their pre-school development, but also has social causes. Elementary school attendance is the same for children of both sexes, placing the same demands and requirements on boys and girls, but better suited to girls (Janosova, 2008), as they have a greater chance of success due to more frequent reactive type of intelligence. Boys are more spontaneous in their thinking, their mental activity is more often based on their own stimuli and has more often signs of creative work (Pašková, Salbot, 2009). This feature of the boy's psyche is, on one hand, a valuable contradiction of unwanted mechanical learning, but on the other hand it can be the cause of school boys' failures. The third research question RQ3 assessed the relationship between cognitive functions and social maturity in the context of school readiness. The statistical processing revealed a positive correlation. The success in cognitive processes in the school readiness test thus positively correlates with social maturity. Child with well-developed cognitive processes also seems to be more socially mature. It can be said that it is a personality and cognitive harmony corresponding to a mature pattern of personality structure and dynamics. One cannot forget the connection with the development of the child's morality (later an adult). If cognitive processes, social maturity and moral development are consistent, we are talking about the post-conventional stage of moral development (Piaget, Inhelder, 2014). According to some authors (Musil, 2006), only about 25% of Americans reach post-conventional levels in adulthood. Other research points to the problematics of social maturity of pre-school children. Langmeier and Krejčířová (2006) report that, in assessing the school achievement of the first class children (N = 264), the youngest and oldest children, they found significant differences between the youngest, in many ways, not only in trivia but also in music, arts and physical education. At the same time, the youngest children showed themselves more indifferently, unruly, unfocused and were too playful (working and socially immature). Ohnheiser (2019) followed the most frequent manifestations of adaptation difficulties of children at the entrance to kindergarten: maladaptive manifestations were apparently found in 93%, possibly due to social and emotional immaturity (frequent crying of children and nostalgia for parents). Rausová (2014) states that rejection of contact with children and adults is at the root of the problem, resulting in crying, complaint and somatic manifestations. The Ministry of Education and Sports of the Czech Republic makes great efforts to develop social literacy and social competences of primary and secondary school pupils (ČŠI, 2019).

In the context of changes in pre-primary education in recent years (the introduction of pre-primary education obligations since 2017), there is a continuous debate on the quality of children's readiness, which seems to be crucial for later school success. Evaluation of the results of the presented research can provide a basis for possible practical precautions in the field of education, as well as for further refinement studies.

Abstract

Today, many researchers in the world include international comparative studies in their studies more increasingly. Since higher education policies shape societies, its importance is increasing. When the literature is examined, it is noteworthy that comparative studies on higher education have increased. In this study, higher education policies in Finland and Turkey are analyzed comparatively in the context of academic, economic, political and social perspectives. In addition, the integration of the principles of sustainable development and international policies into the activities of universities has been examined in this study. When the findings are analyzed, it is observed that the four dimensions of Finland's higher education policies in relation to the international perspective come to the fore: These are the policies that emphasize academic, economic, political and social reasons. In Turkey, the driving force in the context of policy-making towards the international dimension of higher education policy has been triggered by the inclusion of the Bologna process. Higher education in Turkey increasingly gets interested in international education policy during recent years and it is seen that they develop policies and strategies in higher education. It is observed that the regional strategies aimed at international student potential with Erasmus + Plus are followed, and universities included international strategies through CoHE. In addition, some initial recommendations were made for Turkish higher education in order to sustain sustainable development.

Abstract

Formal religious education is the name given to religious education and training in schools affiliated to the Ministry of National Education. Informal religious education in comparison covers religious education activities carried out by the Presidency of Religious Affairs in Turkey. In this study, the organizational commitment levels of teachers who have equal professional qualifications and personal rights are compared. The population of the study consists of 328 Religious Culture and Moral Knowledge, Imam Hatip High Schools Vocational Lessons and Qur'an Course teachers working in Istanbul in 2019. "Organizational Commitment Scale" developed by Ustuner was used as data collection tool. As a result of the research, it was revealed that the commitment of the teachers in both groups was found either higher or the same. However it was found that teachers working in two different institutions had different perceptions about participation in management.

Keywords: Lifelong Education, Informal Education, Organizational Commitment, Religious Education,

Introduction

1.1 Formal and Informal Education

When we look at the issue of education in terms of religious education, it is seen that religious education activities are carried out in the form of both formal and Informal education activities. Formal religious education in its shortest definition is the religious education and training activities given in schools affiliated to the Ministry of National Education. It covers a wide range of subjects from Religious Culture and Moral Knowledge lesson in all schools to vocational lessons in Imam Hatip High Schools and Faculties of Theology in higher education (MEB, 1991). Informal religious education generally includes religious education activities carried out by the Presidency of Religious Affairs. One of the most important of these educational activities is the Qur'an Courses, which have existed since the foundation of the Republic (DİB, 2010). The main element of the Informal religious education activities carried out by the Presidency of Religious Affairs through teachers having pedagogical formation in the field of religious education are the Qur'an Courses, the only educational center that provides education for students of all age groups. It is unique because there is no alternative Informal education allowed. These are especially Imam Hatip High Schools and Theology Faculties. However, the only institution that serves as an Informal religious education institution is the Qur'an Course (Ayдын, 2010). Formal and Informal education institutions are shown in Figure 1:

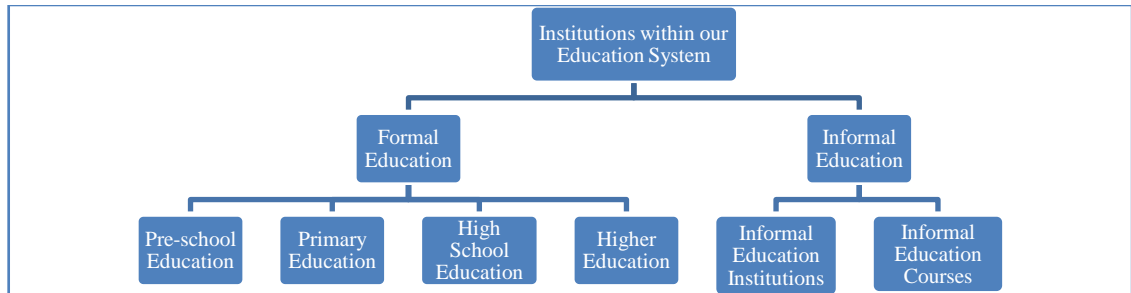

Figure 1: Institutions in Education System

1.2 Religious Education Teacher Groups

Religious Culture and Moral Knowledge and IHS Vocational Lessons Teachers working in schools affiliated with Ministry of National Education, and Qur'an Course teachers working in Qur'an Courses affiliated to Presidency of Religious Affairs are graduates of the same theology faculties and they have chosen this profession. On the one hand, they perform a profession with the status of a civil servant and on the other hand fulfill the responsibility adhered by religion.

The teachers who work in the Qur'an Courses are actually religious education teachers. In fact, it is a group of profession that should have different qualifications than the teachers of Religious Culture and Moral Knowledge and IHS Vocational Lessons in schools and whose task is relatively difficult and complicated (Aydın, 2010). Because Presidency of Religious Affairs, Qur'an Course teachers' qualifications gathered into three main groups: field competences, teaching-teaching competences and general cultural competences. In addition to the knowledge of the field, the teacher must also have the formation and knowledge of teaching in order to transfer the knowledge to the target audience. In addition to field and educational competencies, general knowledge of culture is necessary for a teacher, which enables students to relate their knowledge to their current lives (Öcal, 2001). Today, the most important factor for the Qur'an Course teacher to perform a different and perhaps more challenging task than the teachers of Religious Culture and Moral Knowledge and IHS Vocational Lessons in our schools is student profile. Students in schools are composed of significantly homogeneous groups in terms of their age and level of education. But in the Qur'an Courses, students from all ages, from pre-adolescence to adulthood, even to old age, participate in learning at all levels of education. In contrast to the homogeneity of the student group at school, there is quite heterogeneity in the Qur'an Courses. Providing education for people of different age and educational level presents many challenges in itself. This means that as a religious educator, the Qur'an Course teacher has to face more difficulties compared to the teachers of Religious Culture and Moral Knowledge and IHS Vocational Lessons in schools (Aydın, 2010).

1.3 Organizational Commitment

OC refers to the desire of employees to go to their workplace regularly, being at that workplace regularly, and integrating with that organization's objectives (Kell & Motowidlo, 2012), (Meyer, Stanley, Herscovitch, & Topolnytsky, 2002), (Hogan, Lambert, & Griffin, 2013), (Devece, Palacios-Marqués, & Pilar Alguacil, 2016). Effective communication and commitment between individuals builds a strong organizational culture (Parsons & Urbanski, 2012). High levels of OC may result in adopting the values and goals of the organization, exhibiting enthusiasm and utmost efforts in line with the organizational interests, and willingness to continue membership in the organization (Balay, 2000), (Biskin, 2014). Organizations have used different criteria and quality standards based on the efficiency of the processes with the purpose of guaranteeing the continuous improvement commitment and organizational commitment is just one of those (Salas-Rueda, 2018). Among the factors affecting OC, the intra-organizational factors play an important role in teachers' OC. Scholars note that while personal factors such as age, marital status, and gender tend to be effective in groups of employees with low-status jobs (Chih & Lin, 2009), intra-organizational factors such as management, leadership, organization type, organization culture, organizational justice, and teamwork are more effective in groups of employees with high-status jobs (Koç & Bastas, 2019). For the latter group, variables such as participating in decision-making processes, role ambiguity, and autonomy come to the fore as much more important factors in terms of commitment (Cohen, 1992). School principals paying more attention to cooperation and sharing and fair treatment to teachers increases teachers' sense of justice and equality (Bastas & Öztuğ, 2012) and are of great importance in terms of maintaining OC (Lambert, Minor, Wells, & Hogan, 2016), (Johnson, Hays, Center, & Daley, 2004).

1.4 Problem

In this study, administrators and teachers in formal and Informal religious education institutions;

1. Organizational commitment (OC) levels will be measured. Factors affecting OC positively or negatively will be identified.

2. The OC of teachers whose professional qualifications and personal rights are the same but the types of institutions they work with are different from each other will be compared. In this way, the different characteristics of the two different dimensions of education (formal / Informal) and their specific difficulties will be determined to what extent teachers have affected their OC.

The problem sentence of the research is as follows: What is the level of OC of teachers in formal and Informal religious education institutions? What are the individual and organizational factors affecting their OC?

Sub-problems of the research are:

1. Is there a difference between the OC levels of teachers in formal and Informal religious education institutions?
2. Do the OC levels of teachers in formal and Informal religious education change according to individual and organizational factors? Research subject;
 - a. According to the task type variable,
 - b. According to the age variable,
 - c. According to gender variable,
 - d. According to the educational status variable,
 - e. According to seniority variable,
3. How does the quality of their work affect the level of OC of teachers?
4. How does self-development affect the levels of OC of teachers?
5. How does organizational climate and culture affect the levels of OC of teachers?
6. How do human relations and communication affect the level of OC of teachers?
7. How does the sense of belonging and belonging to management affect the level of OC of teachers?
8. How does the sense of in-house justice and trust affect the level of OC of teachers?

Method

2.1 Method of the research

The research was conducted according to the quantitative research method. The type of comparison for the teachers in the research subject was determined through relational screening. The screening model is a research model that describes the past or present as it exists (Karasar, 2004). The research model used in our study is shown in Figure 2:

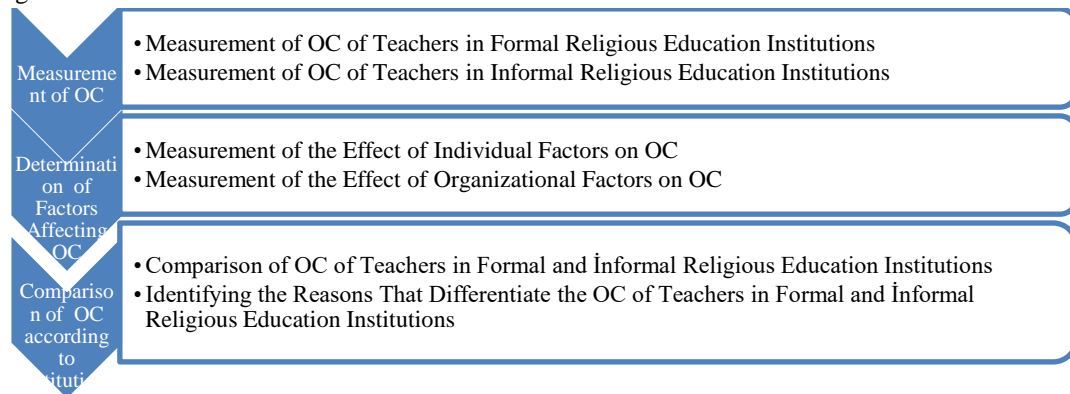

Figure 2: Research Model

2.2 Population-Sampling

The universe of the study consists of Religious Culture and Moral Knowledge and IHS Vocational Lessons Teachers and Qur'an Course Teachers who work in Kartal and Sancaktepe districts of Istanbul in 2018-2019 academic years. According to the information received from the National Education Directorates and Mufti Offices of both districts, this number is 463 in total.

The confidence interval was accepted as 0.01 and the margin of error as 0.05 in calculating the representation power of the sample group. As a result of the process, when the 1% confidence interval and 5% error margin are taken into consideration, the minimum number of samples that will represent the universe of 463 units of this study is calculated as 212 (Büyüköztürk, 2008).

According to this result, it can be said that the sample consisting of 328 units in the research is quite sufficient for the representation power of the study universe. Demographic characteristics of the participants in the quantitative dimension of the study are shown in Table 1:

Table 1. The Demographical Characteristics of the Participants in the Study

Variable	N	%	
Type of Institution	Formal Religious Education Institution	199	60,6
	Informal Religious Education Institution	129	39,4
Duty	Teacher	256	78
	Manager	72	22
Gender	Female	240	74
	Male	88	26
Education Status	Bachelor's	273	83
	Masters and PhD	55	17
Age	20-24	19	6
	25-29	50	15
	30-34	53	16
	35-39	69	21
	40-44	54	17
	45+	83	25
Duration Service in Institution	1-4	76	23
	5-9	107	33
	10-14	52	16
	15+	93	28
TOTAL	328	% 100	

2.3 Data Collection Tools

Literature was searched for the determination of data collection tools and related researches were examined. Ustuner's (2009) developed "OC Scale" is a scale consisting of 17 items and one dimension as a result of explanatory and confirmatory factor analysis. The internal consistency coefficient of the scale was .96 and the test-retest correlation coefficient was .88. These values have been accepted as proof that the scale can make a valid and reliable measurement in measuring teachers' OC level (Üstüner, 2009).

2.4 Reliability and Validity Of Data

The Cronbach's Alpha value of the 17-item OC scale was calculated as .95. This value indicates that the scale is a highly reliable scale. When the factor analysis was performed, the only factor containing the whole scale was found.

2.5 Analysis Techniques

SPSS 25.0 program was used for statistical analysis. Arithmetic means were obtained in the measurement of teachers' OCs. Since the 5-point Likert Scale used in the scales is an evaluation scale from 1 to 5, the score range corresponding to each option was determined by dividing it into five equal parts. Here, when rating applies, the lowest score to be obtained from 17 items would be 17 and the highest score would be 85. The highest score implies higher OC and the lowest score implies lower OC (Üstüner, 2009).

In this study, statistical methods compatible with every sub problems were used. First of all, reliability analysis was conducted and then Cronbach Alpha internal consistency coefficient was calculated. For demographic factors with 2 groups, t-test was applied. Also, intragroup differences were observed. Levene test, Anova test, Tukey HSD, Brown-Forsyth and Tamhane T2 test were applied in later stages.

In order to determine teachers' OC, weighted mean and standard deviation values of the answers were calculated within the context of items and dimensions.

Findings

The first item of our research is to determine whether there is a difference in OC levels of teachers in formal and Informal religious education institutions. The data showing this is given in Table 2:

Table 2. Organizational Commitment Levels of Teachers

Type of Institutions	Number of Participants	Arithmetic Mean	Standard Deviation	Level of Commitment
Formal Religious Education Institution	199	4,12	0,90	High Level
Informal Religious Education Institution	129	4,12	1,03	High Level

According to the results of the study, it was found that teachers in formal religious education and teachers in Informal religious education felt highly dependent on their institutions with the same score ($\chi=4,12$). Although the same score value had a high level of commitment in teacher groups, their responses to the 1st, 3rd and 15th items in the scale differed significantly from each other. These results are given in Table 3:

Table 3. The items that were found to be different between two groups in Organizational Commitment Scale

Question Code	Increases my organizational commitment	Teachers in Formal Religious Education Institution	Teachers in Informal Religious Education Institution
1	Me being included in planning, organizational and executive works in my school / course.	4,06	4,29
3	Me being a part of the management in this school	3,79	4,07
15	As my superiors appreciate my work	4,15	3,79

When the results in Table 3 are examined, the commitment levels of teachers in formal religious education institutions are lower than those in Informal religious education institutions, especially in terms of participation in management. As one of the reasons for this result, it can be said that the decision-making mechanism is more open to consultation since some of the Informal religious education institutions are composed of a single administrative teacher and some of them consist of a staff consisting of less teachers. However, teachers in Informal religious education think that they are significantly less appreciated than their counterparts in formal religious education.

When the OC levels of the teachers were compared according to their role as administrators or teachers in their institutions, no significant difference was observed between teachers and administrators in Informal religious education institutions. However, administrators in institutions providing formal religious education gave higher scores to all items of the scale, which would make a significant difference compared to teachers. These results are given in Figure 3:

Figure 3: Commitment Levels of Teachers According to Duty Types

According to the results in Figure 3, administrators in schools affiliated to Ministry of National Education are the groups with the highest level of commitment among the groups ($\chi=4.59$). There is a significant difference when compared with the commitment levels of teachers in schools. As a result of this, the item with the highest score answered by the administrators in the schools I can work in this school outside of class hours without considering any monetary gain was the 12th question. The change in the type of duty between the administrators and teachers in the Qur'an Courses has no effect on the commitment. Both groups have a high level of commitment.

When the OC levels of the teachers were evaluated according to their gender, 99% of the participants in the Informal religious education parts of the study were women, as the Qur'an Courses were generally made up of women by their nature. For this reason, it was not possible to evaluate the commitment levels of the teachers in the Qur'an Courses in terms of male and female. However, teachers and administrators in schools have a more heterogeneous distribution and 43% of the participants in the formal religious education part of the research were women and 57% were men. When the OC of teachers in schools was evaluated according to gender variable, it was found that there was a significant difference between men and women in articles 4 and 11. The results showing this are given in Table 4

Table 4. Gender Variables Significantly Affecting Teachers' Organizational Commitment in Schools Connected to of National Education

Question Code	Increases my organizational commitment	Male Teachers	Female Teachers
4	My desire to overcome difficulties I face within the school	4,03	3,73
11	I feel I am a part of the management	3,98	3,58

Male teachers have a higher level of commitment than female teachers in terms of overcoming difficulties in school and participating in management. Male teachers in Ministry of National Education schools generally have a high level of OC, while female teachers have a moderate level of commitment in general. Almost all of the Qur'an Course teachers who participated in the study were female teachers and their commitment levels were found to be ($\chi=4.12$). The commitment levels of female teachers in the schools were found to be ($\chi=3.93$) and it was found to be lower than the female colleagues working in the Qur'an Courses.

When the OC levels of teachers (in terms of undergraduate and graduate-doctorate graduation) were compared according to their educational status, it was found that there was no significant difference on the OC of teachers in both formal and Informal religious education institutions. Accordingly, it can be stated that the educational status has no effect on the OC of religious education teachers.

When the OC levels of the teachers were analyzed according to the age variable, it was found that there were significant differences between both institutions and age groups. The results showing this are given in Figure 4:

Figure 4: Comparison of Teachers' Organizational Commitment Levels According to Age Variable

As can be seen in Figure 4, when the commitment levels of teachers are evaluated according to age variable, similarities and differences occur between the institutions. Teachers in both institutions feel the lowest level of commitment in the 30-34 age range. In both institutions, a high level of commitment is observed in the first 5 years of the teachers' employment, followed by a decrease in the level of commitment. Both types of institutions also differ from each other. Although the highest commitment ($\chi=4.21$) of teachers in Ministry of National Education -affiliated schools was observed in the 35-39 age range, the highest commitment ($\chi=4.38$) of teachers in the Qur'an Courses was observed in the age group 45 and over.

When the relationship between teachers' OC and working time in their institutions was examined, it was found that there was no significant difference on the OC of teachers in both formal and Informal religious education institutions. According to this, although age variable is an important factor on the OC of religious education

teachers, it can be stated that the duration of service in the institution has no effect on the OC of religious education teachers.

In order to examine the effect of the character of their work on the OC levels of the teachers, the answers given to the 4th item in the scale were evaluated. The results are shown in Table 5:

Table 5. The Effect Of The Character Of Their Work On The Organizational Commitment Levels Of The Teachers

Question Code	Increases my organizational commitment	Teachers in Formal Religious Education Institution	Teachers in Informal Religious Education Institution
4	My desire to overcome difficulties I face within the school / course	3,93	3,97

It is seen that the difficulties arising from the institutions they work and the work they have have almost the same effect on the teachers who provide formal and Informal religious education. Both groups have a high level of commitment to their institutions despite the specific challenges of their work.

In order to examine the relationship between self-development opportunities and teachers' OC levels, responses to the 5th item of the scale were evaluated. The results are shown in Table 6:

Table 6. The Effect of Vocational Development Opportunities on Teachers' Organizational Commitment Levels

Question Code	Increases my organizational commitment	Teachers in Formal Religious Education Institution	Teachers in Informal Religious Education Institution
5	As there are vocational development opportunities in this school / course	3,89	3,92

It is seen that teachers who provide formal and Informal religious education have almost the same perception about the existence of professional development opportunities in the institutions they work for. Both groups think that their institutions offer high level of professional development opportunities. It can be said that teachers who have the opportunity to develop themselves in their institutions have experienced a high level of commitment.

In order to examine the relationship between organizational climate and culture and OC levels of teachers, responses to items 7th and 16th of the scale were evaluated. The results are shown in Table 7:

Table 7. The Effect of Organizational Climate and Culture on Teachers' Organizational Commitment Levels

Question Code	Increases my organizational commitment	Teachers in Formal Religious Education Institution	Teachers in Informal Religious Education Institution
7	As my school / course embraces a stable and development-oriented structure	4,29	4,17
16	The balance between freedom and responsibility prevailing in my school / course	4,11	4,09

When the perceptions of teachers about the organizational climate and culture in the institutions they work with are compared, it is seen that the values given by the religious education teachers in the schools are very high ($\chi=4.29$) and the teachers in the courses have high levels of ($\chi=4.17$).

The answers to the 15th and 17th items of the scale were evaluated in order to examine the relationship between human relations and communication and teachers' OC levels. The results are shown in Table 8:

Table 8. The Effects of Human Relations and Communication on Teachers' Organizational Commitment Levels

Question Code	Increases my organizational commitment	Teachers in Formal Religious Education Institution	Teachers in Informal Religious Education Institution
15	As my superiors appreciate my work	4,15	3,79
17	Because I think I am paid attention to and taken into consideration	4,16	4,23

Teachers in Ministry of National Education schools feel that they are both taken into account and appreciated by their administrators. However, the teachers at the Qur'an Courses think that even though they feel that they are being taken into consideration by their administrators, they are not appreciated by their superiors for the correct

work they have done. This item is one of the lowest value among the answers given by Informal religious teachers ($\chi=3,79$).

The answers to the items 1, 3, 11 and 14 in the scale were evaluated in order to examine the relationship between the level of participation and belonging to the administration and the OC levels of the teachers. The results are shown in Table 9:

Table 9. The Effect of Participation and Belonging to Management on Teachers' Organizational Commitment Levels

Question Code	Increases my organizational commitment	Teachers in Formal Religious Education Institution	Teachers in Informal Religious Education Institution
1	Me being included in planning, organizational and executive works in my school / course.	4,06	4,29
3	Me being a part of the management in this school	3,79	4,07
11	I feel I am a part of the management	3,85	3,74
14	As our managers encourage us to collaborate when they make decisions and solve problems	4,18	4,04

Teachers providing both formal and Informal religious education answered the 11th question (being part of the administration) with the lowest score ($\chi=3.74$) among the 17 items on the OC scale. In general, it can be said that teachers do not feel themselves as a part of management.

In order to examine the relationship between internal justice and trust and OC levels of teachers, responses to items 2, 10 and 13 of the scale were evaluated. The results are shown in Table 10:

Table 10. The Effect of Internal Justice and Trust Sense on Teachers' Organizational Commitment Levels

Question Code	Increases my organizational commitment	Teachers in Formal Religious Education Institution	Teachers in Informal Religious Education Institution
2	Because of the high level of trust prevailing in my school / course	4,16	4,26
10	Because of its just and considerate management	4,30	4,23
13	As performance is rated objectively rather than considering the performer	4,20	4,21

According to these results, it can be said that teachers experience a high level of trust and justice in their institutions. The value of the answers given by the participants to all three questions is almost the same. Formal and Informal religious teachers seem to have a high level of OC due to their sense of justice and trust.

Results, Conclusions and Recommendations

As a result of this study comparing the teachers working in formal religious education and the teachers working in Informal religious education, it was found that the commitment of the teachers in both groups was high and the same ($\chi=4,12$). However, when the teachers working in two different institutions were examined individually on the basis of the items on the scale of OC, it was found that there was a significant difference in two dimensions. In terms of participation in the administration, it was observed that the OC of the teachers working in Informal religious education was very high ($\chi=4.29$). In terms of being appreciated by their superiors, OC ($\chi=4.15$) of the teachers working in formal religious education was higher than the other group ($\chi=3.79$).

When the findings on the effects of demographic characteristics on teachers' OC were examined, it was seen that duty type, gender and age variables were the factors that caused significant differences between teacher groups.

In terms of duty type, it was determined that the administrators in the schools providing formal religious education had a higher commitment in all items of the scale than the teachers. However, there was no difference between administrators and teachers in Informal religious education courses.

In terms of gender factor, male teachers in formal religious education show higher levels of commitment in terms of overcoming difficulties in school and participation in management than female teachers. Since the majority of the teachers in Informal religious education courses were female teachers, there was no opportunity for a healthy assessment within them.

When the age factor is considered, the commitment of teachers in both formal and Informal religious institutions follows a fluctuating course according to the age variable. The commitment levels of the teachers, who experienced a high commitment in the first years of their duties, then decreased. Then it started to rise again between the ages of 30-40. The difference between formal and Informal religious teachers is seen in the 40 and over age group. While the commitment level of teachers in Ministry of National Education -affiliated schools has declined again after the age of 40, the commitment levels of teachers in Qur'an Courses continue to increase. It was observed that the educational status and seniority variables did not make a significant difference on the commitment of the teachers in both formal and Informal education institutions.

Teachers in formal and Informal religious education institutions have the same level of qualifications of their work and their unique difficulties and their perceptions of the existence of professional development opportunities in their institutions, and they are of the same level and high quality. There are similar findings in the literature. Vocational development opportunities are the most important factor that connects teachers to school (Koç & Bastas, 2019). Besides teachers in both groups experience a sense of satisfaction arising from reputation's despite the difficulties of their work.

It can be said that teachers who provide both formal and Informal religious education do not feel themselves as part of the administration. They gave lower points to the articles related to participation in management than other items. In addition, teachers in Informal religious education courses feel that they are not appreciated by their superiors.

It can be said that teachers who provide both formal and Informal religious education experience a high level of trust and fairness towards their institutions.

Due to the nature of Informal education, the work of the teachers has its own difficulties. Because of students from all age groups participate in training at Qur'an Courses. In order to improve the quality of the education provided in the courses and to minimize the difficulties that the teachers may face, courses such as communication, social psychology, public relations and old age psychology can be included in the curriculum of the Faculties of Theology. In addition, various applications can be put in place to enable students to learn through this curriculum.

In the last year of the Faculty of Theology, prospective teachers go to schools as interns. Considering the fact that some of these students continue their professional lives as teachers of the Qur'an Courses in Presidency of Religious Affairs and that the school and course environment and student profiles are very different from each other, it can be considered that the Presidency of Religious Affairs should be included in the internship program. The possibilities of professional development, which are found to be among the factors that ensure high level of commitment of the teachers in religious education institutions, can be increased.

To correct teachers' perceptions of not being appreciated by their superiors, administrators can use an effective reward system for teachers' efforts and sacrifices.

One of the important factors that decrease the high level of commitment of teachers is their thoughts about not being able to participate in management, planning and decisions. It can be stated that the improvements of the institution at this point and the formation of a more democratic management structure will positively reflect the loyalty of the employees.

It would be appropriate for researchers to conduct both theoretical studies and field studies on the Qur'an Course teachers.

As a Informal education institution, researches and studies can be carried out on topics such as the curricula, materials and teaching methods and techniques of the Qur'an Course that have their own characteristics and difficulties.

Since the Qur'an Courses have different structural and managerial characteristics than formal education schools, researchers in educational administration can work on Informal education institutions to present due diligence and new model suggestions.

Abstract

The article researches the development mechanisms of using the e-management system by teachers in the example of the University of Economy, one of the leading universities of Azerbaijan. Application of a Learning Management System (LMS) in Azerbaijan State University of Economy and teachers' methodology of using lectures placed in LMS have been analyzed. Statistic data on uploading lectures to LMS system reveal that teachers' interest has been increased to the system. The problems related this system are also examined further, and some proposals have been put forward about the ways on how to solve the problems, the transition from traditional publication to e-publication, open education system, implementation pilot projects and the means to provide comfort and employment of students and teachers at the university. The article assesses strategically circumstances formed by external factors in order to check the impact on low usage of e-resources by teachers at the university. The primary purpose is to find the ways on how to increase the utilization of LMS system by teachers and give recommendations to them about it. The article also deals with one of the important requirements - the processes in the direction of nationalizing programs used in the e-management system.

Key words: e-management system, e-resource, e-lecture, interactive training, higher education, social reading.

Introduction

Azerbaijan has prioritized the establishment of the Azerbaijan Information Society as the main priority of state policy. Doing so will include structuring a single national electronic information space, the introduction of e-management systems in the higher education system, improving the use of electronic resources, identifying the ways to provide teachers and students with employment and comfort, and implementing different social reading programs apart from traditional lectures in classrooms while providing for information security and the elimination of electron retention¹.

The tendency of the society to embrace global informatization depends directly on the development of educational institutions. This requires the creation of an uninterrupted educational system that ensures that everyone will have access to a high-quality fundamental education according to each person's desires and needs that is available anywhere and anytime. For this reason, the introduction of electronic education related technology is essential to establishing such an education system.

E-training technology provides the most effective tools for directing people to new types of education and to

¹ See link: Innovations in Education and Teaching International. 2018;55
online: <https://srhe.tandfonline.com/doi/abs/10.1080/14703297.2018.1546608#.XV-yVvkzYps>

developing the skills and abilities needed for lifelong learning. E-education creates enormous opportunities for lifelong learning by building a bridge between labour and education. E-education is the bridge between labour activity and education today. In return, it makes broad opportunities for education along the life.

Method

Nowadays, much progress has been made on improving the internet resources of Azerbaijan. This has increased the interest of pedagogical staff in using the internet as an education tool in both secondary and high schools. Higher educational institutes of Azerbaijan have been provided with computers and internet services. Ongoing analysis shows that these are being used efficiently for various types of courses.

1. Current situation

Today, teachers enthusiastically prepare lessons using e-resources in the e-management system. The ways in which teachers communicate has undoubtedly changed recently. Many teachers now use public networking that is conducted on Facebook and Twitter in the place of face-to-face dialogue, and phone conversations. There is no real difference between these types of communication. For example, smart phones have become an integral part of student life that allows student to rapidly communicate with their friends and family. "State Strategy under Development of Education in the Republic of Azerbaijan" was approved by an order dated October 24, 2013 of the President of the Republic of Azerbaijan². It says: "The role of education in the economy has significantly increased in modern life. Education must not only serve to teach required skills and knowledge related to economics but must also serve to prepare citizens for their future life and integration into society comprehensively.

The most important role of education in economic life is to meet the educational requirements needed for the lives of human beings. Meanwhile, rapid innovations regularly require knowledge and skills to be refreshed. For this reason, skills and knowledge are required in order to master new smart technologies and relevant professions. Education plays an important role in the development of a knowledge-based economy.

Today's information knowledge society creates a great opportunity to socialize individual knowledge via the internet environment. Azerbaijan has implemented many reforms in this direction. For this purpose, two documents have been approved namely the "Azerbaijan 2020: Look into the Future" Development Concept approved on December 29, 2012, by an order of the President of Azerbaijan² and "Strategic Road Maps for the Perspectives of the National Economy" approved on December 6, 2016 by the Republic of Azerbaijan³.

These state programs support the related sectors of the knowledge economy such as high quality education, effective fundamental science, knowledge production, high-end technologies, effective science such as technical venture business as well as the realization and transfer infrastructure of ideas. E-learning has been reflected by a number of documents approved for the development of the national educational system in Azerbaijan. Thus, the Law of the Republic of Azerbaijan No.833-IIIQ dated June 19, 2009 was approved.

Azerbaijan hosts more than 1 million internet users. Including 12% of the population with a gender based breakdown of 69.9% male and 30.1% women. Those internet network users are grouped as follows: 36.4% at home, 23.0% in internet clubs, 19.8% at work, 14.9% at educational institutes, 2.1% in libraries, and 3.8% in other places⁴.

² See link: State Strategy under Development of Education in the Republic of Azerbaijan 2013, <https://edu.gov.az/en/page/473>

³ "Azerbaijan 2020: Look into the Future" Development Concept approved on December 29, 2012, by an order of the President of Azerbaijan, https://president.az/files/future_en.pdf

⁴ On some problems of the creation and development of green technologies in Azerbaijan

E-training processes are complex at the higher educational institutions of Azerbaijan.

- Development of methodological and normative base on Learning Management System (LMS) is in low level.
- Uncertainty of assessment criteria for the evaluation of e-training tools makes e-training realization processes complex.
- It is needed to achieve new goals by identifying critical features on LMS lectures between teacher and students.
- Teachers prefer to deliver lectures to students through e-system. However, the quality of lectures is not guaranteed

Existing problems have been analyzed during the research activity, and some proposals have been put forward to eliminate such problems.

2. Analysis of eduman training management system

We can set the research at Azerbaijan State University of Economics as an example. It has already been started to apply “e-university” model in the university. At the initial phase, the whole educational processes were fully electronized in the main building.

The system encircles students, teachers, information about alumni, lesson schedules, subject groups, calendar-thematic plans of subjects, and individual educational programs of students. Personal cabinets have been created for teachers and students. Electronic stands have been installed with an access to the system in the auditoriums. An electronic journal has replaced the paper journal. EDUMAN with national interface system has been practicing since 2015.

Not only students may be assessed but also teacher will be evaluated via this system. Thus, official assessment of teachers has been implemented since 2015 - 2016 academic year with a purpose of transition to differential salary.

The functions of EDUMAN training management system are the following:

- Obtain its reports automatically in multi-categories;
- Practice of "drag & drop" methodology of lesson schedules;
- Online accessibility of training materials to students by video, audio or different formats;
- Organize social network forums on hierarchical systems among university contingents;
- Upload lectures to teacher’s cabinet in different formats;
- Conduct e-exams;

Organize written exam sheets without human intervention via barcode reading system and other innovative features;

The interactive software program is formed on Oracle/Java technologies and has more than 40 modules.

EDUMAN with national interface system has report and control mechanism on the success of students for mastering specific topics, the relevance of training to preliminary purposes, the practical application of the knowledge gained, and the effectiveness of the training. The most important elements of the system are the report on teaching processes. We can infer that investment on e training is effective.

3. Statistical indicators on uploading lectures to eduman system

According to our observations, statistical indicators on uploading lectures to EDUMAN system of departments increased significantly in the 2016-2017 academic year in the Azerbaijan State University of Economics. Thus, every teacher has uploaded his or her lectures on subjects per semester. We can also observe from the graph that electron activity of teachers has increased from time to time. It means there is enough progress on the 2015-2016

academic year. Now, let's have a look at the comparison analyzes on uploading lectures to system by departments comparing 2015-2016 to 2016-2017 academic years:

Table 1. Comparison of uploaded lectures to a Learning Management System by department

№	Department	Subject	Lecture 2015–2016	Lecture 2016–2017
1	Business management	35	46%	58%
2	The Azerbaijani language	19	68%	98%
3	Trade and customs management	81	59%	59%
4	Marketing	49	67%	68%
5	Humanitarian subjects	59	91%	68%
6	Management	67	70%	71%
7	Econometrics	22	68%	45%
8	Maths	52	56%	51%
9	Civil defense	15	80%	80%
10	International economics (English)	62	38%	45%
11	Examination of consumer goods	88	25%	19%
12	Standardization and certification	34	55%	49%
13	International economic relations	38	34%	38%
14	International relations	30	86%	87%
15	Economic theory	32	78%	76%
16	International economics	35	48%	43%
17	Regulation of the economy	47	36%	69%
18	Industry economy	46	69%	66%
19	Administration and economy of labor	36	56%	57%
20	Price and price formation	26	73%	69%
21	Economy and management of social fields	33	75%	73%
22	Economic law	36	72%	70%
23	Economy and protection of environment	67	62%	67%
24	Technology of catering products	67	47%	35%
25	Informatics	49	61%	67%
26	ICT and information economics	45	71%	69%
27	Design	30	53%	37%
28	Physics and chemistry	42	50%	34%
29	Technological machines and field equipments	80	53%	47%
30	Finance and financial institution	104	68%	67%
31	Statistics	28	78%	78%
32	Theoretical and practical economy	46	86%	86%
33	Foreign languages	89	6%	37%

35	The Russian language	34	2%	54%
36	Economics and management	69	7%	9%
Total:		1804	2043	2122

Figure 1 - A comparative analysis of the percentage of e-lectures available in 2016 and 2017

According to our research on 37 departments, we have seen that they used MS Excel software to build regression

equations for comparative analysis⁵. In our example, the linear regression equation will be shown as follows:

$$Y_j = ax + b \quad (1)$$

Here a is a regression. Thus, the linear regression is a sign of inclination. In our version, a shows a 2016-2017 academic year, and the coefficient b indicates the 2015-2016 academic year. Comparative analysis of departments is conducted for these years. Here j shows the number of observations on departments. In our version, j will equal to 37. Let's calculate with this formula:

$$R^2 = \frac{\sum(y_i^j - \bar{y})^2}{\sum(y_i - \bar{y})^2} \quad (2)$$

Having calculated in MS Excel, we got R determinate coefficient: $R^2 = 0,6583$ (3)

It shows the degree of conformity between the input and regression model. The linear regression equation is set for the following indicators:

$$Y = 0,05 * X + 0,86 \quad (4)$$

This is Darbin-Watson coefficient:

$$DW = 1,97 \quad (5)$$

Apparently, Darbin-Watson ratio is smaller than 2, and it means that autocorrelation is adequate for the indicators that are the parts of the equation. The Azerbaijan State University of Economics has achieved great success for continuous improvement of the national e-management system in 2017. Some important issues like registration of student and teaching staff, its management, uploading of the subject, lesson plans, lecture, presentations, interactive works, video-trainings as well as conducting student assessments and surveys, and setting exams are organized electronically by the system.

Students, as well as parents, can access the above-mentioned e-management system with individual ID numbers and passwords at any time and any place and get relevant information on a mobile basis. Integration of the system into the e-library of the university is organized.

The main goal here is to introduce innovative technologies to create a transparent and effective educational environment, improve the quality of education, and raise university management to the level of modern requirements.

We assume that as a result of the introduction of e-management systems in the university all stages of education will be informatized, transparency will be fully satisfied, and the quality of teaching will increase. We can set an example the results of the research for student's knowledge assessment done by the Azerbaijan State University of Economics through the e-management system.

University students can sit an exam by getting materials on every subject entering to student cabinet of system in Azerbaijani language called EDUMAN via a previously provided login and password in summer and winter sessions. Teachers prefer to deliver lectures to students through e-system. However, the quality of lectures is not guaranteed. Social reading initiatives aren't preferred during lectures in the auditoriums. Besides, e-books aren't used. However, trainers who participate in collaboration with students can form a productive environment of

⁵ Model evaluation of an Innovative Capital, OCT 12-14, 2016, 607-609. Web of Science
<https://ieeexplore.ieee.org/document/7991775>

social reading initiative for active learning. E-reading platform that enables social reading is not used. According to our researches, there is no any requirement to prepare lectures. It is one of the main problems⁶.

Lets use PEST analysis or macro environment analysis to find out the causes of the problem. PEST – is the political, economical, social (including legal and cultural) and technological environment. It is known that political changes in one sphere create economical changes in another sphere and in general, the changes in the economy can accelerate political activities and changes in its turn.

Table 2. Political, Economic, Social (including legal and cultural) and Technological environment analysis

Political	PEST analysis	
Factor	Impact on educational institutes	Planned measure
University does not provide teachers with free internet.	Teachers doesn't work on themselves	1.Teachers will be trained to use emails. 2.Conducts the EDUMAN trainings
Economic		
IT department closes	Reduction of budget	Testing teachers
Social		
Raising salaries	Preparation for distance lessons	Relevant salary
Technological		
Webcam, join to network, social network and online students-teachers	Demand for web-trainers for workshop in online social student groups	Electron Warehouse for Training materials, a new website for students and teachers for using the Open Source Web 3.0 interactivity.

We have to look through all factors in Table 1 - PEST analysis and explain its influence on the activity of high institutions by choosing the most important ones between them. Afterwards, we must mention the factor that has the most positive and negative impact on the macro environment of the university. Strategic environment is assessed which affects the low level of using e-resources of university teachers.

Results, Conclusions and Recommendations

The application of Internet resources and technologies in the educational system will enable people to increase their knowledge and skills by using internet resources and social services not making any payment or leaving their places⁷.

The PRT colloquium (mini-conference) program at the Sidney University of Australia was implemented at STEM departments. Teachers exchanged their experiences with colleagues at the university. Observations were conducted by pedagogical and disciplinary experts.

It would be better to apply practices acquired by PRT program in the Azerbaijan State University of Economics. In the course of the research, the following proposals were put forward about the existing situation based on the analysis and assessment:

- 1) It is necessary to develop the Learning Management System methodological and normative base.
- 2) It is necessary to determine an assessment criterion for the evaluation of e-training tools.
- 3) The rules for preparing lectures for electron environment at the universities must be developed and approved by the authority. Besides, there is a demand to evaluate teachers by students for their lectures. It means that teachers might be assessed for the percentage of students how they understand the lectures. The selection of a

teacher in the system can be implemented according to the percentage of students' acquisition. Under these conditions, the issue of improving the quality of lectures can be solved.

4) Information technology department, librarians and training designers of every university should lead to social reading initiatives not asking a charge for membership fees from teachers, students, and staff. So, some parts of the students and teachers' needs can best be solved by this way⁷.

5) It is recommended to prefer open education resources at universities and implement a pilot project in this direction.

6) It is possible to achieve new goals by identifying critical features on LMS lectures between teacher and students.

7) It is needed to define if there is any requirement to prepare lectures.

Abstract

The personality of a teacher and his or her relationship to students has been a much-debated issue. The influence of a quality relationship between the teacher and the student during the complete educational process is beyond question. The presented article reflects on the ethical aspects of the teacher-student relationship. The study group included 127 students (practising or future teachers) of the Department of Education. Using the reminiscence method, the participants were asked to describe a situation when they felt somewhat harmed by a teacher. The research was designed as a concurrent immersed (grounded) strategy. The data was collected concurrently in terms of the qualitative and quantitative approach, however, the data acquired by one method are dominant in the research analysis (Cresswell, 2003). In our case, the qualitative data were the dominant data (acquired by in-depth analysis of the students' statements); the quantitative data (frequency) had more of an additional and enriching character. Our qualitative analytical work with data was based on procedures analogous to open axial coding within the Grounded Theory (Strauss, Corbin, 1999; Hendl, 2016). The students' ruminations pointed out examples of a pathogenic teacher-student relation, contradictory to ethical principles. Some reminiscences even related to the period of preschool development.

1 Introduction

There are many studies, both Czech and foreign, that deal with the issue of teacher-student communication and mutual relation (e.g. Mareš, Křivohlavý, 1995; Rogers, Freiberg, 1998; Hamre, Pianta, 2001; Meehan, Hughes, Cavell, 2003; Lee, 2012; Gillernová, Krejčová et al. 2012; Plevová, Badošek, Kimplová, 2016; Vacek, 2017 etc.). The main reason for this interest is the explanation force of this topic in understanding phenomena in the educational reality of the school environment. The pedagogical interaction is analysed from a point of view of many branches of science, including psychology. It is often emphasised that there are many factors in the interaction that create quite complicated structures and affect not only the influence teachers have on students, but also interactions between the students. Pedagogical communication with precisely defined time and spatial terms and conditions, a defined objective, content and rules of contact between the teacher and students is an important tool of pedagogical interaction. Through pedagogical communication, we not only provide information, but also attitudes, emotional relations or rules (Vališová et al., 2011). The teacher should educate and also cultivate the emotional aspect of the student's personality, his moral thinking and reasoning, ethical attitudes and values. It is the issue of values that was the centre of interest of humanistic psychology, the paradigms of which were also reflected in the field of education. The issue of humanisation of education was highly relevant in the USA in 1970s when Rogers published his first book (Rogers, Freiberg, 1969, 1998), in which the representative of humanistic psychology formulated, among others, his idea of the necessity to make the process of education more humane. From that perspective, a healthy relationship between the teacher and the student is based on *four basic requirements for the teacher's attitude towards the student* (Rogers, Freiberg, 1998; Rogers, 1994).

The first requirements is that the teacher be open, honest and true to the student (the requirement of congruence). Congruence is defined as harmony between experience and behaviour. Sometimes, transparency is referred as well. It is authenticity including the necessary tact and thoughtfulness.

The second requirement is that the teacher is capable of empathetic understanding (the requirement of empathy). It is an ability to be tactfully interested in how the student experiences the whole process of learning and the situation at school, which is the basis for understanding what is behind the student's behaviour. A genuine interest in the feelings of the others creates conditions for mutual liking (fondness) and thus the potential willingness to act in favour of the other (altruism). It is not for nothing that some authors consider empathy to be the cornerstone of moral development (e.g. Coles, 1998; Cain, Carnellor, 2008).

The third requirement is that the teacher approaches the student with kindness and respect of who the student is (the requirement of unconditional positive acceptance). Respect and reverence are based on acceptance of the student's personality as a value. It is the basic respect and reverence for the student, his feelings, opinions and behaviour.

The fourth requirement is that the teacher is consistent in her manifestations (the requirement of consistency). It means that the attitudes are not a mere teaching tool or method, but an integral part of her personality, an integral part of her educational ideology. It guarantees that her behaviour will be stable, consistent and unambiguous in spite of some situational variability. The purpose of this approach is to create an environment of "psychological safety" or mutual trust at school, where the student can move without worries and without any blocking defences (Rogers, Freiberg, 1998).

The quality of the relationship of the student with his environment has an immediate effect on forming his self-image as an important component of his global self-system. It is known that when the student's self-system is jeopardised, it can have a malformation effect on self-experiencing, and thus on healthy personality development (Kusák, 1991). Moreover, stressful interpersonal relations in a school environment may not only influence the student's overall resilience to school stressors, but also his general feeling of physical and mental fitness. The more the stressor jeopardises the student's self-esteem, the more difficult it becomes. The impossibility of forming healthy self-esteem of the student in the school environment creates conditions for deficit moral aspects of his self-fulfilment and personality growth. Therefore, the environment and the formation of suitable social terms and conditions for moral behaviour has a great influence on the healthy development of the student's moral judgement (Vališová et al., 2011; Mareš, 2013).

It turns out that the topic of teacher-student relations is the centre of interest of studies in relation to various variables. Despite this fact, there are still areas that we consider meaningful to map. One of them is to examine the teacher-student relation from the point of potential psychogenic damage to the student by the teacher. Psychogenic damage of a client due to an unprofessional approach is known in the medical sphere as iatropathogenesis (Honzák, 1999; Mareš, 2002). Terminology in the field of education has not been clarified, however, the experience shows that psychogenic damage of students due to the inappropriate approach of the teacher in a school environment does occur. It means that in some cases, the teacher's approach towards her student may be called pedagogically pathogenic. In this context, we were interested in how our participants remember their teachers, whether or not they experienced anything negative during their contact with teachers at school, and whether or not they felt that the teacher emotionally affected or harmed them with her behaviour and approach.

2 Problem Statement

The quality of the teacher-student relationship may substantially facilitate the fulfilment of educational objectives (a facilitating effect) or on the contrary, it can make the fulfilment more difficult (an inhibiting effect). The teacher-student relationship is thus justly considered to be one of the most important non-cognitive conditions determining the effectiveness of the teacher's educational effect. The objective of our study was to analyse any potential reminiscences of the participant's negative experience in the teacher-student relationship.

3 Research Questions

- 1) Have the students in our group ever experienced a situation when they felt harmed by the teacher's inappropriate approach?
- 2) If yes, what is the content of the reminiscences?

4 Research Methods, Research Sample

The research data were obtained in the form of a free written statement of the participants where each had the opportunity to express their comments to the observed topic using the reminiscence method. The reminiscence method is often used, for example, in seniors and it is based on recollecting memories of the experienced events in their lives (Janečková, Vacková, 2010; Špatenková, Bolonská, 2011).

The participants answered the following question: Have you ever experienced a situation when you felt harmed by the teacher's approach (and you still perceive it that way)?

The research was designed as a *concurrent immersed (grounded) strategy*. The data were collected concurrently in terms of the qualitative and quantitative approach, but in our case we considered the qualitative data (acquired by in-depth analysis of the written statements) to be dominant in the analysis. The obtained quantitative data (frequency) had a supplementing and enriching character within this type of examination (Cresswell, 2003). The qualitative analytical work with data was based on procedures analogical to open axial coding in the grounded theory (Strauss, Corbin, 1999).

The data were collected during 2018. The research group included students in the educational fields of study at the Palacky University's Faculty of Education in Olomouc, both full-time and distance learning. Out of the total sample of 127 participants, 123 participants answered the research question (97%). There were 81 women (66%) and 42 men (34%). The youngest participant was 20 years old and the oldest was 37 years old.

5 Findings

The analysis is based on the statements of 123 participants (current and future teachers) who provided their statements of a negative personal experience in the teacher-student relationship using the reminiscence method, covering the entire period of their school attendance.

5. 1 Analysis of the areas of reminiscences of psychogenic harm of the student by the teacher determination of basic categories

The analysis of the free statements of the participants showed that all reminiscences have one aspect in common. The pathogenic reality expressing devaluation of the student's self-esteem by the teacher was described in all cases.

The subsequent coding showed that the free statements concerning the devaluation of the student's self-esteem related to five basic categories: *personality, appearance and physical properties, disregard of performance, addressing the student, and subject of study – education*, unclassified statements¹ (Graph 1).

¹The results of the analysis are organised in a system from the most general level of the area of study through the category levels to the most specific subcategories. Authentic statements of the participants are indicated by quotation marks in the text and they are written in cursive

Graph 1 List of categories of the psychogenic harm of the student by the teacher (devaluation of the student's self-esteem)

5. 2 Analysis of free statements within the determined categories

The following part presents the analyses of the free statements in the individual categories of the experienced harm by the teacher's behaviour. The participants expressed their reminiscences in relation to all the levels of education. They are memories that express humiliation (compromising self-esteem), helplessness and feelings of anxiety.

5. 2. 1 Personality category

Regarding the representation of negative experience in the **personality** category, 63 participants out of the total of 123 provided their statement (i.e. 51.2%). The personality category included reminiscences related to the feelings of humiliation (compromised self-esteem) and experienced helplessness. There are four subcategories in this category, related to the time occurrence of the experience: preschool (N=22, i.e. 34.9%), elementary school (N=28, i.e. 44.4%), high school (N=14, i.e. 22.2%), university (N=5, i.e. 7.9 %).

Graph 2. Subcategories of the time occurrence of the experience under the personality category

The preschool subcategory included more detailed subcategories in relation to eating, sleeping, cleanliness and art education (graph 2).

In the **preschool subcategory** (22 participants), negative reminiscences related to eating (11 participants), sleeping (5 participants), cleanliness (4 participants) and art education (2 participants). For illustration, here are some specific statements, e.g. one woman (24 years old) expressed her childhood experience in the following way: *"I still don't like tomato soup that I was forced to eat at preschool. I almost feel like vomiting when I see it."* One man (23 years old) remembered a horrible experience: *"I was forced to eat and then force-fed by the teacher. Then, I threw up and I had to eat the food that I threw up. I sometimes meet the teacher and I still have a strong feeling of injustice"*. In relation to sleep, the participants expressed feelings of anxiety that they experienced during nap time. *"When we lied down, we all had to close our eyes, otherwise the teacher would put a bandana over our eyes"* (woman, 28 years old). In relation to cleanliness, the participants described

“accidents” that they still remember. *“I started going to preschool quite early and unfortunately, I had an accident. When we played outside, I didn’t make it to WC in time and I had to go number two. I still remember that the teacher showered me in front of all the children as an exemplary case so that it wouldn’t happen again”* (woman, 31 years old). Two female participants stated their recent experiences with their own children. One woman (34 years old) said: *“When my son started preschool, I noticed that his artwork was not on display with the other children’s works. When I asked the teacher about it, she said that he couldn’t draw. My son gradually stopped drawing at home as well... until his first grade teacher improved his relation to drawing thanks to her approach.”*

Twenty-eight participants provided reminiscences in the period of **elementary school**. Once again, they related to feelings of humiliation (compromised self-esteem) and helplessness. One woman (34 years old) stated: *“...we had an older teacher for technical education at elementary school who liked to mock his students... he wanted us to have our things in military order, arranged in “columns”, and he checked everything every lesson. When someone forgot to bring something, he didn’t have to stay after school but had to go to “consulting lessons” to learn not to forget things... every two week, when I knew we had two lessons of technical education, I felt sick from the morning. I still remember that after 21 years and it brings up unpleasant feelings.”* In a similar way, one man (26 years old) stated: *“...when I didn’t know something in mathematics, the teacher let me stand next to the blackboard all the lesson. He didn’t pay any attention to me but I still perceive it as terrible humiliation.”*

The period of **high school** included reminiscences of 14 participants, e.g. one woman (24 years old) stated the following: *“At high school, our physics teacher picked on me. Every lesson he would mock me, saying things like, oh, you’re the last one again, wrong again, nothing surprising etc., I still have nightmares about it and I don’t understand it.”*

As far as **university** is concerned, five participants provided their reminiscences. They all expressed a feeling of helplessness and humiliation when communication with a university teacher who was arrogant towards the students. *“I was always negatively paralysed by the arrogance and supremacy with which the professor behaved towards me”* (woman, 32 years old).

5. 2. 2 Appearance and physical properties category

In the **appearance and physical properties** category, eighteen participants described a negative experience (i.e. 14.6%). Two subcategories were registered in this category, related to the time occurrence of the negative experience: elementary school and high school (graph 3).

Graph 3. Subcategories of the time occurrence of the experience under the appearance and physical properties category

When we look at the **appearance and physical properties** category, a total of 18 participants stated their experience when a teacher pointed out their physical dispositions in an inappropriate manner. In all cases, it was inappropriate commenting on the appearance and physical look of the student. For example, one woman (32

years old) remembered an unpleasant statement of her history teacher at high school: “*Such a big head and so little inside*”. A high school teacher told one female student: “*Well, once again, you have to lift your heavy butt and walk to the blackboard*” (woman, 29 years old). All statements are linked with the theme of devaluing the physical properties and appearance of the student as an important aspect in the development of identity and personality presentation.

5. 2. 3 Disregarding performance category

As far as **disregarding performance** is concerned, a total of 22 participants provided answers (i.e. 17.9%). Three subcategories were registered in this category in relation to the time occurrence of the experience: elementary school (11 participants), high school (12 participants), university (4 participants), see Graph No. 4.

Graf 4. Subcategories of the time occurrence of the negative experience under the disregarding performance category

At **elementary** and **high school**, performance was disregarded in various subjects of study. Some of the specific statements were: “*You can’t even count how much you earn, you are so stupid*”, a mathematics teacher said repeatedly to an eighth grade student (woman, 25 years old). “*Wrong again. If stupidity bloomed, we’d have blooming flower patches all over here thanks to you*”, (woman, 27 years old). “*When I was at high school, my math teacher informed me that she won’t let me take the final exam in mathematics because I had C in the test result... then I had to go to her office to prove that I definitely wasn’t that bad. But I always left with a feeling that she was just playing with me. After the last re-examination, she told me to come on the following day again, that she would have to think about it. She did let me take the final exam in the end but I was so nervous until she told me that that I bit through my top lip, I couldn’t sleep, I was nauseous. I still remember it with horror to this day*”, (woman, 32 years old).

There were some examples of disregarding performance and activity in the memories of **university** (4 participants). “*At university, there was this professor that we were afraid to ask about anything. He personally told me once that my question was so stupid that it couldn’t be answered. And he said in front of the others that I should consider dropping out of school*” (woman, 29 years old). One participant (woman, 31 years old) described a situation when a university teacher returned her seminar work saying “*I’m not going to read this nonsense of yours, get a job in a bar, you’ll do well there.*”

5. 2. 4 Addressing category

When we look at the **addressing category** within the context of monitored devaluation of the student’s self-esteem, twenty-one participants provided their statement (i.e. 17.1%). Two subcategories were registered in this category, in relation to **using nicknames and misrepresentation of name**.

Twelve participants described their experience with inappropriate nicknames that teachers used to call them. “*At elementary school, I started wearing dental braces. Our form teacher had a “sense of humour” and he started calling me the Dentist. From then, he would not use any other name to address me and it was very unpleasant.*

About a year later, I accidentally told my mom about it and she went to the school and asked the teacher not to use that nickname. He was allegedly very surprised because he thought I was okay with it” (man, 22 years old). Another participant (24 years old) described a situation at high school: “The teacher came up with nicknames for all of us and started to use them. It was devastating for me because he decided to call me the “turtle”. I still think about his attitude, which I consider humiliating”. Five participants gave examples when a teacher misrepresented their names on purpose. One woman (31 years old) described the following experience from elementary school: “My last name was Tvarůžková (TN: tvarůžky is a smelly cheese made in Olomouc, CZ) and one teacher often called me our stinker etc. It was fun for everyone else but not for me. Fortunately, he only taught us for one year”. “My name is Ptáček (TN: a little bird) and one teacher liked to call me a sparrow (man, 27 years old). This subcategory included the statements of four participants who stated that they did not like it when an elementary teacher used their last names. Considering the fact that addressing a person is an important part of one’s identity, then all the stated reminiscences are linked with devaluation of the student’s personality.

5. 2. 5 Education category

Teaching subjects such as arts and music has a positive potential in schools. However, our participants had some devastating experiences in these lessons. Twenty-eight participants provided their statements in this category. There were three subcategories (see Graph No. 5) related to **physical education** (19 participants), **arts** (8 participants) and **music** (1 participant).

Graph 5. Subcategories in the education category (N=28)

The stated reminiscences regarding PE lessons can be illustrated as follows: “When I recall PE lessons at high school, I feel nauseous. I remember gymnastics when we had to the vault over the buck, I couldn’t do it and the teacher was quite loud about it. I used to have C from physical education in my school report, even though I did very well in the other subjects (woman, 30 years old). “You can’t do that, your butt is too big. That’s what my elementary PE teacher said about me in a PE class” (woman, 23 years old). Five participants stated their negative reminiscences about swimming lessons. “I still cannot swim, I used to get stomach ache before the swimming lessons. The most horrifying thing was the long pole that the teachers used to push us in water... it was horrible” (woman, 22 years old).

In art lessons, all participants mentioned the obvious disappointment of the teachers with their works. E.g. “What did you create again, this should be in the trash... this is what I still hear today when I remember one of my drawings that I really liked” (first year at elementary school, man, 23 years old). Similarly, in music lessons: “You should not even speak, let alone sing...” the teacher informs a student in fourth year at elementary school in front of the whole class. “I have never sung since then...” (man, 27 years old). All statements have one common aspect in the sense of inhibited motivation to perform in the given area, moreover, these statements are humiliating in relation to the student.

5. 2. 6 Unclassified category

Some of the statements belong in the **unclassified category**, in particular, statements provided by three participants who described reminiscences related to psychogenic harm in another environment than school. The participants stated their negative experience in the doctor-patient relationship.

6 Conclusion

There is no doubt about the moral level of any relationship, let alone the one between a teacher and a student. Above all, it is the mere fact that we contribute a moral value to our own behavior and the behavior of others. Moral evaluation always relates to something specifically human. It is possible to assume that everyone (thus a teacher as well) knows what is good and what is bad and that everyone knows that one should do good and not bad (Anzenbacher, 1994). The teacher should not only teach, but also raise his or her students, be a role model, cultivate the emotional and social aspects of their personality, their ethical attitudes and values.

6.1 Statement categories

Out of the total sample of 127 participants, 123 participants, i.e. 96.9% of the people addressed, provided their statements with regard to negative reminiscences from the school environment. Some reminiscences related to the experiences of the teacher-student relationship were in the recent past (in case of university), others reached further back in time (in case of statements about elementary school or preschool). The qualitative analysis of the individual statements is illustrated by the results of implemented coding. The stated quantitative data (frequency, %) are used for exemplifying the facts.

As stated, the majority of the participants experienced some emotionally hurting experience in the relationship with their teachers. More than a half of the participants expressed harm caused by the teacher in the **personality** category. This category showed to be the most frequent one. It included reminiscences where the participants felt humiliated by the teacher, accompanied with the feelings of helplessness and anxiety. All the statements are linked with the theme of compromising the student's self-esteem.

Almost 15% of the participants provided reminiscences in the categories of **appearance and physical properties** when the teacher commented on their physical appearance in an inappropriate manner. These categories included reminiscences related to the physical self, which becomes an important component of the self-system of the individual during adolescence.

Almost 18% of the participants stated **disregard of performance** when their performance or the effort to perform was disregarded by the teacher. The disregard of performance of the student by the teacher occurred at elementary school, high school as well as at university.

The negative feelings in the category of **addressing** had similar results, about 17% of participants stated a negative experience with inappropriate naming by the teacher. There are two subcategories in this category: nicknames and misrepresentation of the name.

The findings in the last category of **subject of study** are also alarming. About 23% of the participants stated their negative experience in the area of the subjects, most frequently situations of humiliation in the subcategories of physical education, then arts, and music. All reminiscences concerned the inhibiting effect of the teacher's approach on the student's interest, effort and thus impact on the fulfilment of the educational objectives in the individual subjects.

When we look at the aforesaid reminiscence categories, they are all linked with the theme of compromising self-esteem. As the findings in developmental psychology show, the judgements of close persons are very important for the development of self-esteem (Thorová, 2015; Mareš, 2013; Vágnerová, 2005; etc.) and these persons in

the system of education are, above all, teachers. When we consider the fact that the number of people who assess the child increases during the school attendance, then it is essential for the healthy development of personality that the child is accepted and assessed positively (Rogers, Freiberg, 1998). A positive evaluation by the surroundings is important in all developmental stages because it is natural that a person continuously strives to get a positive feedback from his or her surroundings and to have a positive opinion of himself or herself. The need to protect self-esteem may subsequently lead to avoidance of specific situations (activities) (Covington, Müller, 2001; Thorová, 2015).

6.2 Summary

Although it is known that a positive teacher-student relationship is fundamental for the educational process, we often experience the opposite in practice. The analysis of the free statements of the adult participants who remembered their experience from school using the reminiscence method indicates that all the statements (across the subcategories) are linked with one main motif. It is the experienced devaluation of the student's self-esteem due to the teacher's behaviour. If we take into consideration that self-esteem is the basic personality aspect and expresses the awareness of the level of perceiving one's value, then the impact of its disturbance on the student's personality is always undesirable. It affects the entire personality of the student at a motivation, emotional, cognitive and social level, and it inhibits his or her performance to some extent. The reminiscences can be expressed from various views. One of the explanations is the likelihood of the existence of the teacher's negative attitude towards students. Mareš (2013) states that this negative attitude makes it difficult for both parties to change the relationship. Such a teacher is much more critical to some students, his or her comments are full of negative emotions, irony and mocking. Also, Vágnerová (2005) points out that social perception and assessment of students depends on the professional experience and personality traits of the teacher. The teacher's attitude towards the individual students includes both intellect and emotions. According to the author, the main problem is not that the teacher often assesses students in a simplified manner, but that the teacher is not aware of that and that he or she is often not willing to admit the negative impact of his or her behaviour.

The manner in which the teacher approaches students, the way he or she speaks to the students, his or her facial expressions, how he or she evaluates their effort, all of that affects their school performance and their auto-reference. The student, whether experiencing a positive or negative attitude of the teacher, changes her effort, becomes more confident, or starts to have doubts about herself (Mareš, 2013). Although the development of self-esteem is also influenced by internal factors (temperament, social skills and the type of emotional experience), the emotional acceptance by close persons is fundamental for the healthy development of self-esteem and self-confidence of the student.

The results of the submitted study indicate an occurrence of the experience of negative emotions in contact with a generally significant personality, the teacher, in all five deduced categories. We are aware of the limits of our study, such as the selection of participants (students at the faculty of education), the method of data collection (free written statements), which provides for a level of subjective distortion, however, reminiscences at present document that it is an experience with subjective importance.

Within the context of traditionally required pedagogical-psychological competences of the teacher, our information in relation to the aforementioned results might sound a bit pessimistic. However, we believe that these facts should not be overlooked in the educational process. Considering the fact that our participants are studying in the field of education, we can optimistically assume that they have not been put off by their negative reminiscences and that they might be working towards empathy and quality communication with students.

Moral principles in relationships are fundamental for society as they always relate to something specifically human (Azenbacher, 1994) and they are especially important in education and upbringing (Vacek, 2017). The results of the qualitative analysis urge to reflect not only on some of the phenomena in Czech schools

(overloaded teachers, the burnout syndrome), but also on the university preparation of future teachers. We believe that it is important to discuss the ethical dimensions of human relationships, especially the ethical dimensions of the teacher-student relationship, with future teachers and to educate them in this sense better. In conclusion, we would like to emphasise that in spite of the stated facts we believe that most teachers do their job with love and corresponding pedagogical tact.

Abstract

The focus of this paper is to examine the interrelated influences of service delivery in institutions of higher education (HEIs) in Oman to advance sustainable education for smart cities. An important objective of this study is the evaluation of the pertinent educational curriculums and programs used by HEIs in Oman to stimulate and develop the sustainability of the smart city approach. Researchers intend to adopt aspects of the triple helix model, which have been used as an analytical framework to analyse the knowledge-based innovation systems in HEIs. Data is collected from stakeholders in HEIs through structured and semi-structured interviews, and questionnaires combined with statistical trends from officially published reports. Data analysis will keep with Lombardi et al., (2012) methodology and the employment of Stata software will help in the examination of correlation between variables. The study contributes to the debate on HEIs' role in smart city initiatives and has implications to their part in advancing higher education for the development of smart city initiatives in the region, which is an evolving concept that requiring ample investigation to further our understanding of it especially in developing countries.

Keywords: Sustainable education, smart city, institutions of higher education, technology, innovation

Introduction

Education has been revolutionized by technology and so higher education institutions (HEIs) must create a richer and inspiring experience in learning is crucial. HEIs need to know their position for them to benefit fully from current smart methods in education like social learning and networks as well as game-based learning. The current paper examines the educational setting in Omani HEIs as part of the smart city ecosystem. The study includes smart learning initiatives already in place and vital components of the curriculum that nurtures innovation among its alumnae, which is anticipated to have strategic consequences for the country, which is in the process of endorsing a smart learning education configuration. The smart city approach in Oman is still budding and there is a strong need to support this ecosystem. Some of the most important concepts relating to teaching are innovation, smart technology, and industrial innovation that power sustainability and these must be addressed for next students generation (Wolff, Kortuem, & Cavero, 2015).

Studies in the fields of smart cities have widely emphasized the positive impact of a smart city to “ tackle urban sustainability issue ” (Wolff et al., 2015; p.2), and the role of higher education institutions on stimulating and promoting innovation and smart cities. Meijer & Bolívar (2016) stated that “Smart technologies, smart collaboration, a highly educated population, and effective institutions are argued to be needed to face the challenges of modern cities” (p.393). Education has been widely discussed in the literature as one of the

significant elements for the development of the necessary human capital as well as technological infrastructures for a smart city (Caragliu, Del Bo, & Nijkamp, 2011; Hollands, 2008; Meijer & Bolívar, 2016). Promoting centres for a smart city at HEIs is important to develop the smart cities so that students can play their active and innovative roles in smart city initiatives (Winters, 2011). In that sense, the debate in the literature continues regarding either building the human capital first or the necessary technology (Nam & Pardo, 2011). The 2020 Europe strategy has focused on education, research and innovation areas as major factors in the promotion of smart cities (Cocchia, 2014).

Two clear gaps in the arena of smart city education inspire the present study. First, a few studies have been done in developing countries that explored education as the main player in stimulating smart city initiatives. This is in spite of the shared view that “a smart city is a humane city that has multiple opportunities to exploit its human potential and lead a creative life” (Nam & Pardo, 2011, p. 285). Though there are many instances from advanced economies, evidence of the influence of HEIs on supporting students to be more creative, innovative and able to create applications on smart city initiatives in developing economies continue to be rare (Fadaeenejad et al., 2014). Second, little answers are available in the literature that focuses on the part played by HEIs in developing countries and their sustainable education for smart cities (Liu, Huang, & Wosinski, 2017). Most studies focused on guesstimating the development of smart cities without observing the main factors that promote improved life in smart cities, which is mostly due to people (Winters, 2011).

The aim of this research is to review the relevant educational curriculums, activities, and programs used in Omani HEIs to encourage and advance the sustainability of the smart city ecosystem. Several studies suggest that people, education systems, learning, and knowledge or what they call “human dimensions” are the key aspects for smart cities approach (Cocchia, 2014). Furthermore, our study sheds light on the effectiveness of these HEIs education methods and strategies that are used to develop this concept, mostly among undergraduate students in Oman. A literature review indicated that such insights are still scarce especially with when it comes to developing countries.

Consequently, the present research aims mainly to contribute to the debate on smart city education at HEIs. This is because smart city education in developing regions is a budding notion and requires more research to advance our understanding of what it takes to build smart cities in the region. The study delivers thorough indications and analyses of the smart education situation in Omani universities and colleges, the effectiveness of curriculums, activities and programs used by HEIs in Oman to kindle and endorse the smart city approach through improved preparation of its graduates giving them the tools, settings and network to actively participate in the smart city movement. The study contains smart learning initiatives now in place that are anticipated to have strategic implications for the country. The second contribution of the research lies in the examination and confirmation of the triple helix model as an analytical framework for gauging the capabilities of HEIs in Oman. The end goal of this being to help decision makers strive for as well as cultivate the creativity and smart education necessary for building the human capital to promote the smart city approach.

To conclude this section, education has been revolutionized by technology and so HEIs must create a richer learning experience for its constituents. In turn, smart learning initiatives can have a vital role in nurturing innovation in and preparing alumnae for smart city initiatives. The smart city approach in Oman is still budding and there is a strong need to support this ecosystem. Some of the most important concepts with this regard are the fostering of innovation and smart technology that power sustainability and the current study hopes to address this gap by in the preparation of the next generation of students. (Wolff, Kortuem, & Cavero, 2015). With that respect, the role of HEIs in stimulating and promoting innovation and smart city initiatives is undeniable (Meijer & Bolívar, 2016). Moreover, a few studies have been done in developing countries that explored education as the main player in stimulating smart city initiatives. Little answers are available in the literature that focuses on the part played by HEIs in developing countries and their sustainable education for smart cities (Liu, Huang, &

Wosinski, 2017). Most studies focused on guesstimating the development of smart cities without observing the main factors that promote improved life in smart cities, which is mostly due to people (Winters, 2011). Finally, building on the grounds put forth in the above, this study aim at answering the following four main research questions:

1. What are the applicable curriculums and programs used by HEIs in Oman that can support and help in the development of a smart city in Oman?
2. Does the education system in Omani HEIs effectively support the development of smart city initiative?
3. What are the recommended methods to promote the interest of smart city approach among students?
4. Do Omani HEIs have the capabilities to strive and nurture a creative environment for smart city initiatives?

Furthermore, from the mentioned analysis the following study objectives emerged:

- I. Explore the impact of service delivery in Omani HEIs to develop sustainable education for smart cities.
- II. Adopt aspects of the triple helix model (Etzkowitz, 2008) that can be employed to analyze the knowledge-based innovation systems in HEIs.

Method

The smart city concept is made up of 'smart people' features and the level of educational services afforded that is fundamental to 'urban growth' and sustainable development (Winters, 2011). The present research project explores the relationship between the ability of Omani HEIs to implement smart education systems to develop human capital to its citizens and prepare them in the best way for smart city initiatives (Bătăgan & Boja, 2012).

In the current study, researchers implement aspects of the triple helix framework to analyse the knowledge-based innovation systems (Lombardi, Giordano, Farouh, & Yousef, 2012). In a recent paper, Etzkowitz (2008) stressed that the move towards a knowledge-based society has given universities a bigger role to play. In fact, the role of universities as originators of knowledge has become more valuable since innovation is increasingly based on science. Consequently, university, industry, and government have very equal responsibilities that it's not just one specific component that is necessarily the impetus of the triple helix model of innovation. For this reason, the increased potential role played by universities for smart city initiatives is being suggested particularly with regard to how technology transfer offices were set up by universities to promote the transformation of university research from commercial value to actual commercial goods.

To conclude this section, the methodology followed by researchers in the present work includes conducting structure and semi-structured interviews and discussions with relevant focus groups comprising of various stakeholders from the Omani HEIs including individuals in management, professional and decision making positions (public and private). Further, questionnaires are distributed to selected samples of the population such as students, academic and professional staff in HEIs in Oman (public and private). All this will be backed up by statistical trends and observations by policy makers and officially published reports.

Findings

The current study has HEIs performance in delivering smart sustainable education as the dependent variable estimated using five main categories that are based on the triple helix model. The research framework shows the proposed antecedents to HEIs performance with regard to smart city initiatives (Figure 1). These five categories are:

- 1) Smart Governance (related to participation)
- 2) Smart Economy (related to competitiveness)
- 3) Smart Human Capital Indicators (related to people)
- 4) Smart Living (related to the quality of life)
- 5) Smart Environment (related to natural resources)

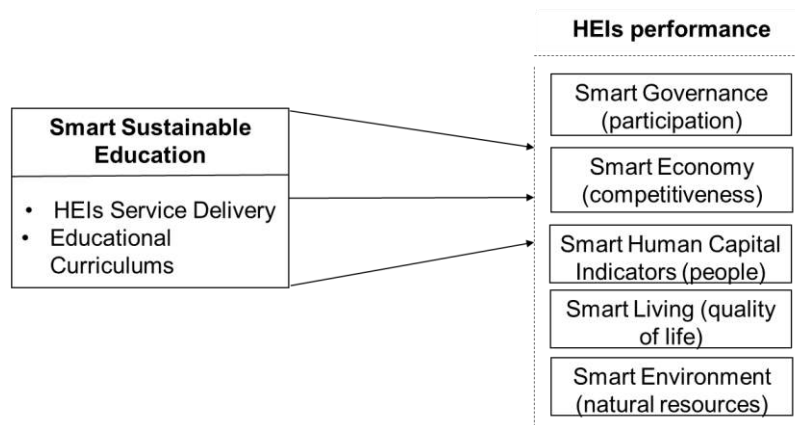

Figure 1. Research Framework

For the purpose of this study, an empirical examination requires the operationalization of the following variables and connecting them to the five main categories above in the triple helix model factors that are assessed in Omani HEIs (Caragliu et al., 2011; Hall et al., 2000; Lee & Hancock, 2012; Neirotti, De Marco, Cagliano, Mangano, & Scorrano, 2014):

1. Campus investment in infrastructures and building intelligence sustainability like building smart applications, network, smart access, data usage, using digital education (e.g. interactive whiteboards, e-learning systems), and smart green services, etc.
2. Investing in human capital by attracting talents and academics as well as collaborative partnerships
3. Students' awareness of smart city concepts in terms of curriculums, workshops, creative classes, and participating in local and international competitions.
4. Smart city governance by using prototypes to oversee smart city traditions.

Finally, data analysis will keep with the methodology employed by Lombardi et al., (2012) and software such as Stata to investigate the correlation between variables. For the time being, data will be collected from several sources including:

1. Conducting structure interview with top management, professional and decision makers at some selected HEIs in Oman (public and private). In addition to structured and semi-structured interviews, researchers need to use focus groups to gather important ideas and viewpoints from relevant stakeholders in HEIs, government, and industry on how to improve educational programs for smart city initiatives.
2. Distribution of a questionnaire from selected focus groups such as students, academic and other professionals in some selected HEIs in Oman (public and private).
3. Observing statistical trends from officially published reports

Conclusion

The primary contribution of the current paper with broad implications is a more profound understanding of the best practices that are implemented in HEI and what particular role they play in the development of smart city initiatives. This work attempts to examine the influences of service delivery in HEIs on the development of sustainable education for smart cities in Oman. The study reviews the relevant educational curriculums, activities, and programs used by HEIs that are needed to stimulate and develop the sustainability of smart city initiatives. Researchers adopt aspects of the triple helix model, which have been used as an analytical framework to analyse the knowledge-based innovation mechanisms in HEIs. Data collected from various stakeholders in HEIs through structured interviews, and questionnaires and statistical trends collected from official published reports can reveal considerable information about the HEI effectiveness in that regard. The study contributes to

the debate of HEIs' role in smart city initiatives and has implications to their role in education for smart city initiatives developing in the region, which is an emerging concept that demands more research to improve our understanding particularly in developing countries.

In conclusion, to narrow down the scope of the current paper, researchers must make their way backward from the long-term government and universities plans to the present state to figure out the missing links that need addressing. Further research is required to find practical ways to evaluate educational curriculums and programs used by HEIs. Moreover, in-depth expertise of specific aspects of the triple helix model must be uncovered before using it as an analytical framework to analyse the knowledge-based innovation systems in HEIs. Finally, combining Lombardi et al, (2012) methods in collecting and analysing data with focus group interviews will need further exploration for practical implementation in the current study.

Abstract

This research was carried out in order to reveal the stages of the reality shock experienced by teachers who started to work in different branches and what effects they created. The research was conducted in phenomenological research design, one of the qualitative research methods. The participants consisted of sixteen different branch teachers who were selected with the criterion sampling technique, which is one of the purposive sampling techniques. In the study, the phenomenological research design was used and attention was paid to ensure that the participants were teachers with 0 to 2 years of experience. Data were obtained by semi-structured interview form and analyzed by content analysis technique. The reality shock of the teachers was discussed in five stages: expectation, frustration/shock, survival, recovery and reflection. The data obtained from the research show that the reasons for the reality shock experienced by the teachers include lack of support from colleagues and administration, coping with student problems, and cooperation with other teachers. It is stated that the reality shock causes situations such as loss of motivation, isolation and losing enthusiasm for work.

Keywords: Teacher, Reality Shock, Disappointment

1. Introduction

1.1. Reality Shock

The concept of reality shock was first defined by Marlene Kramer in the 1970s as a result of her researches following the transition from student to professional nursing by newly graduated nurses (Çalışkan, 2010). It is seen that the expectations of the newly graduated nurses in their first work experiences, patient care practices and job descriptions differ with those taught in university education. Kramer called reality shock a conflict of values and expectations experienced by newly graduated nurses when they started to work. Reality shock is a universal phenomenon and reaction that emerges when people begin to see that the ideals and values learned in school are not used in professional life when they start working after many years of difficult preparatory (Scott, 1992). The reality shock, also called as the role transition, causes many of the new nurses to change jobs or leave the profession early in their career (Duchscher, 2009).

Veenman stated that the transition from pre-service training to the first teaching experience can be dramatic and traumatic, and he first dealt with the concept of reality shock defined in the nursing field from the perspective of individuals who have experienced the first teaching experience. Known as “transition shock” and “application shock” in English and German literature (Veenman, 1984), reality shock is defined as the frustration arising from the mismatch of real-life events with the information received by newly graduated teachers who have been introduced to the professional life for the first time. According to Veenman (1984), this phenomenon called reality shock does not last for a short time as a swimmer gets used to cold water and constantly affects individuals in the first teaching experience.

An individual who starts to work for the first time in an institution learns the expectations, values and rules of the institution in the process. In this process, which is also defined as organizational socialization by Dean, Ferris and Konstans (1985), individuals are involved with their own values and expectations as well as the

requirements of the institution and work. As a result of the fact that the expectations of newly recruited individuals are different from the experiences in the organization, the "reality shock" emerges (Dean, Ferris and Konstans, 1985).

1.2. The Stages of Reality Shock

1.2.1. The Stages of Reality Shock According to Kramer

According to Kramer, reality shock has several stages, including honeymoon, shock, healing and dissolution (Carroll, 2007).

1.2.1.1. Honeymoon Stage

The honeymoon stage occurs only when the best aspects of the job are seen immediately after the person starts work (Carroll, 2007). During the honeymoon stage, the person starts working with feelings of admiration. He sees working life charming and through rose-colored glasses (Scott, 1992). According to newly graduated nurses, during the honeymoon stage, the good things they experience outweigh the negative experiences (Carroll, 2007). Other experienced nurses in the workplace welcome them for a while, ignoring their mistakes. However, after a while, prizes and appreciation disappear and the honeymoon stage ends (Scott, 1992).

1.2.1.2. Shock Stage

The shock stage arises when the expectation differences between being a student and being a nurse in professional life are fully seen. These differences in expectations and contradictions reveal reality shock (Carroll, 2007). The situation in the honeymoon stage is expected to end as soon as possible and the newly graduated nurse is expected to behave like other nurses. Reactions to reality shock at this stage vary from person to person. Rejection and regression behaviors are generally observed. At this stage, one feels insufficient, blames himself, sees his education as inadequate, often experiences feelings of anger and hostility. Fatigue, illness and depression can be observed as a common symptom of all these feelings (Scott, 1992).

1.2.1.3. Recovery Stage

The recovery stage involves the new graduate gaining a balanced and changed view of the professional world. The new graduate maintains a commitment to learning but acknowledges that he will focus primarily on the current task required by the professional environment (Carroll, 2007). Self-discovery, recognizing the entertaining aspects of the work, continuing to be informed are indicators of the recovery stage. In this stage, the tension of the person decreases (Scott, 1992).

1.2.1.4. Dissolution Stage

The resolution of these conflicts experienced by the newly graduated nurse occurs when she internalizes the values of the professional life and the expectations of the institution in which she works and creates new expectations. When the newly graduated nurses realize that they are able to manage their responsibilities about their patients and complete their shift duties, the dissolution stage is noticed. They start to hear good things from their managers, colleagues, and most importantly from the patients they look after and responsible for. As newly graduated nurses acquire a sense of purpose and success, dissolution occurs (Carroll, 2007).

1.2.2. Reality Shock Stages According to Moir

In his research, Moir (1999) states that the initial teaching experience is challenging and that each teacher goes through various stages. In this research, he mentioned the stages in which the newly recruited teachers go through and that it is important to understand these stages in order to support the newly recruited teachers.

1.2.2.1. Expectation Stage

The expectation stage is a stage in which the teacher is excited, anxious, and mostly takes place in the first weeks of school. The newly recruited teachers have idealistic ideas about how to achieve their goals (Moir, 1999).

1.2.2.2. Disappointment Stage

Newly-appointed teachers are disappointed after six to eight weeks of unremitting work and stress. The density and length of this stage vary from teacher to teacher. The teacher, starting to realize that things are not going as he wants and with disappointment, confusion and stress, starts to doubt himself and question his own competences. Difficulties in classroom management are a major problem in the disappointment stage. The self-esteem of the new teacher decreases and questions his / her professional competences. For the newly recruited teacher, this stage is very challenging and the reality shock is very intense (Moir, 1999).

1.2.2.3. Survival Stage

The first months of school are very challenging for new teachers. At a very fast pace, they are intensely exposed to unexpected problems. Although they have received teacher training, they are confronted with the fact that pre-service training is different from reality in the classroom environment. Responsibilities such as curriculum, daily lesson planning, and managing students are an overwhelming burden for the teacher. At this stage, the newly-recruited teacher tries to cope with the reality shock and to survive (Moir, 1999).

1.2.2.4. Recovery Stage

The recovery stage usually begins with the arrival of semester holiday and continues until the spring. In this stage, the new teacher continues his normal lifestyle with activities such as resting, exercising, sparing time for himself and spending time with family and friends. After this good break, the teacher gains a wider perspective with renewed hopes. This holiday offers the opportunity to organize new teachers' materials and to plan their curricula. At this stage, new teachers focus on the curriculum with long-term planning and development of teaching strategies. Thanks to their experiences in the first half of the year, teachers gain the ability to prevent, reduce or manage many problems that may occur (Moir, 1999).

1.2.2.5. Reflection Stage

In the reflection stage that starts towards the end of the school year, the teacher who is new in his profession evaluates his success and failures considering his school year. In the following year, the new teacher intends to plan on management, curriculum and teaching strategies. Then the new teacher enters a new stage of expectation about how the next years will pass (Moir, 1999).

This study was conducted to reveal the views of the teachers who were in the first 2 years of their work on the stages of reality shock and the effects of reality shock. The research question and sub-research questions created for this purpose are as follows:

What are teachers' views on reality shock processes?

On what subjects do teachers experience reality shock?

How does the process go after the shock?

What are the causes of reality shock?

How do teachers deal with reality shock?

2. Method

2.1. Research Design

The research was conducted in the phenomenological research design which is one of the qualitative research methods. Phenomenology studies focus on cases in which individuals are aware of, but do not have an in-depth and detailed understanding (Crompton, 2002; cited in Büyüköztürk, 2012). In the phenomenology studies, the sources from which the data are obtained consist of individuals or groups living the case (Büyüköztürk, 2012).

2.2. Study Group

The participants consist of sixteen different branch teachers who were selected with the criterion sampling technique, which is one of the purposive sampling techniques. It has been paid attention that the teachers who will participate in the study are in the first 2 years of their commencement. In the criterion sampling technique, situations that meet a predetermined set of criteria are studied (Yıldırım and Şimşek, 2008). The study group characteristics are given in Table 1.

When the study group was examined, there were a total of 16 teachers, four of whom were each from pre-school, primary, secondary and high school. 8 of the teachers are women and 8 are men. 9 of them work in public schools and 7 work in private schools.

Table 1. Study Group Characteristics

Code	Branch	Age	Experience	Gender	Level	Type of School
Tchr 1	Primary School	24	1.5 years	Male	Primary	Public
Tchr 2	Counselor	24	2 years	Male	High School	Private
Tchr 3	Preschool	24	1 year	Female	Preschool	Private
Tchr 4	Preschool	24	2 years	Female	Preschool	Private
Tchr 5	Physical Edu.	21	9 months	Male	Primary	Public
Tchr 6	Primary School	24	2 years	Female	Primary	Private
Tchr 7	Counselor	24	2 years	Female	Secondary	Public
Tchr 8	Preschool	25	1 year	Male	Preschool	Public
Tchr 9	Counselor	26	2 years	Female	Secondary	Public
Tchr 10	Primary School	25	2 years	Female	Primary	Public
Tchr 11	Preschool	26	1 year	Male	Preschool	Public
Tchr 12	Counselor	25	2 years	Male	Secondary	Public
Tchr 13	Science	27	2 years	Male	Secondary	Public
Tchr 14	Geography	26	1 year	Female	High School	Private
Tchr 15	Vocational	24	2 years	Female	High School	Private
Tchr 16	English	27	1 year	Male	High School	Private

When the distribution of teachers by branches is examined, it can be seen that there are 4 counselor teachers, 4 preschool teachers, 3 primary school teachers, 1 physical education teacher, 1 science teacher, 1 geography teacher, 1 vocational teacher and 1 English teacher.

2.3. Data Collection Tools

Data were collected through face-to-face and telephone interviews. Semi-structured interview form was used to collect data during the interviews. The first part of the semi-structured interview form contains general information about the interviewees. In the continuation of the interview form, there are interview questions about the stages of reality shock in the workplace. Interview (Büyüköztürk, 2012) is the process of collecting data from related people in line with the questions sought in the research. The interview provides in-depth information about a designated research topic or a question.

Table 2. Data Collection Tool 1 - Interview Questions

--	--	---	---	---

2.4. Data Collection and Analysis

While collecting the research data, firstly the participants were informed about the purpose of the research. The permission was obtained by stating that the interviews would be recorded by the researcher by recording audio or by writing on paper. In addition, the participants were asked to give pseudonyms to indicate their gender and it was stated that the pseudonyms would be included in the research without using their own names. The interviews lasted approximately 30 minutes and the contents of the interviews were transcribed.

3. Results

The findings obtained from the research are shown in the tables below. When the teachers who participated in the research were asked “What do you think is the reality shock?”, some of the answers received are as follows:

“There is a world that we dream of in college, and when there is a difference between the world I enter into and what I imagine, I call it a reality shock.” (Tchr 2).

“It is getting surprised about what you have become when you start working, not like in the school, the situation when you understand this.” (Tchr 6).

“The sudden reality like hearing news of a relative’s death comes to my mind.” (Tchr. 8).

“What you dream is different from what you actually meet. Like the difference between theory and practice.” (Tchr. 7).

When Table 3 is examined, it is seen that the teachers who participated in the research had various expectations from their school, their colleagues and their students in their first years. In addition, teachers start with personal expectations such as self-improvement and appreciation of their branches, and professional expectations such as transferring the theoretical knowledge they have learned at the university to practice. The expectations of the teachers about their colleagues and administrations are more about support and cooperation, and their expectations of students are about caring for the lesson and being academically successful. Below are some of the answers that teachers have given about what they have come to expect from the school where they work.

“I expect my institution to stand behind me in every sense. In any case, I want him to have a supportive stance towards the student, saying that our teacher knows something about what he does.” (Tchr 14)

“I would expect the administrators to be fair and supportive.” (Tchr 3)

“I would like other teachers to collaborate for the need for toys, activities and be enterprising.” (Tchr 8)

“Collaboration, sharing the environment, that's what you expect from the senior.” (Tchr 13)

“I expected more from the student. It may be from my own studentship, but I found a profile below my expectations while I expected them to have more responsibility, more enthusiasm and more knowledge.” (Tchr 15)

“The difference between the student profile where I did my internship and the student profile here was a reality shock for me. The students there were quiet, calm, eager to listen, willing and with an academic background. The group here is a little different, I've had a hard time getting used to it, and I'm still having difficulty.” (Tchr 16)

“I had come to expect that the architectural structure and design of the school was more smooth and aesthetic.” (Tchr 3)

“Because of my branch, I would have expected a large enough space and hall.” (Tchr 5)

“At least I was expecting kindergarten like the places where we did internships, toys etc. ...There are 110 students and 1 toilet. I expected physical conditions to be good.” (Tchr 11)

“I expected something close to the psychological counseling we were trained in.” (Tchr 7)

“We learned to do psychological counseling at school, but I did it with maybe 10 students a year, obviously, it did not meet my expectations. This reduced my level of professional satisfaction. I have to push things to do something. I cannot put the theory we learned at university into practice in public school.” (Tchr 9).

“I was expecting my qualifications to increase, to improve myself.” (Tchr 11)

“I came to help them and improve myself because the resources were low.” (Tchr 8)

Table 3. Expectations

Theme	Sub-Theme	Codes
Expectation	Expectations for Management	Close relationship and communication with managers (Tchr 1, Tchr 5, Tchr 11) Supportive management (Tchr 3, Tchr 8, Tchr 12, Tchr 14, Tchr 15) Fair management (Tchr 3) Understanding management (Tchr 6, Tchr 10) Salary (Tchr 1, Tchr 2) Working hours (Tchr 2) Related administration (Tchr 5) Tolerant management (Tchr 16)
	Expectations for Teacher	Teamwork (Tchr 2) Effective communication between teachers (Tchr 3, Tchr 4) Good communication with colleagues (Tchr 6) Collaboration between colleagues (Tchr 4, Tchr 8, Tchr 11, Tchr 12, Tchr 13) Cooperation between colleagues (Tchr 4, Tchr 15) Transfer of experience between teachers (Tchr 5) Guiding colleagues (Tchr 5, Tchr 14, Tchr 15) Tolerant teacher approach (Tchr 16)
	Expectations for Students	Student without problems (Tchr 6) Respectful student (Tchr 5) Willing student (Tchr 5, Tchr 15) Student with a good academic background (Tchr 15, Tchr 16)
	Expectations for Profession / Branch	Working in accordance with the job description (Tchr 2, Tchr 7, Tchr 9) Valuing the branch (Tchr 2, Tchr 7, Tchr 9) Caring for student interviews (Tchr 2) Transferring theoretical knowledge to practice (Tchr 7, Tchr 9, Tchr 11)

	Positive attitude towards the branch (Tchr 9, Tchr 12)
Expectations for School and Environment	An aesthetic school with good physical facilities (Tchr 3, Tchr 5 Tchr 11) School without problems (Tchr 6) Systematic school (Tchr 4) Terror zone (Tchr 10) Having basic tools and equipment of the branch (Tchr 3, Tchr 5 Tchr 11) A good place to be appointed with the point from public personnel selection examination (Tchr 11)
Personal Expectations	Self-development (Tchr 8, Tchr 11) Improving professional competencies (Tchr 11) Touching students' lives (Tchr 12, Tchr 13) Being able to help students (Tchr 8)

Teachers begin to work with various expectations from colleagues, administration and students. Table 4 shows that some of these expectations disappoint teachers. Issues such as threatening and distant attitude of the administration instead of a supportive, warm attitude, lack of collaboration of colleagues, low interest and success of students, lack of opportunities, tools, lack of appreciation of the profession and the mismatch between what is learned in theory and real-life practices constitute the disappointments experienced by teachers. Some of the expressions in which teachers express their frustrations are given below.

“The deputy directors are constantly threatening and questioning such as investigations and expulsions, and therefore the decline in efficiency. They let me down.” (Tchr 1)

“The administration cannot empathize; they scare by threatening to open an investigation because they are from here.” (Tchr 10)

“Unity in terms of work with colleagues is limited, communication is inefficient.” (Tchr 11)

“The lack of cooperation between teachers and administration was disappointing. It is not fully effective in the development of students because there is no consensus among teachers as school culture.” (Tchr 13)

“The students say that they haven't been able to enter anywhere and stayed here among themselves. The student profile was disappointing.” (Tchr 16)

“The issues that came to me were not the same with the training we received in theory.” (Tchr 7)

Table 4. Disappointing Topics

Theme	Sub Theme	Codes
	Disappointment Related to Management	The threatening attitude of the administration (Tchr 1, Tchr 10) Non-warm, distant attitude of the administration (Tchr 1) Communication with the administration (Tchr 4, Tchr 5, Tchr 11) Lack of support from the administration (Tchr 4) Non-compliance, inconsistency with management (Tchr 4) Lack of understanding of the administration (Tchr 6, Tchr 10) The administration's neglected attitude (Tchr 8) Inelasticity of administration (Tchr 10) Pressure of the administration (Tchr 10) Negative management attitude (Tchr 12) Cooperation with the administration (Tchr 13)
	Disappointment Related to Colleagues	The lack of equipment and inadequacy of colleagues (Tchr 3) Teachers' neglected attitude (Tchr 8)

Disappointing Topics		Teachers' lack of cooperation (Tchr 9, Tchr 11, Tchr 13)
		Negative teacher attitude (Tchr 12)
		Non-support for student problems (Tchr 14)
		Grouping among teachers (Tchr 15)
	Disappointment Related to Students	Students' being indifferent to the course (Tchr 5)
		Low awareness of students (Tchr 7)
		Student problems on meaningless issues (Tchr 7)
		Failure of the student profile (Tchr 16)
		Negative student attitudes (Tchr 16)
		The student's not seeing the teacher as an authority (Tchr 16)
	Salary (Tchr 2, Tchr 6)	
Disappointment Related to Working Conditions	Working hours (Tchr 2)	
	Responsibilities not conforming to the job description (Tchr 2)	
Disappointment Related to University Education	Difference between theory and practice (Tchr 7, Tchr 9)	
Disappointment Related to School Structure and Equipment	Architectural, aesthetic structure of the school (Tchr 3)	
	Lack of tools and equipment (Tchr 3, Tchr 5, Tchr 11)	
	Lack of a teacher's area (Tchr 3)	
	Crowded classes (Tchr 6, Tchr 7, Tchr 9)	
Disappointment Related to Parents	Low level of awareness of parents (Tchr 7)	
	Inability to reach parents (Tchr 9)	
	Parents' not seeing the teacher as the authority (Tchr 16)	
Disappointment Related to Social Environment and Culture	Environment (Tchr 12)	
	Cultural features (Tchr 12)	
	Poor physical conditions (Tchr 11)	
Disappointment Related to Job	Dealing with students (Tchr 3)	
	Failure to do the job (Tchr 7)	
	Failure to value the profession, branch (Tchr 9, Tchr 13)	
	The applications for the branch being different than expected (Tchr 9)	
	Inadequate to students (Tchr 15)	
	Inability to reach students (Tchr 15)	
	Not showing respect for teaching (Tchr 16)	

“Salary, working hours, the obligation to attend classes, entering the classes during counseling hours, neglected the size of counseling disappointed.” (Tchr 2)

“The architectural structure did not satisfy me in terms of aesthetics. The equipment was insufficient.” (Tchr 3)

“At least I was expecting kindergarten like the places where we did internships, toys etc. ... There are 110 students and 1 toilet. I expected physical conditions to be good. Not half of my expectations, none met.” (Tchr 11).

“The environment and the cultural features disappointed me. They don't send 15-year-old girls to school, and the student doesn't come. She's thinking about dropping out at 8.” (Tchr 12)

“There is an intense prejudice against the counseling service in the workplace, it is very sad to encounter them. I was even crying when I met them. For example, they say, what do you do? These prejudices have disappointed me.” (Tchr 9)

Teachers who are at the beginning of their professions show emotional, behavioral and intellectual reactions to their disappointments. When Table 5 was examined, it is seen that teachers felt various emotions such as unhappiness, sadness, reluctance, anger, professional dissatisfaction in the face of frustration; they engaged in

behaviors such as ignoring, accustoming, communicating with the related people for the solution of the problem, adapting and questioning themselves and their competences. Below are some of the teachers' responses to their disappointments.

Table 5. Reactions to Disappointment

Theme	Sub Theme	Codes
Reactions to Disappointment	Emotional Reactions	Sadness (Tchr 2, Tchr 8, Tchr 9, Tchr 12, Tchr 14, Tchr 15)
		Getting angry (Tchr 2, Tchr 5, Tchr 8, Tchr 9)
		Feeling like someone who doesn't know how to swim, is in the water and nobody helps (Tchr 3)
		Anxiety (Tchr 3)
		Reluctance to go to school, work (Tchr 3, Tchr 16)
		Unhappiness (Tchr 3, Tchr 9)
		Perplexity (Tchr 4, Tchr 13)
		Low motivation (Tchr 4, Tchr 12, Tchr 14)
		Feeling of inadequacy (Tchr 7, Tchr 9, Tchr 14)
		Inability to obtain professional satisfaction (Tchr 7, Tchr 9, Tchr 11)
		Disappointment (Tchr 8, Tchr 9)
		Feeling helpless (Tchr 10)
		Feeling regressed professionally (Tchr 11)
		Being shocked (Tchr 14)
		Uneasiness (Tchr 15)
	Emotion-state confusion (Tchr 15)	
	Behavioral Reactions	Adapting to the environment (Tchr 1, Tchr 16)
		Creating own style (Tchr 1)
		Talking with the administration (Tchr 2, Tchr 4)
		Getting used to (Tchr 4, Tchr 8)
		Searching for a new job (Tchr 6)
		Closure (Tchr 9)
		Crying (Tchr 9)
		Complaining to the top authorities (Tchr 10)
		Sharing with friends (Tchr 10)
		Self-abstraction (Tchr 12, Tchr 14)
		Ignoring (Tchr 12)
		Decreased performance (Tchr 15)
	Self-development (Tchr 13)	
	Not to give up (Tchr 13)	
	Intellectual Reactions	Self-questioning (Tchr 6, Tchr 8, Tchr 11, Tchr 16)
		Minding (Tchr 16)
		The end of idealist ideas (Tchr 11)

“I didn't know how to handle them. I felt like someone who didn't know how to swim but was stuck in the water and no one helped.” (Tchr 3).

“It created the idea of inadequacy in me. I wondered if I am like this or everyone is the same. These situations I have experienced created sadness, unhappiness, withdrawal and anger especially last year.” (Tchr 9)

“.... The teacher interpreted it as if I were a new one and there was a lack of teaching in me. This was reflected to me as follows, if there is a problem with the student do not ask anyone, I closed myself.” (Tchr 14)

“These situations create professional dissatisfaction and I want to be good at my job. You're going into the interrogation process, like you've learned so much, and you can't apply.” (Tchr 11)

Table 6. Solution Strategies

Theme	Sub Theme	Codes
Solution Strategies	Meeting with the Administration and Authorized Authorities	Talking with the administration (Tchr 2, Tchr 3, Tchr 5, Tchr 12) Meeting with top officials (Tchr 10)
	Sharing With Family And Friends	Meeting with close friends and family (Tchr 1, Tchr 14)
	Getting Colleague Support	Communicating with colleagues (Tchr 5, Tchr 12, Tchr 15) Finding solutions with colleagues (Tchr 10) Having chat with colleagues (Tchr 10) Mediation (Tchr 10)
	Looking for a New Job	Appointment to the state (Tchr 2, Tchr 6) Looking for a new job (Tchr 6)
	Acceptance, Adaptation	Adapting (Tchr 1) Implementing expectations (Tchr 7, Tchr 15) Organizing the work according to the conditions of the school (Tchr 7) Accepting the terms (Tchr 11)
	Withdrawing	Withdrawal (Tchr 4, Tchr 12) Ignoring (Tchr 4) Giving up (Tchr 12) Cutting off communication (Tchr 12)
	Focusing on Professional Activities	Receiving professional training to improve oneself (Tchr 9, Tchr 14) Doing different activities for the benefit of students (Tchr 12, Tchr 13) Developing projects (Tchr 13) Using different teaching techniques (Tchr 16) Adding students to class (Tchr 16)
	Personal Efforts	Creating alternatives (Tchr 3) Doing something with the existing facilities (Tchr 8) Trying to change the perspective of problems (Tchr 9, Tchr 15, Tchr 16) Breathing exercise (Tchr 9) Taking own time (Tchr 9) Having occupations good for your own (Tchr 9) Not bringing home work (Tchr 9) Doing your best (Tchr 9, Tchr 11, Tchr 15) Trying to see the positive aspects (Tchr 11) Motivating yourself (Tchr 14)

When Table 6 is examined, it is seen how teachers try to cope with the reality shock they experience as a result of not meeting some or many of these expectations in their work which they started with various expectations. It is seen that teachers try various strategies such as meeting with the administration and colleagues about the problem, asking for support, sharing with family and close friends, and accepting the existing situation in order to cope with the feelings of disappointment, unhappiness and incompetence caused by reality shock. While some of the teachers try to cope with the effects of this situation with their personal efforts such as concentrating on professional studies, allocating time for themselves, motivating oneself, participating in trainings to develop oneself, some of the teachers show behaviors like changing jobs, becoming introverted and giving up against the negative emotions caused by reality shock. Below are some of the answers that teachers have given to what strategies they apply to their disappointments.

“I tried to talk to the administrators and teachers for support and solution. But I couldn't find support. There was no solution for financial reasons.” (Tchr 3)

“I'm looking for a new school, waiting. Or should I be appointed to the state?” (Tchr 6)

“I tried to lower my expectation. If I continue with the same expectations, I hit the same shield and fall back. I realized that I was happier when there was less expectation. When you have very high expectations and are not met, you fall to the bottom.” (Tchr 15)

“Supervision trainings take place first. I joined them several times and received training from outside.” (Tchr 9)

“We have overcome it by trying to see the positive side of it, accepting the conditions, trying to do our best.” (Tchr 11)

Table 7 shows from whom the teachers get support to cope with the effects of reality shock. It is seen that teachers share this situation with their colleagues they feel close to, family and friends, they ask for support from them, and besides this, some teachers also get support from other institutions and organizations such as non-governmental organizations and counseling and research center.

“I met with my friends and non-governmental organizations; we tried to do something with them. We checked what can be done, we did something to improve but it may not have been enough.” (Tchr 8)

“I consulted my colleagues, I consulted my group. I consulted my experienced colleagues, that knowledge is something else. I took advantage of the school counseling service. Talking to people who had more experience or ideas led me.” (Tchr 15)

Table 7. Support Resources

Theme	Sub Theme	Codes
Support Resources	Immediate Environment	Family (Tchr 1, Tchr 14)
	Support	Friend (Tchr 1, Tchr 7, Tchr 8, Tchr 13, Tchr 14)
	Colleague Support	Teacher (Tchr 1, Tchr 2, Tchr 3, Tchr 4, Tchr 5, Tchr 6, Tchr 9, Tchr 10, Tchr 11, Tchr 12, Tchr 15, Tchr 16) Administrator (Tchr 3, Tchr 16)
	Other	Counseling and research center (Tchr 7) Non-Governmental Organizations (Tchr 8) Project partners (Tchr 13)

Table 8 shows what kind of solution strategies teachers use to cope with the effects of reality shock. Teachers use a number of solutions, such as personal efforts, getting support from someone, meeting related people, adapting, withdrawing. Table 8 shows the results of these strategies. When Table 8 is examined, it is seen that as a result of these solutions, the teachers adapt, trust themselves, feel more adequate, teaching-learning experiences become more enjoyable and negative feelings like disappointment, dissatisfaction, reluctance, unhappiness are replaced by positive feelings like success, competence, happiness and pleasure. However, there are situations where the strategies developed for the solution do not work and as a result, negative feelings, behaviors and attitudes such as wanting to quit the job, giving up and not making efforts are continuing.

“Talking with my friends and motivating myself rebuilt my self-confident more. Being able to do it, being enough continues to improve my self-confidence. I'm happy when I'm good at work, but when I feel inadequate, it's reflected in my private life, and I'm unhappy.” (Tchr 14)

“I can say that all of this has improved me professionally, and after the acceptance process, I learned new things, such as the things you are asked to do and what you should not do. My coping skills have also increased.” (Tchr 2)

“Some worked, some did not. When it does, it creates a sense of accomplishment, pleasure, personal satisfaction, and happiness. When parents and teachers are successful, they are appreciated from the environment.” (Tchr 8)

Table 8. Results of Strategies Applied

Theme	Sub Theme	Codes
Results of Strategies Applied	Adapting	Fitting the environment (Tchr 1) Ensuring acceptance (Tchr 2, Tchr 11) Compromising (Tchr 10)
	Self Confidence	Increased self-confidence (Tchr 9, Tchr 14) Feeling self-sufficient (Tchr 16)
	Positive Learning - Teaching Experience	Making the course enjoyable, lively (Tchr 13, Tchr 16) Inclusion of students (Tchr 16)
	Increased Personal Competencies	Self and professional development (Tchr 2, Tchr 5, Tchr 9, Tchr 13) Increased coping skills (Tchr 2, Tchr 9) Being creative (Tchr 3, Tchr 7) Being productive (Tchr 3) Increased tolerance level (Tchr 15)
	Having Positive Emotions, Thoughts, Behaviors and Attitudes	Gaining different perspectives (Tchr 2) Increased motivation (Tchr 7) Sense of pleasure (Tchr 8) Professional satisfaction (Tchr 8) Happiness (Tchr 8, Tchr 12, Tchr 14) Feeling good (Tchr 9, Tchr 15) Striving to do your best (Tchr 11) Maintaining their ideals (Tchr 13) Making the love of profession continuous (Tchr 13)
	Settlement of Negative Feelings, Thoughts, Behaviors and Attitudes	Quitting (Tchr 4) Going on being angry (Tchr 4) Withdrawing (Tchr 4) Stress (Tchr 6) Disappointment (Tchr 8) Defeat (Tchr 8) Submission (Tchr 10) Being limited (Tchr 12) Not making an effort (Tchr 15) Wishing to quit (Tchr 16)

“I mean, I tried to talk about what I went through, but it wasn't very effective. I stepped back a bit, I quit. I kept being nervous to myself.” (Tchr 4)

Table 9 shows the findings of the causes of the reality shock experienced by the teachers. In the first years of their work, teachers start with various expectations from the administration, colleagues, students and parents. Besides, the teacher has expectations about university education, profession and himself. The reasons for the reality shock resulting from these expectations and their real-life responses are inadequate university education and internship practices, incompatibility with real-life experiences, inexperience, negative approach of administration and colleagues, lack of value for work, limited opportunities, and insufficient vision.

‘I think they were because of the manager's mistake ... The manager, the assistant manager just resigned yesterday. They're not professionals.’ (Tchr 6)

“I had frustration, lack of self-esteem, inadequacy. I'm better now, I think I'm better at dealing with them now. I'm getting used to it.” (Tchr 9)

“I was worried. Because in theory, I didn't see it that way. In theory, the plan, the program, everything was perfect but the practice was different.” (Tchr 3)

“It was due to me being an inexperienced teacher, being too dignified, not following a policy that was very harsh and intimidating the students and students' benefiting from this.” (Tchr 16)

Table 9. Reasons for Reality Shock

Theme	Sub Theme	Codes
Reasons for Reality Shock	Reasons Caused by Administration And Colleague	Negative approach of the administration (Tchr 1, Tchr 4, Tchr 6, Tchr 10, Tchr 11, Tchr 12) Ignoring problems (Tchr 5) Not being professional (Tchr 6) Lack of a principled working order (Tchr 5) Lack of communication with the administration and teachers (Tchr 8) Lack of idealist colleagues (Tchr 12) Lack of empathy of administration and teachers (Tchr 14)
	Personal Reasons	Being a perfectionist (Tchr 3) Withdrawing (Tchr 4) Seeing yourself inadequate (Tchr 9, Tchr 14) Inability to be brave (Tchr 10) Being timid, shy (Tchr 14) Inability to stand firm (Tchr 16)
	Reasons Related with University Education	Inadequate university education (Tchr 2, Tchr 9) Mismatch of what is learned in theory and real-life practices (Tchr 3, Tchr 7)
	Inadequate Internship Applications	Inability to have an active learning experience during internships (Tchr 2) Not being able to learn concrete experiences during the internship (Tchr 2)
	Reasons Caused by Inexperience	Being inexperienced (Tchr 7, Tchr 16) Not knowing the process and environment (Tchr 15)
	Reasons Caused by Not Appreciating the Job	Not having an appreciation for the branch and things you do (Tchr 12) Your actions' being seen as unnecessary (Tchr 13) Your actions' being seen as workload (Tchr 13)
	Reasons Related with Limited Opportunities	Limited facilities (Tchr 11) Negative social environmental conditions (Tchr 11)

Table 10 provides suggestions for teachers not to experience reality shocks and to effectively cope with the frustration of this shock. Suggestions are provided for vocational education such as practice-oriented university education and internships, involving interaction, real-life practices, being longer and qualified, and providing experiences in different school types and levels. To stand stable and strong, not to give up, to establish communication and cooperation, to receive self-improvement training, to be productive, to ask questions, to make observations, to be open to different expectations, to adapt to the situation are other suggestions in terms of personal and professional development.

“Communication should be a little better, maybe we couldn't do it because of lack of communication, the better the communication, the better the success and the things to do. I could not have had much contact

with the administration and teachers, I could have had better communication, my alternatives could have been more.” (Tchr 8)

“I advise the new teachers to contact the experienced teachers in the region about the administration of the place to be appointed and prepare themselves for this situation.” (Tchr 1)

“I would advise new teachers to observe, recognize people, students, and not be prejudiced. I would suggest that they try to look more objective and ask questions when there is a problem. When you don't know things, you don't know how to do things right, you get wrong.” (Tchr 15)

“I would recommend the new teachers to stand as they were at the beginning, not to give up, to continue with their own decisions.” (Tchr 4)

Table 10. Suggestions

Theme	Sub Theme	Codes
Suggestions	Communication and Cooperation	Communicating effectively with administration and teachers (Tchr 5, Tchr 8) Cooperation with different institutions and organizations (Tchr 8) Sharing with colleagues (Tchr 14) Asking for help from colleagues (Tchr 16)
	Suggestions about Professional Development Process	Communicating with teachers and administrators at the school appointed (Tchr 1) Multiple internships in different institutions (Tchr 2, Tchr 7) Choosing a different profession (Tchr 6) Appointment to the state (Tchr 6) Previous investigation of the school appointed (Tchr 11, Tchr 12) Academically equipped (Tchr 12, Tchr 14) Not losing excitement (Tchr 13)
	Suggestions about Improving Personal Competencies	Preparing yourself for every situation (Tchr 1) Being open to different expectations (Tchr 2) Getting psychological support when you can't cope (Tchr 3, Tchr 9) Receiving self-improvement training (Tchr 9) Thinking positive (Tchr 9) Increasing knowledge (Tchr 9, Tchr 15) Being productive (Tchr 13) Observation (Tchr 14, Tchr 15) Asking questions (Tchr 15)
	Suggestions about Personal and Professional Posture	Not compromising your profession (Tchr 2) Being decisive (Tchr 4) Not giving up (Tchr 4) Standing strong (Tchr 9) Self-confidence (Tchr 10, Tchr 14) Not submitting to unwritten dictations (Tchr 10) Not being prejudiced (Tchr 15) Getting to know the students (Tchr 15) An authoritarian stance against students (Tchr 16)
	Suggestions about Internship Applications	Standardization of internships (Tchr 2) Internship at different schools and levels (Tchr 3, Tchr 8, Tchr 10, Tchr 16) Experiencing different student profiles (Tchr 3, Tchr 8, Tchr 16) Longer internship period (Tchr 6, Tchr 7, Tchr 11, Tchr 14, Tchr 15, Tchr 16) Qualified internship with predominantly practical aspect (Tchr 6, Tchr 7, Tchr 14, Tchr 15, Tchr 16) More supervised internships (Tchr 14)

Suggestions about University Education	Conducting internships as consultancy activities (Tchr 1, Tchr 13) Training curriculum in accordance with practical situations (Tchr 2, Tchr 7) More applied courses (Tchr 3, Tchr 10, Tchr 12) More communication and interaction based courses (Tchr 3, Tchr 4, Tchr 5, Tchr 10) Applications that will contribute to professional development (Tchr 4, Tchr 11, Tchr 13) Reducing student acceptance (Tchr 6) Accepting to university with an interview (Tchr 12)
--	--

“I suggest that the internship period should be 12 months, not 6 months, but it should be extended. In the third year, all the theoretical courses may be finished and in the last year, only the internship can be applied. In fact, I think the internship should have two stages. Starting from myself, for the high schools, I can say that internship should be done at different levels with different difficulty student profiles. We do internship in groups that are very ready. It should be divided into two, it can be like one school in February, March and another school until June.” (Tchr 16)

“I would suggest that there should be more practical courses and that they should be supervised by someone, not just student-based institutions, but also parent communication. I did not learn in practice and had difficulty. these should also be given importance.” (Tchr 3)

4. Result, Discussion and Conclusion

According to the results of this research, teachers start working with various expectations about administration, colleagues, students, school and environment. Besides, it is seen that they have idealistic attitudes towards the profession and their own. Moir (1999: 19-23) states that teachers are excited and somewhat anxious about their initial teaching experiences at the expectation stage. He states that new teachers have idealistic ideas about how to achieve their goals.

The fact that teachers do not receive support from their administrative staff and colleagues in the schools they work in, their exposure to negative attitudes and behaviors, limited time despite workload, and difficulty in classroom management also pave the way for revealing reality shock (Betts, 2006: cited in Özkan, 2017: 2). When the findings of the study are examined, it is seen that teachers are disappointed with the issues such as administration, colleagues, students, parents, university education and working conditions.

When the findings of the research are examined, it is seen that the teachers who start to work with various expectations show emotional, behavioral and intellectual reactions when some or most of these expectations are not met. In order to cope with this situation, teachers who are disappointed are applying strategies such as getting administrative and colleague support, seeking new jobs, accepting, adapting and withdrawing. As a result of the strategies they apply, situations such as adaptation, self-confidence, positive or negative attitudes are observed in teachers. Dean, Ferris and Konstans (1985) stated that new teachers experience some physical, behavioral and psychological difficulties due to the reality shock they experience and that changes in their behaviors and attitudes are observed. With tension, insomnia, unwillingness, loss of motivation, feelings of burnout, his belief in himself that the teacher will succeed is also damaged. The pleasure of performing his profession decreases and his values and attitudes towards his profession change. In teachers who think that they cannot cope with reality shock, there are also situations such as the decrease in feelings of attachment and feeling of belonging to the school (Dean, Ferris & Konstans, 1985: 5). Some teachers who cannot struggle with the emotions created by reality shock may even quit their profession.

According to the findings of the research, teachers state that reality shock is caused by negative management and colleague attitude, university education and internship practices not being fully replicated in practice and inexperience.

According to the results of the study, in order to avoid the reality shock and to combat the effects of the reality shock, some suggestion such as making university education and internship practices strong and practice-oriented, increasing personal and professional competencies, having communication and cooperation are offered. In this research, how the teachers define reality shock, what effects the reality shock creates in teachers, how the teachers deal with reality shock, who they get support from, the reasons of reality shock and what are the suggestions to deal with the effects of reality shock are comprehensively discussed. It may be suggested that a similar research can be conducted on a single branch by collecting data from teachers working in a specific region. Determining the levels of reality shock of different occupational groups and revealing the effects of reality shock on different occupational groups can be suggested as a research subject.

Abstract

Social entrepreneurship is a process of production of goods/offering services with an aim to solve social problems, rather than gain profit. It plays ever growing role in the contemporary society torn up by inequality, discrimination, social estrangement, etc. The purpose of the current investigation is to research the attitude of the Latvian local municipalities to the social entrepreneurship, to determine main problems and to work out the transformation scheme of the local municipalities, as well as specific proposals in the field. In order to attain these goals the authors have employed both quantitative (survey) and qualitative (semi-structured interviews) methods. The results suggest that 59% of municipalities are ready to support social enterprises, rather than found such themselves, thus opportunities are to be found in the sphere of transformation that includes the decentralization of management functions. In the end the article offers a new model of the local municipalities' management functions in relation to the social entrepreneurship.

Keywords: Social entrepreneurship; local municipalities; management functions; social engagement

Introduction

With the beginning of the second decade of the 21st century, the concept of social entrepreneurship in Latvia has become increasingly topical. It has been fueled by practices in other countries, European Union (EU) initiatives, as well as national problems that the public and private sectors are unable to address by now. Discussions related to social entrepreneurship have taken place in Latvia, applied and scientific researches have been carried out, proposals have been made for the development of social entrepreneurship. The scientific and applied material on social entrepreneurship is relatively large compared to other sectors such as territorial marketing and gives a good idea of the current situation. The most significant works regarding the situation in Latvia are: a research "Latvia on the road to social entrepreneurship" (Lešinska et al., 2012), "The development of social entrepreneurship in Latvia: the role of municipalities" (Lukjanska et al., 2017), and "Social enterprises and their ecosystems in Europe. Country report LATVIA" (Līcīte, 2018). The valuable source of information is the report published by the European Commission, that includes information about Latvia, "A map of social enterprises and their eco-systems in Europe, Country Report". (European Commission, 2014) All of the works mentioned above have been developed with the support of various external financial instruments, which emphasize the interest of forces outside Latvia in the development of social entrepreneurship in Latvia. This indicates that social entrepreneurship in Latvia is driven by external forces rather than developed domestically, so in this context the discussion is not about opportunities and problems of social entrepreneurship development, but rather about adaptation of existing models. The exception is an organization that has been granted the status of a public benefit organization, which is described as the Latvian version of what is commonly understood by the term social enterprise. In Latvia, fast expansion of social entrepreneurship was observed in the period 2013–2017

when the concept of social enterprise was defined and the Social Enterprise Law, which came into force on 1 April 2018, was adopted. The Law defines the concept of social enterprise and the goals of a social enterprise, the procedure of acquiring the status of social enterprise as well as other matters. (Legal Acts of the Republic of Latvia, 2017) A common characteristic feature of the legal frameworks of the Baltic States is that the profits of social enterprises are not distributed among their shareholders but allocated for achieving the social goals of the enterprises. (Sannikova & Brante, 2018)

The social business initiative (SBI), launched in 2011 (European Commission, 2018), aims to introduce a short-term action plan to support the development of social enterprises, key stakeholders in the social economy and social innovation. It also aims to prompt a debate on the avenues to be explored in the medium/long term. There are 11 priority measures, organised around 3 themes:

- Making it easier for social enterprises to obtain funding (this includes the legal regulations);
- Increasing the visibility of social entrepreneurship;
- Making the legal environment friendlier for social enterprises.

At the end of 2015, the “Latvian Social Entrepreneurship Association” was established to unite and support entrepreneurs and other entities who consider themselves to be social entrepreneurs. Pressure on the government was intensified by various forms of public debate. Thus, each the association organizes a forum devoted to current development and problems in the field of social business. The Social Business Forum 2019 was dedicated to business models, because every successful business is based on a thoughtful business model. The main questions were: How to turn an idea and desire to help the world into a successful business? Can Social Entrepreneurship be a profitable business? These are the most pressing issues that challenge social entrepreneurs not only in Latvia, but around the world. (Latvijas sociālās uzņēmējdarbības asociācija, n.a.)

Concept of social entrepreneurship. Social entrepreneurship and the related topics are frequently discussed by academicians, business professionals and authorities (Alvord et al., 2004; Austin et al., 2006; Dacin et al., 2011; Dees & Anderson, 2006; Mair & Noboa, 2006; Seelosa & Mair, 2005; Shina & Titko, 2017). According to some researchers, the social entrepreneurship development is influenced by the three main factors – the demand (public desire for social services/products, as customer or user), the supply (social entrepreneurs) and third – because of the environment and institutional factor that influence the previous two factors. (Sekliuckiene & Kisielius, 2015) Because the concept of social entrepreneurship is broad and involves different policies in different countries, there is no universally accepted definition of social entrepreneurship in the scientific literature (Dobele, 2013). They are either too broad (eg EU common policies) or too narrow (national context). Therefore, universal social entrepreneurship features (objective) or national legal framework (subjective) are used to define social entrepreneurship. When describing social entrepreneurship, three elements can be distinguished: social entrepreneur (subject), social entrepreneurship (process), social enterprise (object). The latter has been discussed more extensively in the literature. By defining the aforementioned elements in a broader context, a social entrepreneur is a socially minded person who, by doing business, solves socio-economic problems and creates positive changes in society (Dobele, 2013). To describe social entrepreneurship as a process, the definition of Yunus is often used. According to him, social business is a financially sustainable organization created only to solve a social problem. Whereas original investments may be recovered, all potential profits are reinvested to further increase the organization’s social impact. A social business has products, services, customers, markets, expenses, and a revenue like a regular business, it is no-loss, no-dividend, self-sustaining company that repays its owners’ investment. It is not a charity, but a business in every sense. The managerial outlook must be the same as in a conventional profit –maximizing business. (Yunus, 2007) Yunus also puts forward several principles of the social business: business objective is to use market mechanisms to address problems which threaten people and society (e.g. education, health, technology access, environment,

etc.); the business is supported by its stakeholders, the business must achieve financial and economic sustainability; investors get back their fair share of investment while the society benefits from positive externalities created by the business; the business is environmentally conscious; workforce gets market wage with better working conditions, and, finally, social business is a joyful exercise. The European Commission uses the term 'social enterprise' to cover the following types of business:

- Those for whom the social or societal objective of the common good is the reason for the commercial activity, often in the form of a high level of social innovation;
- Those whose profits are mainly reinvested to achieve this social objective;
- Those where the method of organisation or the ownership system reflects the enterprise's mission, using democratic or participatory principles or focusing on social justice. (European Commission, 2018)

There are several legal forms of social enterprises. Many social enterprises operate in the form of social cooperatives, some are registered as private companies limited by guarantee, some are mutual, and a lot of them are non-profit-distributing organisations like provident societies, associations, voluntary organisations, charities or foundations. The legal form and organizational structure of the social business organization depends also on the global requirements, such as demographic shifts, liberalization of national economies and attendant markets, institutional and state failures, and technological advances that increase the calls for more social consciousness within businesses, providing the impetus for the formation of social ventures. (Zahra et al., 2008)

Social business environment subjects and their support. The need for political support instruments for social enterprises stems from their ability to compete on the path to economic sustainability, incl. profit as a result of positive action. State or local government support for social enterprises is needed to counterbalance competitive pressure, but at the same time: "Social enterprises need to be aware that the services they provide and the goods they produce must be of high quality and in demand on the market." (Lešinska et al., 2012) There is currently no direct support mechanism for social enterprises in Latvia, they operate under similar conditions as private enterprises. At present, support for social enterprises is obtained on the basis of the specific features of the enterprise concerned, correspondingly to the conditions of according support mechanisms. For example, support for businesses employing people with disabilities, loans to small and medium-sized enterprises, target co-financing, EU grants, information support, etc. The main external source of finance for social enterprises is grants from various organizations. The availability of aid depends on the legal form of the undertaking, the nature and purpose of its operation and the eligibility of the aid. The factors mentioned and their strength subsequently determine whether the social enterprise concerned is in a position to compete for aid with companies that do not consider themselves to be so. Currently the most extensive support for social entrepreneurship in Latvia is the informative one, which is relatively high considering the activities of the last five years. The studies, reports and reports mentioned above, as well as public activities, are relevant in this context.

Experience of local governments in Latvia. Agencies and municipal authorities in Latvia mainly implement state or municipal policies and are distinguished by the centralization of their work - annual budget planning, centralized accounting, decision making, real estate management, etc. things. Both types of organization are not companies, but bodies performing municipal functions whose brain center is one or the other department or division of the municipality. The main difference, and hence the motive behind the establishment, is that the institution has limited capacity to market its products and services, but the agency is allowed to do so. Institutional action is therefore process-oriented, while agencies work for a specific purpose. This circumstance serves as evidence of the lack of entrepreneurial and institutional social activity in institutions. The number of features of social entrepreneurship is greater in agencies and municipal companies. Article 14 (1) of the Law on Local Governments (Legal Acts of the Republic of Latvia, 1994) stipulates that, in the exercise of their

functions, local authorities shall have the right to form municipal authorities, to form associations or foundations, to capital companies and to invest their funds in capital companies. Based on the aforementioned article of the law, the motive for the establishment of institutions is the provision of functions entrusted to the municipality or the state, for which the institution is used as a tool for achieving the objective. The number of institutions is subordinate to the autonomous functions of the municipality. The core of institutions in the municipality is where the responsibilities of the state and the municipality - to provide people with the right to education, health care and social assistance - merge. Such organizations are more complex in the context of social entrepreneurship because of the wider range of stakeholders. They have different requirements and understanding of what is happening in the institution. This means that in the future it will be more difficult or even impossible to manipulate such institutions in the context of social business. For example, Lukjanska and others (2017) have proposed six models of social entrepreneurship support in municipalities:

1. Isolation - a framework in which no relationship is established between the municipality and social entrepreneurs;
2. "Coffee Shop" is a framework where co-operation between the two parties takes place on an informal basis. The framework most often refers to small municipalities where people know each other well and people may have multiple responsibilities within the municipality. This framework is associated with a high level of mutual understanding, less formal policies are pursued;
3. Partnership - within the framework, both parties benefit from each of the knowledge, competences and resources that are pooled to achieve a common goal;
4. Linking - denotes a partnership between both sides to gain access to external resources;
5. Internal integration - based on an effective internal, interdepartmental coordination system that supports collaboration with both the social economy and other sectors;
6. How can we help? - describes the form of partnership in which; "The municipality responds to requests from social economy network". (Lukjanska and others, 2017)

Prior to explication of the methodology and results of the empirical research, it is necessary to specify the use of some theoretical concepts. *Social support* is defined as the circle of family, friends, neighbors and community members who are able to provide psychological, physical or financial help when needed. There are different forms of social support. The most popular forms of support include individual health restrictions (home care, dysfunction, disability, illness unemployment), high risk and stress (crisis centers, shelters, specialized workshops) and factors of quality of life in order to function well in society (benefits and types, social services). *Social exclusion* represents a wider form of poverty. The European Commission defines poor people as people whose various incomes, as a whole, are incapable of providing basic values and are forced to live below the standard of living in society. In general, poor people are unable to provide themselves with essential basic needs such as food, independent living, health, education, culture. (Atkinson & Davoudi, 2000) *Human resource development and management* is defined as a sequential and strategic approach to managing working resources to achieve organizational or community goals. The concept of human resource development is generally applied to a set of actions based on a concerted decision. Such activities lead to the achievement of the organisation's objectives and to the more effective recruitment, deployment, utilization, development and remuneration of human resources. There are also formal and informal forms of internal (within a company or group) and external (publicly available) development. (Armstrong, 2006)

Research Questions of the current investigation are the following:

RQ1: What are the main problems local municipalities (governments) face regarding social eneterpreneurship?

RQ2: What are possible problem solutions?

Method

To investigate the engagement of Latvian local municipalities in social entrepreneurship the mixed research design was chosen – the formalized survey of the municipalities (the quantitative approach), and the semi-structured interviews with the local government leaders, as well as businessmen involved in the social entrepreneurship (the qualitative approach). The proposed administration of the survey was throughout the Internet, the link was sent to the local governments, members of the network of the association of local governments of Latvia. The method of pilot testing was adopted prior to distributing the questionnaire to all prospective respondents, i.e., it was sent first to three local governments, the ones of the Daugavpils, Krāslava and Rēzekne regions. After their feedback, the number of questions was reduced to 24, and some statements were rephrased to obtain better and clearer wording. In the result, the questionnaire consisted of 24 statements, divided in two groups. The first group (7 questions) part regarded problems the local governments faced and resource availability, while the second part (17 questions) was aimed at disclosing the social function delegation problems their solving possibilities. As to the responses received: the questions in the first part were answered by 49 local governments, while the second part received 35 responses. As this research paper investigates attitudes and beliefs the 5-point Likert scale was used for the questionnaire. The data was collected using a non-probability sample procedure.

On the basis of the prior research and the pilot testing, five main problem groups were delineated by the authors of the current investigation. The respondents were asked to rank them according to their significance for the local municipalities (1=not important, 5=very important). The statements for evaluation were the following:

- Problems of involvement of socially supported (e.g. unemployed);
- Problems of involvement of socially excluded (e.g. ethnic groups);
- Problems of social function delegation by local governments;
- Problems of human resource development;
- Problems of territory improvement.

Then the same statements were used to rank the problems in accordance to resource availability, in general, then each statement was expanded further on to include such parameters as: collaboration partners, human resources, financial resources, appropriate infrastructure.

The second part of the questionnaire (17 questions) was related to problems of delegation of social functions and problem solution possibilities involving the public and private sector subjects. The respondents were asked to evaluate using the 5-point Likert scale the statements regarding position taken by the local government in relation to developing the social entrepreneurship where 1 stands for the passive position (supporting private initiatives in establishing social enterprises), and 5 for the active one (establishing social enterprises themselves). The next portion of questions were devoted to the problem solution variants of the fore-mentioned problems (i.e., involvement of socially supported, involvement of socially excluded, human resource development, territory improvement). The proposed problem solution variants for the local governments to be evaluated according to 5-point Likert scale (1=not important; 5=very important), were the following:

- Take a liberal stand – in the situation of appropriate business environment, ensured by national and local governments, problems will be solved by free market;
- Collaborate and actively support newly established or transformed private social enterprises. Which ones? (the answer place in the square “enterprise”);
- Collaborate and actively support NGOs involved in social entrepreneurship. Which ones? (the answer place in the square “enterprise”);

- Transform local a government agency, company, corporation into a social enterprise. Which ones? (the answer place in the square “enterprise”);
- Establish a new social enterprise under the aegis of local government.

The second part of questionnaire concerned the function delegation practices in collaboration with actors of the private sector at present (private corporations; private corporations where part of shares belong to local governments; NGOs) and in future (private corporations; private corporations where part of shares belong to local governments; NGOs and social enterprises founded by them; social enterprises; hybrid enterprises). The qualitative approach was applied in the form of semi-structured interviews with chief officers of the local governments as well company managers involved in the process. The interviews were carried out to have a deeper insight into and to conceptualize problems the local governments face, altogether 12 respondents were interviewed. The results were analyzed by the means of the inductive content analysis. The process of analysis involves three main phases: preparation, organization, and reporting of results. (Schreier, 2012) Within the current research the preparation consisted of the choice of collection method (semi-structured interviews) and survey sample (representatives of the local governments and socially oriented businesses). The organization phase consisted of the choice of interpretation units (perception of the social entrepreneurship, in general and definition of main problems), while the reporting phase was executed in the article at hand.

Findings

The tasks of this study were to evaluate the possibilities of using social entrepreneurship for the involvement of the socially supported, the inclusion of the marginalized, the delegation of municipal functions, the development of human resources and the improvement of the territory. In the course of the research, local governments were asked about the topicality and significance of the mentioned problems, indicating those areas where a solution would be most needed (see Table 1).

Table 1. Topicality of problems in local municipalities (n=35)

Problem	Topicality
Engagement of socially supported	49%
Human resource development	29%
Delegation of municipal functions	11%
Improvement of territory	11%

The low importance of the problem of territory improvement is due to the relatively successful operation of municipal, including private (especially waste management) limited companies, which satisfies both the inhabitants and the local municipalities, which are more important than the apparent efficiency and progress promised. private sector, but modesty and a great deal of stability guaranteed by the local government. Thus, the problems of territory development in the context of social entrepreneurship should be discussed about the possibilities to improve the operation of the existing municipal capital companies and the niches where these companies are unable to provide a solution.

The analysis of the significance of the problem was carried out in two steps. First, the results of the questionnaires are analyzed by comparing the values of the answers to different questions. Secondly, the results of the questionnaires are analyzed together with statistics obtained from local government budgets using the Treasury database and data tables available at the Central Statistical Bureau. The most important problems in the local governments' answers are “Problems of involvement of socially excluded people” and “Problems of human

resource development". 31 municipalities attach great or very high importance to the "Engagement of socially supported" and 30 Municipalities to the "Human resource development problems". This means that more than 60% of the municipalities that responded to the questionnaire are of the utmost importance (see Table 2).

Table 2. Significance of problems within local municipalities (n=49)

Problem	Topicality
Engagement of socially supported	24%
Human resource development	22%
Delegation of municipal functions	19%
Improvement of territory	19%
Engagement of socially excluded	16%

When analyzing resources for problem solving, most municipalities have noted that none of the problems to be solved are marked by a significant lack of resources. More than half of the municipalities have indicated that there is a moderate or minor lack of resources to address the problems. As a result, the average assessment of resource scarcity is 3 (Table 3), which means that municipalities generally have access to an average amount of resources.

Table 3. Average estimate (mean) of resource availability and problem significance (n=35)

Problem	Resource availability	Problem significance
Engagement of socially supported	3,1	3,8
Human resource development	3,0	3,6
Delegation of municipal functions	3,0	3,0
Improvement of territory	3,0	3,1
Engagement of socially excluded	3,0	2,7

The replies indicate that social observations are involved in society and they are involved in society, but also in society, in development, in welfare and in social development. Consequently, visa issues will be addressed in further research sections as energy resources are inadequately available.

Municipalities were invited to assess the lack of key resources to address the problems identified (see Tables, 1 & 2). Taking into account the diversity of problems, four key resources for solving different problems, which depend on the internal organization of local governments and the influence of external factors, were offered. These resources are:

1. Adequate infrastructure that is an integral part of a problem or supports a specific problem. For example, equipped facilities for training;
2. The financial resources needed both for investment projects to solve the problem and to cover daily expenses;

3. The human resources needed to plan ways to solve the problem, ensure implementation of problem-solving plans, and measure progress in solving the problem;
4. Collaboration partners that provide goods and services for problem solving in situations where municipalities themselves do not have the capacity or knowledge to produce the necessary goods and services.

Fundraising is a complex process and building the appropriate infrastructure is in most cases a capital intensive process. This means that if social enterprises were to address these two municipalities' problems, they would have to be able to raise funding and use it more efficiently than municipalities are currently able to do. With traditional capital market mechanisms, social enterprises would not be able to do this better than municipalities, since from the investor's point of view, social enterprises have a significantly higher risk in the start-up phase than municipalities. However, social enterprises could use new instruments that have only recently emerged in the global capital market, such as social impact bonds or managers in socially responsible investing. Problems related to social inclusion are generally the least urgent among the municipalities surveyed. This is not in line with the common challenges in the European Union, where, for example, the immigrant crisis has become one of the main challenges. In general, social enterprises may be partners in solving this problem, but the responses of local governments indicate that addressing socially excluded inclusion issues is not the highest priority in Latvian municipalities. From the municipality's point of view, similar resource allocation challenges can also be observed in solving socially supported engagement problems. The problem of the involvement of the socially supported is more important than the problem of the inclusion of the socially excluded in Latvian municipalities. Using the correlation method, the results of the answers were evaluated according to various variables characterizing the development of the municipality and the budget lines of the municipality. The analysis of the study included a correlation analysis of the responses (see Table 4).

Table 4. Summary of correlation coefficients

Variables	Problem	Coefficient
Expenditure on social protection per capita	Engagement of socially supported	- 0,01
Expenditure on social protection per capita	Engagement of socially excluded	- 0,06
Changes in the number of legal entities	Delegation of municipal functions	- 0,01
Expenditure on education per capita	Human resource development	- 0,00
Expenditure on land and housing management per capita	Improvement of territory	- 0,21

The authors compared the municipal budgets with the municipalities' own responses to the questionnaire on the availability of resources to address specific problems, and observed that the reliability of the questionnaire responses was high. There are no significant anomalies in the responses to the municipal questionnaire. For example, it is generally not possible to observe cases where municipalities with relatively high development and availability of resources indicate a significant lack of resources. In general, the correlation analysis indicates a weak link between municipal characteristics and municipal responses to the question regarding funding. Negative signs at the coefficients indicate that the link is working in the "right" direction, that is, as the volume of the resource / variable increases, there is a reduction in the resource gap mentioned in the heading of the questionnaire. The strongest link is between the expenditure on land and housing management and the municipality's assessment of the availability of resources for territory improvement problems.

The qualitative method consisted of visiting municipalities, conducting on-the-spot study of the situation and interviewing in a semi structured way the municipal executives and the heads of the institutions competent for the implementation of the problems to be solved in this work. The method is used to better understand, conceptualize and interpret problems at work and to be able to offer appropriate solutions. The range of questions asked to the municipalities was designed to cover the problems and to identify their causes.

Results, Conclusions and Recommendations

Due to the problems of understanding social entrepreneurship, associating it with social services, the center of gravity of the formation of new social enterprises in municipalities could be related to the clients of social services and their employment. Responsibility for the implementation of the projects will be demanded from service managers, who currently, due to their limited ability to deliver the organization's primary functions, do not yet see opportunities to undertake social entrepreneurship initiatives.

1. Local governments in Latvia (59%) would be more willing to support the development of private social enterprises than to establish them themselves (41%). This is why local governments are more likely to transform existing organizations than to set up new social enterprises. In the case of municipal corporations, transformation will be impeded not by objective but by subjective barriers, since heat, water, utilities and spatial planning in municipalities are called "fundamental sectors" that would be difficult for their management to associate with the term social entrepreneurship. Therefore, the services that are in the middle between those offered by the municipal corporation and the authorities will first be transformed. In the municipal government and agency sector, the role of social entrepreneurship is due to: a) Transformation which, by mitigating the impact of the centralization factor, would increase own revenues and reduce their need for municipal funding. Before doing so, you should measure the amount of co-financing that a social enterprise will require from the municipality; (b) not transforming an institution but setting up a new social enterprise which takes over the functions of an institution with market opportunities and business methods. A tandem is emerging where the institution is acting as a municipality, but the company is helping it to make the most of its resources.

2. In the early stages of social entrepreneurship, the niche for establishing new municipal social enterprises can be described as "interdisciplinary", where strategic industries and municipal functions that are well-executed by organizations and NGOs working at municipal level collide. Therefore, the social enterprise niche in Latvia should start where administrative methods are exhausted and end where commercial profitability begins, leaving this niche to hybrid companies and entrepreneurs.

3. With its material and administrative resources, a municipality is strong in starting a business, but weak in generating and managing new business ideas, as the main motive for starting a social enterprise in a municipality will stem from municipal policy where creativity and efficiency are not decisive. A municipality will only establish a social enterprise if it is found that the problem is chronic and it is determined that the operation of the private social enterprise creates more problems than good for the municipality and concludes that for the consumer stability is more important than efficiency.

4. The problem of delegation of functions is the main contradiction of this study. Municipalities would be reluctant to set up new social enterprises, but would not be willing to delegate their functions to the private sector. This is circumstantial evidence that social entrepreneurship is actually happening in Latvia, but it is contradictory by its nature, this entails some negative consequences.

5. The problem of involvement of the socially supported in municipalities is the most urgent (49% of municipalities believe), followed by human resource development problems (29%), especially in the regions. Area improvement problems are less urgent (11%). More than 80% of municipalities have indicated that there

are insufficient resources to solve the problems mentioned. This means that in the area of social and public services there is room for additional service providers - social enterprises founded by the private sector.

6. Regarding human resource development, municipal social enterprises would also be reluctant to support the private sector. Social business opportunities are linked to the education sector, where, in tandem, a municipal authority and a private social enterprise would be expected to diversify the municipal service and optimize the use of institutional resources. The second segment of potential development in the field of human resource development is the promotion of entrepreneurship and the promotion of the return of people, where the interests of the municipality and the local businesses collide. Currently, co-financing of student and start-up companies, as well as support for attracting priority professions, is the most common practice.

7. It is advisable for municipal management to look at social entrepreneurship opportunities in a broader, societal context, not just in the context of social services. This will make it possible to assess the role of different entities, municipal and private, in social entrepreneurship and how to support them. It is particularly advisable to evaluate the hybrid business practices and opportunities of a particular municipality, as this issue is poorly studied in Latvia.

8. In the future, when municipalities set up social enterprises, it is advisable to use them not only as a tool for policy implementation, but also as a way of driving innovation within the municipality to solve the existing problems. This would be facilitated by a more active involvement of private sector social enterprises in supporting those individuals who are already pursuing a social mission, driven by personal calling, in parallel with commercial activities. In order to stimulate such entrepreneurs, municipalities are advised not to confine themselves to procurement contracts but to use more efficient forms of delegation of municipal functions.

Abstract

The objective of the present paper is to analyse the factor of learning approaches in the context of selected demographic characteristics in university students. The research sample consisted of 710 students (mean age = 22.61, SD = 4.173, range 19-55 years) of whom 116 were male and 594 were female. Data collection was performed by means of the Revised Two Factor Study Process Questionnaire (R-SPQ-2F). In the context of gender, the results suggested that men and women differed in the choice of surface approach ($p = .005$, men have a higher score), in the context of the form of study (full-time vs. part-time) where significant differences were observed in the deep approach learning style ($p = .021$, part-time students have a higher score); in the context of the type of study (teaching vs. non-teaching courses) where students of non-teaching courses had a higher score in deep motive ($p = .017$).

Keywords: university student, learning approaches, learning, teacher

Introduction

In the context of learning, there are many concepts that try to define the ways people learn. In this respect, frequent terms are learning styles and learning processes or learning approaches. Although it may seem that these terms are identical, it would be a mistake to confuse them. The concept of “learning style” generally expresses an individual way of learning. According to the Dictionary of Education (Průcha, Walterová, Mareš, 2001), learning styles are procedures in learning used by individuals at a specific stage of life in most situations of an educational type (Favre, 2007b). Mareš (1998, 2013) defines learning styles as procedures in learning that individuals prefer in a given period. These are procedures that are distinctive in their focus, motivation, structure, sequence, depth, comprehensiveness, and flexibility. Another concept – learning strategies – encompasses the selection of a specific plan undertaken by a student (Witkin, Moore, Goodenough, 1977; Tremblay, Maclean, 2013). Learning approaches can be defined as a philosophical concept and also as the didactic method of teaching and learning strategies. This includes the learning objectives that comprise furthering knowledge, repetition and reconstruction, application, understanding, observation from a different perspective etc. (Dart, Burnett, Purdie, Boulton-Lewis, Campbell, & Smith, 2000). In a simplified way, learning approaches comprise of a motive and an appropriate strategy (Biggs, 1987a). Although it is necessary to distinguish between the two constructs, there is a link between them because learning approaches are associated with and affected by learning strengths, also known as learning styles. The concept of learning strengths has various definitions that attempt to

show the complexity of examining the learning process (Swanson, 1995), but in principle, all definitions focus on the fundamental question of how a person learns.

Mareš (1998), Biggs, (1999), or Kember (2000) classify learning approaches to surface, deep, and strategic approaches. The surface learning approach is typically used by students who do not enjoy learning. They learn because they have to and because they want to get over it as soon as possible. Therefore, they try to learn texts by heart. The result of this type of learning is little or no understanding of the learning content, and what is learned is soon forgotten. As far as the deep learning approach is concerned, students long for new knowledge, they like learning and are interested in the learning content. Their learning is dominated by intrinsic motivation, they try to understand the learning content and remember it well. The strategic learning approach means that students try to achieve the best possible marks, are competitive, try to be cunning, but basically they are not interested in the learning content. This is a rather performance-oriented approach. Students learn according to the requirements of the teacher who tests them. This means that if the teacher is benevolent, students tend to use the surface learning approach, while a stringent teacher makes them use the deep learning approach. According to Biggs (1999), the most successful students are those who combine the deep and performance-oriented (strategic) approach. These students are highly motivated and capable of efficient use of planning strategies. The least successful students are those with low motivation, who are inclined to the surface approach. The selection of a specific learning approach depends on the specific learning content. A single student may approach various tasks in various ways. A good teacher should respect students' individual learning needs, but absolute adaptation could be counter-productive and need not encourage students (Oluremi, 2015).

Biggs, Kember, & Leung (2001) offer a measurement tool designed to map the last two learning approaches mentioned above. The original version of this measurement tool (Study Process Questionnaire-SPQ) (Biggs, 1987a, 1987b) was designed in 1970s. Since then the nature of education has changed with respect to factors such as heterogeneity of the student population, structure, institutional administration, extent and depth of learning, etc. The main reason for the redevelopment of this measurement tool was the need to update information relating to an analysis of the study environment and an increase in educational quality. The teacher assumes responsibility for teaching and is supposed to support deep approaches to education. The advantage of the method is that it can also be used by teachers to evaluate their own teaching and their students' approaches to learning.

Current beliefs are that each individual has their own style of acquiring new knowledge and learning that affects their thinking, behaviour, attitude to learning, and ways in which they process information. The knowledge about learning approaches is crucial in the academic environment (and especially for future teachers and other professionals in this area) and therefore it is desirable to monitor and analyse the ways that learning approaches develop and change and which variables affect them.

Methodology

The aim of the study was to analyse individual domains of learning approaches and whether these domains were somehow affected by demographic characteristics of university students.

Research questions

- What are the differences in the preference of learning approaches in relation to gender?
- What are the differences in the preference of learning approaches in relation to form of study (full-time vs. part-time)?
- What are the differences in the preference of learning approaches in relation to type of study (teaching vs. non-teaching courses)?
- What are the correlations between learning approaches and students' age?

- What are the differences in the preferences of learning approaches in relation to various grades?
- What are the differences in the preference of learning approaches in relation to students' special educational needs?

Research sample

The research sample consisted of 710 university students (mean age = 22.61, SD = 4.173, range 19-55 years) of whom 116 were male (mean age = 23.34, SD = 3.578, range = 19-42 years) and 594 were female (mean age = 22.47, SD = 4.268, range = 19-55 years). Detailed characteristics of the research sample are shown in Tables 1 and 2.

Table 1. Numbers of respondents by year of study

Year of study	Frequency	%	Cumulat. %
1.	219	30,8	30,8
2.	239	33,7	64,5
3.	8	1,1	65,6
4. / 1. post Bachelor	222	31,3	96,9
5. / 2. post Bachelor	22	3,1	100
Total	710	100	

Table 2. Numbers of respondents by other study characteristics

	Frequency	%	Cumulat. %
Form of study			
full-time	631	88,9	88,9
part-time	79	11,1	100,0
Type of study			
teaching ¹	622	87,6	87,6
non teaching	88	12,4	100,0
Spec. educ. needs			
no	693	97,6	97,6
yes	17	2,4	100,0

The study was conducted in compliance with applicable ethical principles. The research study involved university students on a voluntary basis; the participants were informed about a possibility to terminate their participation at any stage of the research without giving a reason. The participants consented to anonymous data processing and use of data for scientific purposes.

Research methods

The Revised Two Factor Study Process Questionnaire (R-SPQ-2F; Biggs, Kember, & Leung, 2001) is a 20-item questionnaire designed to assess students' approaches to learning through 4 subscales: Deep Motive, Deep Strategy, Surface Motive and Surface Strategy, and 2 higher order factors: Deep Approach and Surface Approach. The current version of the questionnaire has very good psychometric properties. The questionnaire reliability is of an acceptable level: $\omega = 0.73$ for deep approach and $\omega = 0.64$ for surface approach.

¹ Teacher training courses (preschool teachers, primary school teachers, lower secondary school teachers, secondary school teachers), non-teaching disciplines (e.g. speech-language pathology, special preschool education, dramatherapy, mentoring, social work, etc.).

Statistical procedures applied: The data were analysed in SPSS 21 using descriptive statistics calculation, t-test, Mann-Whitney U test, correlation analysis, and ANOVA. The assumptions were verified in advance.

Findings

Means and standard deviations for the scales are shown in Table 3.

Table 3. Průměry, směrodatné odchylky a reliabilita pro dimenze učebních stylů

Table 4. t-test of the differences in learning approaches in relation to gender

	t	df	p	Mean Diff.	SE Diff.	95% CI	
						Lower	Upper
Deep Motive	-0,494	147	,622	-,202	,409	-1,010	,606
Deep Strategy	-0,060	708	,952	-,022	,364	-,736	,692
Surface Motive	3,453	146	,001	1,449	,420	,620	2,279
Surface Strategy	1,907	148	,058	,816	,428	-,030	1,661
Deep Approach	-,298	147,954	,766	-,224	,752	-1,709	1,261
Surface Approach	2,852	146,396	,005	2,265	,794	,696	3,834

In the context of gender, the results suggested differences between men and women in the preferences of learning approaches, specifically in the selection of surface approach ($p = .005$, men have a higher score), subdimension surface motive ($p = .001$, men have a higher score) (see Tab. 4).

Table 5. t- test of the differences in learning approaches in relation to form of study

	t	df	p	Mean Diff.	SE Diff.	95% CI	
						Lower	Upper
Deep Motive	-1,926	708	,055	-,814	,422	-1,643	,016
Deep Strategy	-2,327	708	,020	-,991	,426	-1,828	-,155
Surface Motive	-,099	708	,921	-,043	,436	-,899	,812
Surface Strategy	1,243	708	,214	,555	,447	-,322	1,432
Deep Approach	-2,313	708,000	,021	-1,805	,780	-3,337	-,273
Surface Approach	0,624	708,000	,533	,512	,821	-1,100	2,124

In terms of form of study (full-time vs. part-time), significant differences were observed in the preferences of learning approaches, specifically deep approach ($p = .021$, part-time students have a higher score), subdimension deep strategy ($p = .020$, part-time students have a higher score) (see Tab. 5).

Table 6. t-test of the differences in learning approaches in relation to type of study

	t	df	p	Mean Diff.	SE Diff.	95% CI	
						Lower	Upper
Deep Motive	-2,389	708	,017	-,962	,403	-1,752	-,172
Deep Strategy	-1,570	708	,117	-,640	,407	-1,440	,160
Surface Motive	1,834	708	,067	,761	,415	-,053	1,575
Surface Strategy	2,773	708	,006	1,177	,424	,344	2,010
Deep Approach	-2,149	708,000	,032	-1,602	,745	-3,065	-,139
Surface Approach	2,483	708,000	,013	1,938	,780	,406	3,470

In the context of type of study (teaching vs. non-teaching courses), more significant differences were observed (see Tab. 6). In terms of deep approach ($p = .032$) students of non-teaching courses had a higher score in deep motive ($p = .017$). In terms of the surface approach ($p = .013$) students of teaching courses had a higher score in surface strategy ($p = .006$).

Table 7. Correlation analysis of the relationship between learning approach and age

	1	2	3	4	5	6
Age	,136**	,107**	-,013	-,066	,132**	-,043

* significant at a level of $\alpha = .05$

Note: 1: Deep Motive, 2: Deep Strategy, 3: Surface Motive, 4: Surface Strategy, 5: Deep Approach, 6: Surface Approach

The results of the Pearson correlation analysis suggested a significant correlation between age and deep motive ($r = .136$, $r^2 = .018$, $p < .001$), deep strategy ($r = .107$, $r^2 = .011$, $p = .004$) and deep approach in general ($r = .132$, $r^2 = .017$, $p < .001$). This is a positive correlation, i.e. the preference of deep learning increases with age (see Tab. 7).

Table 8. ANOVA test of differences in learning approaches in the context of grades

	F	df	p
Deep Motive	1,886	4, 705	,111
Deep Strategy	1,5271,503	4, 705	,199
Surface Motive	,0752,625	4, 705	,034
Surface Strategy	5,1452,029	4, 705	,089
Deep Approach	,7081,741	4, 705	,139
Surface Approach	5,1862,604	4, 705	,035

An analysis of the differences in the preferences of learning approaches in the context of grades suggested that students from various grades significantly differed only in one approach and one of its subdimensions (see Tab. 8). Specifically, the difference is in surface approach ($p = .035$) in the dimension of surface motive ($p = .034$). A significant difference is always between grade 1 and 2 ($p = .012$ and $.014$), where first graders achieve a significantly lower score. No significant differences were observed between other grades in the context of these learning approaches or other learning approaches.

Table 9. Mann-Whitney U test rozdílu v učebním stylu ve vztahu k speciálním pedagogickým potřebám

	U	Z	p
Deep Motive	4293,000	-1,919	,055
Deep Strategy	4854,500	-1,245	,213

Surface Motive	4705,500	-1,424	,154
Surface Strategy	5605,000	-,343	,732
Deep Approach	4484,500	-1,685	,092
Surface Approach	5097,500	-,950	,342

Finally, an analysis of the differences in the context of students' special educational needs did not suggest any differences in the preferences of learning approaches (see Tab. 9).

Results, Conclusions and Recommendations

Learning approaches affect the way students learn and approach learning situations. Understanding students' learning approaches is important in trying to increase learning effectiveness and academic achievement (Hogan, Parker, Wiener, Watters, Wood, Oke, 2010). The objective of the present study was to investigate learning approaches among university students with respect to selected demographic data.

For teachers, the basic principle of recognizing learning approaches in students is to perform a detailed analysis of their own learning approaches (strengths and weaknesses) and ways they transfer their own learning styles into the group they teach. The significance of this statement is supported by the selection of the sample of respondents in the present research. This was a future socio-professional group of teachers – students of faculties of education. The ability to recognize various learning approaches in students and to better understand oneself and colleagues is very valuable for teachers. As a result of this ability, teachers should be able to teach all types of learners including those who have difficulty learning and experience problems with emotions and behaviour, and should be able to help them and adjust teaching to their learning approaches. Teachers try to present the learning content in a way that best suits their students' strengths (Riding, Rayner, 1998). This leads to increased academic performance and better attitudes to the educational institution (Lovelace, 2005). The development of a learning approach requires acknowledgement of the need for various strategies that complement individual differences. As a result, teachers exert joint effort to eradicate the universal approach and acknowledge the need for the adjustment of (inter alia) classroom physical factors, instruction procedures, and assessment (Favre, 2007a, Favre, 2007b, Fine, 2003). The parties involved in education agree that these adjustments are a prerequisite to academic achievement. In principle, textbooks and study materials gradually change from analytical, auditory and visual to a more global, kinaesthetic and tactile form of learning (Fin, 2003).

Following the above, several research questions were formulated. The first question related to the differences in the preferences of learning approaches in relation to gender. In the context of gender, the results suggested differences between men and women in the preferences of learning approaches, specifically in the selection of surface approach with men having a higher score in the subdimension of surface motive. This result is not surprising because boys (future men) are known for using the surface approach already in earlier developmental periods (during compulsory education). On the other hand, the conclusions by Janošová (2008) suggest that the current school environment tends to support those requirements that are favoured by girls. This could be one of the causes that clarifies a more superficial learning approach of male students (as opposed to female students). Similar findings were reported by Amir, Jelas, Rahman (2011), who investigated the learning approaches of students of various fields of study. Male students showed greater tendencies to independence, evasive behaviour and surface learning approach, while female students were shown to be more participatory. Similarly, in their study Hoffmann, Stover, Uriel and Liporace (2015) confirmed the pragmatic approach among men and younger students.

The second research question related to the differences in the preferences of learning approaches in relation to form of study (full-time vs. part-time). As far as form of study is concerned, significant differences were observed in the preferences of deep approach in part-time students (as opposed to full-time students), specifically in the deep strategy subdimension. According to Biggs (1999), this type of strategy is typically used by more

successful students. According to the author, academic achievement is strengthened when students combine the deep and performance-oriented (strategic) approach. These students are highly motivated and capable of efficient use of planning strategies. In the case of part-time students this approach is obvious. These are mostly students in higher grades who are careful about their time and energy. They usually have a job and family responsibilities and need to pass their exams at the first attempt. Therefore, they tend to be more responsible in their attitude to learning and tend to use a more reliable learning approach.

The third research question related to the differences in the preferences of learning approaches in relation to type of study (teaching vs. non-teaching courses). In the context of these variables, students of non-teaching courses had a higher score in deep approach and a higher score in deep motive. In terms of surface approach students of teaching courses had a higher score in surface strategy. This is not a positive result for the sample of future teachers. In this sense, it is desirable to analyse the suitability or need of teacher counselling.

The fourth question related to the correlation between learning approaches and students' age. The results suggested a significant correlation between age and deep motive, deep strategy and deep approach in general. It has been confirmed that the preference of deep learning increases with age. According to Mareš (1998), Biggs, (1999), Kember (2000) the deep learning approach motivates students to find out new knowledge, they like learning and are interested in the learning content. Their learning is dominated by intrinsic motivation, they try to understand the learning content and remember it well. It could be speculated that this is a responsible approach to study leading to improved academic achievement. This is usually typical of individuals who are mature in terms of personality development and achieve their own identity (i.e. need for personal and social meaning) (Langmeier, Matějček, 1974; Macek, 2003) and postconventional morality (Kohlberg, Hersh 1977). This conclusion is consistent with the results of preferences of learning approaches in relation to form of study (full-time vs. part-time, see research question two above).

The fifth research question related to the differences in the preferences of learning approaches in relation to various grades. An analysis of the differences in the preferences of learning approaches in the context of grades suggested that students from various grades significantly differed only in one approach and one of its subdimensions, specifically the surface motive dimension. A significant difference is always between grade 1 and 2, where first graders achieve a significantly lower score. No significant differences were observed between other grades in the context of these learning approaches or other learning approaches. These findings are somewhat surprising concerning the fact that first graders are newcomers. They have no experience with university study and usually take it seriously. They try to meet their requirements and understand the system. Empirical research findings correspond with some attitudes and learning approaches of students in higher grades who have already become accustomed to the system and tend to select the surface learning approach because they want to get over their study as quickly as possible (Mareš, 1998; Biggs, 1999, Kember, Wong, 2000).

The sixth and final question examined the differences in the preferences of learning approaches in relation to students' special educational needs. This is an additional finding because the number of these students in the research sample is low and the results cannot be generalized. The interpretation of this result can be considered a possible research direction in the future. An analysis of the differences in the context of students' special educational needs did not suggest any differences in the preferences of learning approaches. Current universities and especially faculties of education are open to students with special educational needs. For these students, psychological and special educational counselling centres are provided, in which these students have an opportunity to consult their needs with professionals (university teachers). Also in this case, the implications of these findings are discussed in terms of teaching and learning in universities in ways that correspond with various needs and study approaches of students with special educational needs in order to improve their learning, support lifelong learning, and strengthen their chances on the labour market.

The learning approach is a style that people choose when they learn something new. The way that people learn and process new information is one of the many factors that make each individual unique. After some time of using these strategies it can be anticipated that students know which educational strategies to use to resolve their problems. As a result, they will be able to accept responsibility for the impacts of their teaching (see also Oluremi, 2015). Teachers should be able to help students reveal their own educational preferences and provide constructive feedback on the advantages and disadvantages of various approaches. Research studies aimed at preferences of learning approaches are crucial in terms of helping students understand their own study approaches in order for them to use their strengths in an effective way.

Abstract

The present paper focuses on an analysis of academic motivation among university students in the context of demographic and study variables (type of study, form of study). The research sample consisted of 710 university students (mean age = 22.61, SD = 4.173, range 19-55 years) of whom 116 were male and 594 were female. The data were obtained by means of the Academic Motivation Scale (AMSC-28, Vallerand, et al., 1992). The results of the survey suggest statistically significant differences in the context of gender and age. There are significant differences between men and women in the following dimensions Intrinsic motivation – to know (women have a higher score), Extrinsic motivation – identified (women have a higher score), and amotivation (men have a higher score). In relation to age, the results of the Pearson correlation analysis confirmed a significant correlation between extrinsic motivation – identified and extrinsic motivation – external regulation, which decrease with age.

Keywords: motivation, academic motivation, students

Introduction

The concept of motivation is investigated in various scientific disciplines and primarily focuses on an analysis of “what and why” people do (Deci, Ryan, 2000). Motivation is primarily described as a process that determines the focus of an individual on achieving specific objectives, its intensity and duration. Many research studies focus on performance motivation, which is considered a substantial performance determinant. In the context of performance motivation, the need for high performance is considered central by many authors (Atkinson, Feather, 1966). Various types of motivation are generally regarded as factors affecting the level of performance and the way students learn (Ormond, 2003). Setting the performance may then affect academic motivation, which is often considered motivation for learning and motivation for study. Academic motivation as an integral part of university study and deals with psychological processes that lead to learning and the reasons why people study (Murtonen, Olkinuora, Tynjälä, Lehtinen 2008; Paulsen, Feldman, 2005). It is examined from many theoretical views and perspectives. In terms of academic motivation, the authors of the self-determination theory (SDT) Deci and Ryan (2008) primarily distinguish between two basic types of motivation: intrinsic and extrinsic. Intrinsic motivation means that a person performs an activity for the sake of the activity itself because it is interesting and satisfying. Extrinsic motivation refers to involvement in activities, where certain, especially external, consequences are expected (reward or punishment). However, these two types of motivation do not work in synergy. It was observed that behaviour motivated from the outside decreased the level of intrinsic motivation irrespective of age, activity or reward (Deci, Koestner, Ryan, 1999). The concepts of intrinsic and extrinsic motivation appeared in psychology more than forty years ago (Nakonečný, 2015). The boundaries between these types of motivation are unclear and some types of activities may include both types. Extrinsic

motivation is important for students who do not consider their study as entertaining or interesting. In the context of motivation, correlating variables are often values, objectives, self-efficacy in the sense of personal conviction of an individual about one's abilities, and attribution tendency. Academic motivation is then the result of the factors mentioned above and personality dispositions of the individual. The importance of academic motivation is further strengthened by the repeatedly confirmed significant positive association between academic motivation and academic achievement (Wentzel, 1999). It has been shown that a student with high academic motivation has a desire to learn, which leads to success and recognizing that learning is beneficial (Brown, 2009). The assumption that people are naturally curious and have a natural interest in learning is the basis of the already mentioned self-determination theory (Deci, Ryan, 2000).

A measurement scale for assessing academic motivation in relation to the self-determination theory was designed by Vallerand, Pelletier, Blais, Brière, Senécal and Vallières (1992). The scale includes a total of 28 items arranged in seven subscales and assessing three types of intrinsic motivation (motivation "to know", "toward accomplishment", and "to experience stimulation"), three types of extrinsic motivation, and amotivation. In the context of intrinsic motivation, motivation "to learn" refers to a desire for knowledge and performance of activities for internal pleasure, motivation "toward accomplishment" means pleasure in achieving objectives, creativity; motivation "to experience stimulation" expresses the joy of involvement in activities, searching for stimuli, presence of aesthetic experiences and entertainment and excitement (Deci, Ryan, 1985; Vallerand, et al., 1992). Extrinsic motivation includes "external regulation" (behaviour is regulated through rewards and punishment, "introjection" (individuals start to internalize the reasons for their behaviour, but this is not real self-determination as it is limited by internalization of earlier external contingencies) and "identification" (builds on introjection, includes behaviour that individuals consider valuable and important for themselves). Amotivation means that an individual's behaviour is a consequence of forces beyond the individual's control, and feelings of incapacity or incompetence are experienced. In a university environment, these individuals may cease to participate in academic activities (Deci, Ryan, 1985; Vallerand, et al., 1992).

In addition to other psychological concepts such as procrastination (Malatincová, 2015), character (Slezáčková, Bobková, 2014), and ontogenesis (Gottfried, Fleming, Gottfried, 2001), academic motivation was analysed also in relation to demographic characteristics that often appear significant. Some recent studies for example emphasise that intrinsic motivation increases with age (Hegarty, 2010) and that in relation to gender women achieve significantly higher scores compared with men in all motivation subscales except amotivation and external regulation (Hakan, Münire, 2014; Vallerand, et al., 1992).

It appears that the issue of academic motivation is the focus of research studies in relation to student functioning in the academic environment. Despite this fact there are still areas that deserve further exploration. One of the areas is the link between academic motivation and variables relating to the teaching profession, other professions, and basic demographic characteristics.

Methodology

The objective of the study was to analyse academic motivation among university students in relation to selected demographic characteristics. Specifically, the following two research questions were formulated.

Research questions

- 1) What is the relationship between performance motivation and student gender?
- 2) What is the relationship between performance motivation and form¹ of study?
- 3) What is the relationship between performance motivation and type² of study?

¹ Full-time (daily) and part-time (employment) study.

- 4) What is the relationship between academic motivation and age?
- 5) Are there any differences in academic motivation between students without special educational needs and students with special educational needs?

Research methods

The data were obtained by means of the Academic Motivation Scale (AMSC-28, Vallerand, et al., 1992). This is a scale based on the self-determination theory and comprises 28 items divided into 7 subscales assessing 3 types of intrinsic motivation, 3 types of extrinsic motivation, and amotivation. The reliability of the questionnaire reaches an acceptable level of $\omega = .81$ (Vallerand, et al., 1992). Statistical methods applied: t-test, Mann-Whitney U test, Pearson correlation analysis, ANOVA.

Research sample

The research sample consisted of 710 university students (mean age = 22.61, SD = 4.173, range 19-55 years) of whom 116 were male (mean age = 23.34, SD = 3.578, range = 19-42 years) and 594 were female (mean age = 22.47, SD = 4.268, range = 19-55 years). Detailed information about the research sample is shown in Tables 1 and 2.

Table 1. Numbers of respondents by year of study

Year of study	Frequency	%	Cumulat. %
1.	219	30,8	30,8
2.	239	33,7	64,5

The study was conducted in compliance with applicable ethical principles. The research study involved university students on a voluntary basis; the participants were informed about a possibility to terminate their participation at any stage of the research without giving a reason. The participants consented to anonymous data processing and use of data for scientific purposes.

² Teacher training courses (preschool teachers, primary school teachers, lower secondary school teachers, secondary school teachers), non-teaching disciplines (e.g. speech-language pathology, special preschool education, dramatherapy, mentoring, social work, etc.)

Findings

Average values, standard deviations, and reliability of the questionnaire are shown in Table 3.

Table 3. Average values, standard deviations and reliability of the Academic Motivation Scale

Academic motivation and gender

In the context of gender the results showed (Table 4) significant differences in academic motivation between men and women in the following dimensions: intrinsic motivation – to know ($p = .001$, women have a higher score), extrinsic motivation – identified ($p = .003$, women have a higher score), and amotivation ($p = .003$, men have a higher score).

Table 4. t-test of the differences in academic motivation in relation to gender

	t	df	p	Mean Diff.	SE Diff.	95% CI	
						Lower	Upper
Intrinsic motivation - to know	-3,471	708	,001	-,431	,124	-,674	-,187

Amotivation	1,987	708,000	,047	,270	,136	,003	,538

Academic motivation and age

The results of Pearson correlation analysis confirmed a significant correlation between extrinsic motivation – identified ($r = -.112$, $r^2 = .013$, $p = .003$) and extrinsic motivation – external regulation ($r = -.112$, $r^2 = .013$, $p = .003$). In both cases this is a negative correlation, i.e. with age these two types of motivation decrease (Table 7).

Academic motivation and year of study

An analysis of the differences in academic motivation between various grades showed (Table 8) significant differences between students only in two dimensions. In the context of extrinsic motivation – identified, differences were observed between grade 1 and 2 ($p < .001$) and between grade 1 and 4 ($p = .020$), with grade 1 having a higher score in both cases. In terms of amotivation, differences were observed only between grade 1 and 2 ($p = .004$) and between grade 1 and 4 ($p = .001$), with grade 1 having a higher score in both cases.

Table 8. ANOVA test of differences in academic motivation in the context of grades

	F	df	p
Intrinsic motivation - to know	1,426	4, 705	,224
Intrinsic motivation - toward accomplishment	1,527	4, 705	,193
Intrinsic motivation - to experience stimulation	,075	4, 705	,990
Extrinsic motivation - identified	5,145	4, 705	< ,001
Extrinsic motivation - introjected	,708	4, 705	,587
Extrinsic motivation - external regulation	1,901	4, 705	,109
Amotivation	5,186	4, 705	< ,001

Academic motivation and special educational needs

An analysis of the differences in academic motivation in the context of students' special educational needs showed significant differences in the dimension of extrinsic motivation – identified ($p = .007$), with a lower motivation score in students with special educational needs (Table 9). However, due to the small number of these students a non-parametric method was used and therefore, these results should be interpreted as a possible indicator rather than a stable verification of existing differences.

Table 9. Mann-Whitney U test of the differences in academic motivation in relation to special educational needs

	U	Z	p
Intrinsic motivation - to know	4854,000	-1,243	,214
Intrinsic motivation - toward accomplishment	4894,000	-1,195	,232

Extrinsic motivation - external regulation	4573,500	-1,579	,114
Amotivation	5639,000	-,305	,761

Results, Conclusions and Recommendations

The objective of the research study was to analyse academic motivation among university students in relation to selected demographic characteristics. Specifically, these included gender, age, and study-related variables (type of study – teaching and non-teaching; form of study – full-time and part-time; grade). The results suggest significant differences in extrinsic and intrinsic motivation in the context of gender. Women show a higher score in intrinsic motivation – to know and in extrinsic motivation – identified. On the contrary, men achieve a higher score in amotivation (Table 4). Similar research studies (Hakan, Munire, 2014) focusing on academic motivation among university students also point to significant differences in relation to gender. University students (men) show a higher degree of amotivation and extrinsic motivation than women. These findings partially support the

conclusions by Vallerand (1992), who states that women achieve significantly higher scores than men in all motivation subtypes except amotivation and external regulation. Therefore, gender appears to be a significant variable that co-determines the source of motivation.

Another aim of the paper was to assess a potential correlation between academic motivation and form and type of study. A significant relationship was observed only in relation to type of study (teaching vs. non-teaching courses), with a higher degree of amotivation among students of teaching courses (Table 6). The question that remained unanswered is why amotivation, which is significantly negatively correlated with the process and results of education and is characterised by the absence of the motive to act, is higher in future teachers. It can only be speculated that faculties of education are more frequently attended by students who are not planning to become teachers, which is likely to increase the degree of their amotivation. Another possible reason could be the fact that for students of teacher training courses this study was a second or third choice after unsuccessful admission proceedings at a different university.

Another objective was to assess the link between academic motivation and **age**. The results of the correlation analysis confirmed a significant correlation between extrinsic motivation – identified and extrinsic motivation – external regulation. In both cases this is a negative correlation, which means that with age these two types of extrinsic motivation decrease (Table 7). Similarly, Hegarty (2000) refers to a correlation between intrinsic and extrinsic motivation and age, where intrinsic motivation increases with age. The conclusions relating to age also confirm a significant correlation between year of study and extrinsic motivation – identified, where students in the first grade show a higher score in this motivation compared with students in grade two and four. The results are interesting in terms of amotivation because they confirmed differences between students of grade one and students of grade two and four. The results suggest increasing amotivation with length of study with a lower amotivation score in grade one. It is likely that in students who show a higher degree of extrinsic motivation at the beginning of study, their degree of amotivation increases throughout their study. Similarly, Hakan and Munire (2014) confirm an increasing trend of the level of amotivation throughout university study (in grade one the degree of amotivation was lower compared with grade four), while intrinsic motivation decreases in the course of academic career. These results are not optimistic taking into consideration the importance of the teaching profession for the education of the upcoming generation. The question is why this happens. Is it due to the difficulty of the study or inappropriate teaching methods? Is the problem in the personality of university teachers or the quality of students? Or is it because students gradually become aware that the teaching profession is difficult and not enjoyable? The increasing level of amotivation in the course of study certainly deserves a more detailed analysis to reveal possible determinants of amotivation among students in higher grades.

Regarding the fact that the number of university students in faculties of education with special educational needs increases (students with health disability, health and social disadvantage), one of the objectives of the present study is to analyse possible differences in academic motivation in the context of special educational needs. The analysis showed significant differences in the dimension of extrinsic motivation – identified ($p = .007$), with a lower motivation score in students with special educational needs (Table 9). In principle, these findings are logical, because students with SEN are “forced” to exert greater effort in their study and have to overcome more obstacles and at the same time have fewer external rewards, or they are less important and therefore less motivating. However, regarding the small number of respondents, the results cannot be generalized but are rather an indicator of possible differences. Regarding the fact however that for these students the study is surely more difficult (Hopkins, 2011), the authors of the present paper believe it is desirable to address this issue in more detail in relation to the current inclusive trends.

One more finding, which appears obvious at first sight, is worth mentioning. The results did not indicate any differences between the variables in terms of intrinsic motivation. In other words, students did not differ in

intrinsic motivation in any of the aspects analysed in the present study. Therefore, intrinsic motivation is very likely saturated by other factors than demographic. This could involve especially personality variables, values, attitudes, self-efficacy, or attribution trends. These are deeper psychological factors as confirmed by the theoretical definition of the differences or intrinsic and extrinsic motivation as such.

In conclusion, it can be stated that academic motivation is affected by many factors. The partial results suggest a degree of variability in the context of gender, age and type of study. It appears that positive academic motivation supports the desire to learn (Brown, 2009), which is considered a crucial aspect in the process of education. However, the degree of amotivation should not be underestimated in the sense of a loss of meaning and desire to study. It is therefore necessary to pay attention to the forms and quality of teaching, university teachers, and possibilities of building and strengthening intrinsic motivation among university students. In this sense, it is desirable to strengthen a positive attitude to education and students' future career. Considerable potential is in the hands of teachers who can affect students' academic motivation to a large extent.

Abstract

The aim of this study was to analyse the relationships between learning approaches and academic achievement. The data were obtained by means of two questionnaires: the Revised Two Factor Study Process Questionnaire (R-SPQ-2F) and the Academic Achievement Questionnaire (AAQ). The research sample consisted of 710 university students (mean age = 22.61, SD = 4.173, range 19-55 years) of whom 116 were male (mean age = 23.34, SD = 3.578, range = 19-42) and 594 were female (mean age = 22.47, SD = 4.268, range = 19-55). The results suggested that the total score of academic achievement and subscale scores were positively correlated with the deep approach and its subcomponents, and negatively correlated with the surface approach and its subcomponents. The demographic and study characteristics of the participants (gender, study year, type and form of study, and special educational needs) do not affect the relationship between learning approaches and academic achievement.

Keywords: learning approaches, academic achievement, university students, learning, teaching

Introduction

Academic achievement is a key concept in the academic environment and is used to assess not only students' results but also the results of universities as a whole (Farooq, Chaudhry, Shafiq, & Berhanu, 2011; Křeménková, Dobešová Cakirpaloglu, Pugnerová, 2018). It can be said in a simplified way that academic achievement is a mark of success and excellence. There are many ways of describing this phenomenon. Academic achievement is mostly related to GPA (grade point average) and study results in general (cf. academic performance; e.g. Gore, 2006; Stephen & Schaben, 2002). But many authors also accentuate both learning and non-learning or non-performance aspects (e.g. study effectiveness, time management, involvement in extra-curricular activities, taking advantage of external resources; use of university library and its services, awareness of ICT instruments to support study etc.) (Čáp & Mareš, 2001; Novotný, Křeménková, in preparation; Křeménková, Dobešová Cakirpaloglu, Pugnerová, 2018; Leonard, & Insch, 2005; Prevatt, Li, Welles, Festa-Dreher, Yelland, & Lee, 2011; Somech & Bogler, 1999). Finally, academic achievement could be described as the presence and use of various personal skills and traits, and also as the ability to cope with various study requirements (Busato, Prins, Elshout, & Hamaker, 2000; Komarraju, Karau, & Schmeck, 2009). At the same time it should be noted that this is not a final and invariable complex of skills and activities. On the contrary, it may be developed and supported throughout the course of study in the university environment (Hoskovcová, Suchochlebová, & Ryntová, 2009; Průcha, Mareš, & Walterová, 2003). The question is to what extent this really takes place and what reserves

universities have in this respect. However, academic achievement is not a stand-alone construct but is associated with and affected by many factors and variables such as personality, motivation, cognitive styles, decision-making processes, and learning styles or approaches.

In the context of academic achievement **learning approaches** play an important role. Learning approaches could be defined a) as a philosophical concept and the didactic method of teaching and learning strategies; this includes the learning objectives that comprise furthering knowledge, repetition and reconstruction, application, understanding, observation from a different perspective etc. (Dart, Burnett, Purdie, Boulton-Lewis, Campbell, & Smith, 2000); b) in terms of “how a student’s intentions, behaviour and study habits change according to their perceptions of a learning task” (Beyaztaş, Senemoğlu, 2015, p. 193); c) “as the complex manner in which, and conditions under which, learners most effectively perceive, process, store, and recall what they are attempting to learn” (James, Gardner, 1995, p. 20); or d) one of the factors causing differences in the student’s performance (Kaplan, Kies, 1995).

There are several methods available to measure learning approaches¹. We are convinced that The Revised Two Factor Study Process (R-SPQ-2F; Biggs, Kember, & Leung, 2001) suits the academic environment. This measurement tool is based on the “student approaches to learning” (SAL) theory (Biggs, 1993²), which assumes that students’ perceptions and learning-related activities are fundamental to teaching and learning. Further study processes used by students in learning are related not only to the amount of learning but also to the quality of learning (Biggs, 1993, 2007). Biggs suggested the existence of distinct study processes, which have been identified as deep and surface approaches to learning (Entwistle, 1998). The surface approach could be defined as an intention or effort to get the task out of the way with minimum problems and give the impression that the requirements have been fulfilled at the same time. This is connected with learning of isolated facts, misunderstanding the big picture, and of course with negative feelings. The deep approach means that students need to engage in the task in a comprehensive and meaningful way. Students with this approach feel need-to-know and they try to focus on underlying meanings, on main ideas, principles, or successful applications. This requires a substantial base of prior knowledge, so it places demands on learning the details and making sure they understand the main point. Students with this approach experience positive feelings during the learning process (Biggs, 2007). In order to improve the quality of students’ learning, it is fundamental to understand the learning process. Unfortunately, some lecturers at universities fail to identify specific learning styles or approaches of their students and adjust the learning environment accordingly. Nowadays, more than in the last decades, it may be relevant to recognise the different learning and thinking styles of students. Therefore, there is a need to perform a study on student learning approaches in order to improve teaching and learning quality (Amir, Jelas, Rahman, 2001; Sternberg, 1997).

In foreign countries, the correlation between academic achievement and learning approaches is extensively researched, but the results are not convincing and usually confirm a negative correlation between academic achievement and surface approach (e.g. Amidu, 2012; Cano 2005; Hasnor, Ahmad, Nordin, 2012; Watkins, 2001), or no correlation is confirmed (e.g. Phan, 2007). In the context of Czech universities, the relationships between these two constructs have not been sufficiently explored and the effect of learning approaches on

¹ To make it clear, we have to distinguish between learning styles and learning approaches. Briefly, the main point in this context is that learning styles are something that we can hardly change, in contrast to learning approaches, which are relatively “easy” to change (Biggs, 2007). In other words, while learning styles are relatively stable characteristics comprising cognitive, affective and physiological components, learning approaches are not (Baykan, Nacar, 2007; Rajaratnam, D’cruz, 2016). On the other hand, there is an association between these concepts, as learning approaches are linked with and affected by learning strengths, also known as learning styles (Swanson, 1995).

² Originally, this concept comes from a study by the Swedish authors Marton and Säljö (1976), who researched surface and deep approaches to learning.

academic achievement is still insufficiently reflected in education and counselling. One of the causes may be the absence of relevant studies and insufficient communication of this topic.

Methodology

The aim of the study was to analyse the relationships between learning approaches and academic achievement. The researchers focused on which factors of learning approaches were associated with individual domains of academic achievement, in what ways they related to academic achievement, and whether these associations were somehow affected or mediated by students' demographic characteristics (see below).

Research sample

The research sample consisted of 710 university students (mean age = 22.61, SD = 4.173, range 19-55 years) of whom 116 were male (mean age = 23.34, SD = 3.578, range = 19-42 years) and 594 were female (mean age = 22.47, SD = 4.268, range = 19-55 years). For more details about the research sample see Tables 1 and 2.

The study was conducted in compliance with applicable ethical principles. The research study involved university students on a voluntary basis; the participants were informed about a possibility to terminate their participation at any stage of the research without giving a reason. The participants consented to anonymous data processing and use of data for scientific purposes.

Research methods and statistical procedures

³ Teacher training courses (preschool teachers, primary school teachers, lower secondary school teachers, secondary school teachers), non-teaching disciplines (e.g. speech-language pathology, special preschool education, dramatherapy, mentoring, social work, etc.)

The data were obtained by means of the following two questionnaires. **The Academic Achievement Questionnaire** (AAQ, Novotný & Křeménková, in preparation) is a new 9-item questionnaire designed to measure academic achievement. The questionnaire includes three subscales: study performance, coping with study demands, and social adaptation. The items of the second and third subscale are assessed using a Likert scale 1-5, the first subscale is calculated from marks achieved in the course of study. The subscale scores and the overall score are calculated using average values of the items; for the first subscale (in Czech conditions) the average score is calculated based on weighted scores of the items including range normalization. The reliability of the questionnaire subscales equals $\omega = .801, .810$ and $.638$.

The Revised Two Factor Study Process Questionnaire (R-SPQ-2F; Biggs, Kember, & Leung, 2001) uses four subscales (Deep Motive, Deep Strategy, Surface Motive and Surface Strategy) and two higher order factors (Deep Approach and Surface Approach) to differentiate the preferences of learning approaches. The questionnaire uses 20 items on a 5-point Likert scale. The current version of the questionnaire has good psychometric properties. The questionnaire reliability is of an acceptable level: $\omega = 0.73$ for deep approach and $\omega = 0.64$ for surface approach.

Statistical procedures applied: The data were analysed in SPSS 21 using descriptive statistics calculation, correlation analysis, and multiple linear regression (Stepwise method). The assumptions for use were verified in advance.

Findings

Means and standard deviations for the scales are shown in Table 3.

Table 3. Average, standard deviation and reliability for each scale

	\bar{x}	SD	α
AAQ total	3,75	0,51	0,708
AAQ study performance	4,67	0,75	0,741
AAQ study demands	3,42	0,75	0,721
AAQ social adaptation	3,89	0,82	0,446
Deep Motive	13,88	3,55	0,700
Deep Strategy	13,59	3,58	0,725
Surface Motive	12,63	3,65	0,700
Surface Strategy	13,86	3,74	0,679
Deep Approach	27,47	6,56	0,829
Surface Approach	26,49	6,88	0,823

The initial correlation analysis confirmed the assumed association between the preferred learning approach and academic achievement. Higher academic achievement in terms of the overall score as well as individual subscales is positively correlated with deep strategies and learning approaches, and negatively correlated with surface approaches (Tab. 4).

Table 4. Correlation between learning approaches and academic achievement

	Acad.achiev.: total score	Acad.achiev.: study performance	Acad.achiev.: study demands	Acad.achiev.: social adaptation
Deep Motive	,276**	,162**	,247**	,168**
Deep Strategy	,275**	,196**	,249**	,139**
Surface Motive	-,283**	-,155**	-,247**	-,186**
Surface Strategy	-,289**	-,190**	-,254**	-,164**
Deep Approach	,299**	,194**	,269**	,167**

Surface Approach	-,307**	-,186**	-,269**	-,188**
------------------	---------	---------	---------	---------

** significant at a level of $\alpha = .01$

* significant at a level of $\alpha = .05$

The subsequent multiple regression analyses confirmed and particularized these findings (the regression models included only lower factors, i.e. higher order variables such as surface approach and deep approach were not included in the models). In the context of the overall academic achievement score (Table 5) the model ($F(3, 706) = 32.496, p < .001$) explained 12% of variability of the dependent variable ($\text{Adj. } R^2 = .118$).

Table 5. Multiple regression analysis of the correlation between learning approaches and overall score of academic achievement

	R^2	Adj. R^2	change R^2	β	t	p
	,121	,118				
Surface Strategy			,083	-,197	-5,053	< ,001
Deep Motive			,032	,126	2,546	,011
Deep Strategy			,006	,108	2,151	,032

The model was affected by three predictors: lower surface strategy ($p < .001$), higher deep motive ($p < .001$), and higher deep strategy ($p < .001$) were significantly correlated with higher overall academic achievement. Other factors were excluded from the model.

In terms of study performance (Tab. 6) the model ($F(2, 707) = 19.851, p < .001$) explained 5% of variability of the dependent variable ($\text{Adj. } R^2 = .050$).

Table 6. Multiple regression analysis of the correlation between learning approaches and academic achievement: study performance

	R^2	Adj. R^2	change R^2	β	t	p
	,053	,050				
Deep Strategy			,038	,143	3,566	< ,001
Surface Strategy			,015	-,133	-3,313	,001

The model was affected by two predictors: higher deep strategy ($p < .001$) and lower surface strategy ($p = .001$) were significantly correlated with better study performance. Other factors were excluded from the model.

In terms of coping with study requirements (Tab. 7) the model ($F(3, 706) = 25.035, p < .001$) explained 9% of variability of the dependent variable ($\text{Adj. } R^2 = .092$).

Table 7. Multiple regression analysis of the correlation between learning approaches and academic achievement: coping with study requirements

	R^2	Adj. R^2	change R^2	β	t	p
	,096	,092				
Surface Strategy			,064	-,170	-4,300	< ,001
Deep Motive			,026	,111	2,199	,028
Deep Strategy			,005	,103	2,031	,043

The model was affected by three predictors: lower surface strategy ($p < .001$), higher deep motive ($p = .028$), and higher deep strategy ($p = .043$) were significantly correlated with better coping with study requirements. Other factors were excluded from the model.

In the context of social adaptation (Tab. 8) the model ($F(2, 707) = 16.149, p < .001$) explained 4% of variability of the dependent variable ($\text{Adj. } R^2 = .041$).

Table 8. Multiple regression analysis of the correlation between learning approaches and academic achievement:
 social adaptation.

	R ²	Adj. R ²	change R ²	β	t	p
	,044	,041				
Surface Motive			,034	-,139	-3,383	,001
Deep Motive			,009	,107	2,611	,009

The model was affected by two predictors: lower surface motive ($p = .001$) and higher deep motive ($p = .009$) were significantly correlated with better social adaptation. Other factors were excluded from the model.

Partial correlations suggest that the respondents' demographic and study characteristics (gender, year of study, type of study, field of study, and special educational needs) do not affect the correlation between learning approaches and academic achievement (the differences in r values were in the order of hundredths, which did not require verification of the significance of differences using the Fisher transformation and inference test).

Results, Conclusions and Recommendations

The objective of the survey was to identify the correlations between academic achievement and preferred learning approaches. By means of the initial correlation analysis it was observed that higher academic achievement in terms of the overall score as well as individual subscales was positively correlated with deep strategies and learning approaches, and negatively correlated with surface approaches. A negative correlation between academic achievement and surface approaches to learning was also confirmed in their studies by e.g. Amidu (2012), Cano (2005), Hasnor, Ahmad, Nordin (2012), or Watkins (2001). On the contrary, for example Phan (2007) suggested that the correlation between these phenomena was not so obvious and in his study observed a null correlation between academic achievement and deep or surface approaches to learning. The present results of multiple regression analyses partially correspond with the former studies in the sense that the model predicted 12% of variance of the overall score of academic achievement. In this context it can be assumed that the overall academic achievement is affected by a range of other variables/effects. Nevertheless, the results confirm the original assumption that motivation, an effort to understand, and interest in the learning content contribute to better academic results as well as other factors of academic achievement, which is a positive finding. On the other hand, this contribution is not as high as might be expected. In this context it should be borne in mind that the overall score of academic achievement includes not only study performance but also other aspects (organizational and social) that are seemingly little affected by learning approaches. However, more detailed results of the regression analysis concerned with the different aspects of academic achievement suggest the strongest correlation between learning approaches and coping with study requirements (so-called organizational factors). Although this finding is surprising at first sight, it is logical because students with deep approaches to learning experience their study through positive emotions and their study is not a priori burdensome, which may result in their ability to better cope with the circumstances related to their study (e.g. organization of study, scheduling exams, involvement in other study-related activities, field of study, etc.)

Simultaneously, the results raise a question as to whether the system of education and assessment in Czech universities favours those students who really try to understand the learning content compared with those who only learn as instructed and are limited to partial facts without trying to achieve a deep understanding.

At the same time, the results did not show any correlations in the context of students' demographics and study characteristics (gender, year of study, etc.) In other words, the respondents' demographics did not affect the correlation between academic achievement and learning approaches. It seems that this correlation is not effected by the respondents' external characteristics but on the contrary is very probably affected by internal

characteristic. Conversely, for example Staden and Nel (2016) proved a significant difference in the context of year of study.

The present study has some limitations. The first limitation is the research sample, which consists of a specific group of university students of education. This study specialization (in the context of the Czech Republic) expects a higher pro-social orientation and an emphasis on verbal and social intelligence rather than non-verbal and technical aspects. Teacher education (specialization) is also sometimes taken as the second (“safe”) choice (in comparison with the desired field of study), leading to higher numbers of students with a tendency to low study performance and surface approaches to learning. The second limitation is the cross-sectional nature of the study, which does not allow assessment of the interactions between variables in time. Therefore, the results should be interpreted in the context of these specifics.

In conclusion, the main result of this study will be highlighted. The findings have clearly confirmed the correlation between learning approaches and academic achievement. These findings are of significant importance especially in the context of this specific research sample. For this reason, it is necessary to accentuate and improve university training of future teachers and other professionals in the school environment in the sense of learning about and improving deep approaches to learning. At the same time, other ways to support academic achievement should be sought.

Abstract

The focus of this paper is to examine the interrelated influences of service delivery in institutions of higher education (HEIs) in Oman to advance sustainable education for smart cities. An important objective of this study is the evaluation of the pertinent educational curriculums and programs used by HEIs in Oman to stimulate and develop the sustainability of the smart city approach. Researchers intend to adopt aspects of the triple helix model, which have been used as an analytical framework to analyse the knowledge-based innovation systems in HEIs. Data is collected from stakeholders in HEIs through structured and semi-structured interviews, and questionnaires combined with statistical trends from officially published reports. Data analysis will keep with Lombardi et al., (2012) methodology and the employment of Stata software will help in the examination of correlation between variables. The study contributes to the debate on HEIs' role in smart city initiatives and has implications to their part in advancing higher education for the development of smart city initiatives in the region, which is an evolving concept that requiring ample investigation to further our understanding of it especially in developing countries.

Keywords: Sustainable education, smart city, institutions of higher education, technology, innovation

Introduction

Education has been revolutionized by technology and so higher education institutions (HEIs) must create a richer and inspiring experience in learning is crucial. HEIs need to know their position for them to benefit fully from current smart methods in education like social learning and networks as well as game-based learning. The current paper examines the educational setting in Omani HEIs as part of the smart city ecosystem. The study includes smart learning initiatives already in place and vital components of the curriculum that nurtures innovation among its alumnae, which is anticipated to have strategic consequences for the country, which is in the process of endorsing a smart learning education configuration. The smart city approach in Oman is still budding and there is a strong need to support this ecosystem. Some of the most important concepts relating to teaching are innovation, smart technology, and industrial innovation that power sustainability and these must be addressed for next students generation (Wolff, Kortuem, & Cavero, 2015).

Studies in the fields of smart cities have widely emphasized the positive impact of a smart city to “ tackle urban sustainability issue ” (Wolff et al., 2015; p.2), and the role of higher education institutions on stimulating and promoting innovation and smart cities. Meijer & Bolívar (2016) stated that “Smart technologies, smart collaboration, a highly educated population, and effective institutions are argued to be needed to face the challenges of modern cities” (p.393). Education has been widely discussed in the literature as one of the significant elements for the development of the necessary human capital as well as technological infrastructures for a smart city (Caragliu, Del Bo, & Nijkamp, 2011; Hollands, 2008; Meijer & Bolívar, 2016). Promoting

centres for a smart city at HEIs is important to develop the smart cities so that students can play their active and innovative roles in smart city initiatives (Winters, 2011). In that sense, the debate in the literature continues regarding either building the human capital first or the necessary technology (Nam & Pardo, 2011). The 2020 Europe strategy has focused on education, research and innovation areas as major factors in the promotion of smart cities (Cocchia, 2014).

Two clear gaps in the arena of smart city education inspire the present study. First, a few studies have been done in developing countries that explored education as the main player in stimulating smart city initiatives. This is in spite of the shared view that “a smart city is a humane city that has multiple opportunities to exploit its human potential and lead a creative life” (Nam & Pardo, 2011, p. 285). Though there are many instances from advanced economies, evidence of the influence of HEIs on supporting students to be more creative, innovative and able to create applications on smart city initiatives in developing economies continue to be rare (Fadaeenejad et al., 2014). Second, little answers are available in the literature that focuses on the part played by HEIs in developing countries and their sustainable education for smart cities (Liu, Huang, & Wosinski, 2017). Most studies focused on guesstimating the development of smart cities without observing the main factors that promote improved life in smart cities, which is mostly due to people (Winters, 2011).

The aim of this research is to review the relevant educational curriculums, activities, and programs used in Omani HEIs to encourage and advance the sustainability of the smart city ecosystem. Several studies suggest that people, education systems, learning, and knowledge or what they call “human dimensions” are the key aspects for smart cities approach (Cocchia, 2014). Furthermore, our study sheds light on the effectiveness of these HEIs education methods and strategies that are used to develop this concept, mostly among undergraduate students in Oman. A literature review indicated that such insights are still scarce especially with when it comes to developing countries.

Consequently, the present research aims mainly to contribute to the debate on smart city education at HEIs. This is because smart city education in developing regions is a budding notion and requires more research to advance our understanding of what it takes to build smart cities in the region. The study delivers thorough indications and analyses of the smart education situation in Omani universities and colleges, the effectiveness of curriculums, activities and programs used by HEIs in Oman to kindle and endorse the smart city approach through improved preparation of its graduates giving them the tools, settings and network to actively participate in the smart city movement. The study contains smart learning initiatives now in place that are anticipated to have strategic implications for the country. The second contribution of the research lies in the examination and confirmation of the triple helix model as an analytical framework for gauging the capabilities of HEIs in Oman. The end goal of this being to help decision makers strive for as well as cultivate the creativity and smart education necessary for building the human capital to promote the smart city approach.

To conclude this section, education has been revolutionized by technology and so HEIs must create a richer learning experience for its constituents. In turn, smart learning initiatives can have a vital role in nurturing innovation in and preparing alumnae for smart city initiatives. The smart city approach in Oman is still budding and there is a strong need to support this ecosystem. Some of the most important concepts with this regard are the fostering of innovation and smart technology that power sustainability and the current study hopes to address this gap by in the preparation of the next generation of students. (Wolff, Kortuem, & Cavero, 2015). With that respect, the role of HEIs in stimulating and promoting innovation and smart city initiatives is undeniable (Meijer & Bolívar, 2016). Moreover, a few studies have been done in developing countries that explored education as the main player in stimulating smart city initiatives. Little answers are available in the literature that focuses on the part played by HEIs in developing countries and their sustainable education for smart cities (Liu, Huang, & Wosinski, 2017). Most studies focused on guesstimating the development of smart cities without observing the

main factors that promote improved life in smart cities, which is mostly due to people (Winters, 2011). Finally, building on the grounds put forth in the above, this study aim at answering the following four main research questions:

1. What are the applicable curriculums and programs used by HEIs in Oman that can support and help in the development of a smart city in Oman?
2. Does the education system in Omani HEIs effectively support the development of smart city initiative?
3. What are the recommended methods to promote the interest of smart city approach among students?
4. Do Omani HEIs have the capabilities to strive and nurture a creative environment for smart city initiatives?

Furthermore, from the mentioned analysis the following study objectives emerged:

- I. Explore the impact of service delivery in Omani HEIs to develop sustainable education for smart cities.
- II. Adopt aspects of the triple helix model (Etzkowitz, 2008) that can be employed to analyze the knowledge-based innovation systems in HEIs.

Method

The smart city concept is made up of ‘smart people’ features and the level of educational services afforded that is fundamental to ‘urban growth’ and sustainable development (Winters, 2011). The present research project explores the relationship between the ability of Omani HEIs to implement smart education systems to develop human capital to its citizens and prepare them in the best way for smart city initiatives (Bățăgan & Boja, 2012).

In the current study, researchers implement aspects of the triple helix framework to analyse the knowledge-based innovation systems (Lombardi, Giordano, Farouh, & Yousef, 2012). In a recent paper, Etzkowitz (2008) stressed that the move towards a knowledge-based society has given universities a bigger role to play. In fact, the role of universities as originators of knowledge has become more valuable since innovation is increasingly based on science. Consequently, university, industry, and government have very equal responsibilities that it’s not just one specific component that is necessarily the impetus of the triple helix model of innovation. For this reason, the increased potential role played by universities for smart city initiatives is being suggested particularly with regard to how technology transfer offices were set up by universities to promote the transformation of university research from commercial value to actual commercial goods.

To conclude this section, the methodology followed by researchers in the present work includes conducting structure and semi-structured interviews and discussions with relevant focus groups comprising of various stakeholders from the Omani HEIs including individuals in management, professional and decision making positions (public and private). Further, questionnaires are distributed to selected samples of the population such as students, academic and professional staff in HEIs in Oman (public and private). All this will be backed up by statistical trends and observations by policy makers and officially published reports.

Findings

The current study has HEIs performance in delivering smart sustainable education as the dependent variable estimated using five main categories that are based on the triple helix model. The research framework shows the proposed antecedents to HEIs performance with regard to smart city initiatives (Figure 1). These five categories are:

- 1) Smart Governance (related to participation)
- 2) Smart Economy (related to competitiveness)
- 3) Smart Human Capital Indicators (related to people)
- 4) Smart Living (related to the quality of life)

5) Smart Environment (related to natural resources)

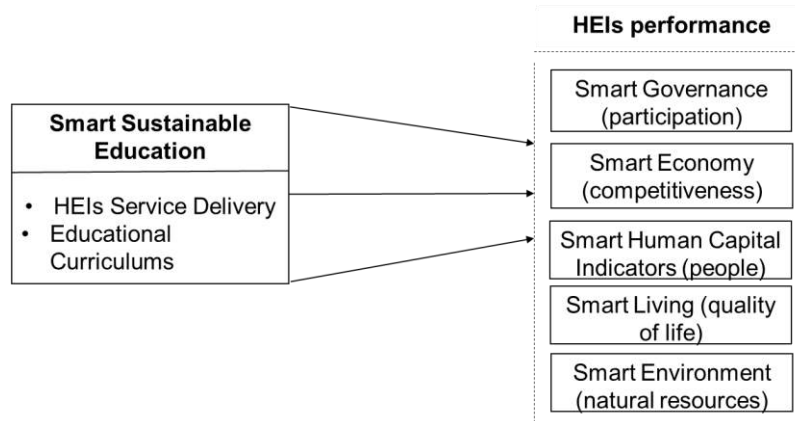

Figure 1. Research Framework

For the purpose of this study, an empirical examination requires the operationalization of the following variables and connecting them to the five main categories above in the triple helix model factors that are assessed in Omani HEIs (Caragliu et al., 2011; Hall et al., 2000; Lee & Hancock, 2012; Neirotti, De Marco, Cagliano, Mangano, & Scorrano, 2014):

1. Campus investment in infrastructures and building intelligence sustainability like building smart applications, network, smart access, data usage, using digital education (e.g. interactive whiteboards, e-learning systems), and smart green services, etc.
2. Investing in human capital by attracting talents and academics as well as collaborative partnerships
3. Students' awareness of smart city concepts in terms of curriculums, workshops, creative classes, and participating in local and international competitions.
4. Smart city governance by using prototypes to oversee smart city traditions.

Finally, data analysis will keep with the methodology employed by Lombardi et al., (2012) and software such as Stata to investigate the correlation between variables. For the time being, data will be collected from several sources including:

1. Conducting structure interview with top management, professional and decision makers at some selected HEIs in Oman (public and private). In addition to structured and semi-structured interviews, researchers need to use focus groups to gather important ideas and viewpoints from relevant stakeholders in HEIs, government, and industry on how to improve educational programs for smart city initiatives.
2. Distribution of a questionnaire from selected focus groups such as students, academic and other professionals in some selected HEIs in Oman (public and private).
3. Observing statistical trends from officially published reports

Conclusion

The primary contribution of the current paper with broad implications is a more profound understanding of the best practices that are implemented in HEI and what particular role they play in the development of smart city initiatives. This work attempts to examine the influences of service delivery in HEIs on the development of sustainable education for smart cities in Oman. The study reviews the relevant educational curriculums, activities, and programs used by HEIs that are needed to stimulate and develop the sustainability of smart city initiatives. Researchers adopt aspects of the triple helix model, which have been used as an analytical framework to analyse the knowledge-based innovation mechanisms in HEIs. Data collected from various stakeholders in

HEIs through structured interviews, and questionnaires and statistical trends collected from official published reports can reveal considerable information about the HEI effectiveness in that regard. The study contributes to the debate of HEIs' role in smart city initiatives and has implications to their role in education for smart city initiatives developing in the region, which is an emerging concept that demands more research to improve our understanding particularly in developing countries.

In conclusion, to narrow down the scope of the current paper, researchers must make their way backward from the long-term government and universities plans to the present state to figure out the missing links that need addressing. Further research is required to find practical ways to evaluate educational curriculums and programs used by HEIs. Moreover, in-depth expertise of specific aspects of the triple helix model must be uncovered before using it as an analytical framework to analyse the knowledge-based innovation systems in HEIs. Finally, combining Lombardi et al, (2012) methods in collecting and analysing data with focus group interviews will need further exploration for practical implementation in the current study.

Abstract:

The authors systematised having experience in the following disciplines: Organizational Culture, Behavioral Sciences, Business Ethics, Negotiation Techniques, Business Organization and Management, Technology Management, Innovation Management, Strategic Management at Azerbaijan Institute of Management of National Economy (now faculty of UNEC) Azerbaijan State Economic University - UNEC during 1994-2018 years. This paper analyses the statistical data of higher education in Azerbaijan for 2000/01-2017/18 using statistical and comparison methods of investigation, methods of observation and collecting dates. Authors also consider the positive and negative factors which influence to education process by expert SWOT analysis method. The main research questions are as follows:

How is higher education developing in Azerbaijan? Does the Azerbaijanian government support young citizens leaving abroad for higher education? Do teachers use the innovative teaching methods? What innovative teaching methods are used to train specialists for the national economy? What innovative techniques and methods need to be introduced into the learning process?

The educational system should be closely integrated into the national economy of Azerbaijan, sensitively catch the ongoing innovation changes in higher universities of Azerbaijan. Authors have got this result: innovative transformations in the educational process had developing and changing at the request of society, public sector and also large and medium-sized entrepreneurs.

Keywords: state support of higher education in Azerbaijan, innovative changes in higher education, innovative teaching methods in universities, a rational combination of traditional and innovative teaching methods, prospects for the development of higher education in Azerbaijan.

Introduction

Recently, higher education has become an important factor in the competitiveness of countries. Each country is forced to train personnel with a high level of education in order to prepare the basis for innovative transformations, which in turn not only develops the national economy, but also strengthens its position in the global market. Estimates by specialists from the Organization for Economic Cooperation and Development (OECD) confirm that education costs are very, very high-yielding investments that pay off several times [16].

The higher education system should be closely integrated into the national economy of the country, sensitively catch the ongoing innovation changes and adapt to them, respond to the current trends in the technological and innovative development of the national and world economy. Consequently, the use of innovative techniques and teaching methods will contribute to the improvement of qualifications and skills of students and undergraduates, improve the quality of education in Azerbaijan.

Authors consider this investigation by following research methods: observation method, data grouping method, statistical analysis method, data comparison method. The authors gave an expert assessment using SWOT analyses.

The process of education as an economic category interacts with various sectors of the national economy and economic and production activities. In this case, all resources (labour, technology, materials, as well as raw materials,

energy, information resources, etc.) are combined in a single process of reproduction and reproduction of the total social product [7, 113].

In the process of education, human capital is formed and modified. The formation of human capital in Azerbaijan plays an important and priority role for the state. These government measures are treated as "Azerbaijan's Development Concept - 2020: outlook for the future» [3]," National Education Development Strategy of Azerbaijan Republic» [4], Laws of Azerbaijan "About Education" [13] and "About Science" [6].

In investigation of Azerbaijan higher education developing authors have considered the statistical dates. During the years of the restoration of the sovereignty of Azerbaijan the number of students, also the number of foreign citizens studying in the country's universities has increased. As can be seen from table 1. the number of bachelor students in the academic year 2015/16 increased by about 27% compared with 2000/01 [5]. Over the same period, the number of bachelor students in the group of agricultural specialties increased (approximately 82%). The indicators of next group specialties also increased: in economics and management speciality - approximately 37%, in technical and technological sciences - approximately 29%. During the same period, the proportion of bachelor students in specialty groups of natural sciences decreased (approximately 44%). At the same time the share of bachelors on speciality humanities and social sciences decreased (approximately 51%). As can be seen from table 1. the number of bachelors increased by about 15% over the academic years 2015/16-201 /18. The increase in the number of bachelors was observed by groups of specialties in agriculture - about 49%, for natural sciences - 14; for economic disciplines, also in the humanities and social sciences - about 15%, for technical and technological disciplines - about 16%.

Table 1. Number of bachelors, who have education in state and non-governmental universities of Azerbaijan (men). [9]

Years	2000-2001	2010-2011	2015-2016	in 2015/16 to 2000/01, in %	2017-2018	in 2017/18 to 2015/16, in %
Number of students- bachelors, total- men	26403	29904	33645	127.28	38546	114.56
Of them on speciality:						
Natural science	2532	1390	1436	-43.29	1635	113.85
Agricultural science	315	471	571	181.69	850	148.86
Economy and management	4890	6174	6663	136.57	7656	114.90
Human and social sciences	9088	3258	4539	-50.06	5209	114.76
Technological science	5930	7094	7614	128.40	8380	110.06
Etc.	3648	11517	12822	351.48	14816	115.55

As can be seen from table 2. for the period 2000/01-2015/16 the number of masters in the humanities and social sciences has decreased (about 42%), but the proportion of graduate students in all other areas of education has increased: in the natural sciences by about 75%, in agriculture - about 163%, in economics and management - 213%, on technical and technological disciplines - about 40%. According to the data of table 2. the increase in the number of masters was observed for the period 2015 /16-2017 /18 (32%) [5]. The number of masters in natural sciences increased by 45%, in agricultural disciplines approximately 24%, in economics and management - 12%, in the humanities and social sciences approximately 35%, in technical and technological disciplines by 68%.

Table 2. Number of masters, who have education in state and non-governmental universities of Azerbaijan (men). [8]

Years	2000-2001	2010-2011	2015-2016	In 2015/16 to 2000/01, in %	2017-2018	In 2017/18 to 2015/16, in %
Number of masters, Total (men)	2752	3698	4953	179.98	6515	131.53
Of them on speciality:						

Natural science	321	548	560	174.45	814	145.35
Agricultural science	35	21	92	262.86	114	123.91

Etc.	83	163	873	1051.80	1157	132.53

Recently, the number of foreign students receiving education in Azerbaijani universities is growing every day. For example, republican universities prepare specialists not only from CIS countries, but also from abroad in the field of oil and gas production and refining, for the petrochemical industry, for the industry of petroleum engineering, in the field of oil shipping, military science, in philology, history, in mathematics and in other disciplines. Note that the area of the countries is the most diverse and covers almost the Earth world (from the USA, Canada, Latin American countries to China, from the countries of the African continent to European countries).

For the period 2000/01 - 2017/18 academic years, the proportion of the number of bachelors and masters combined increased by 128.3%. But for the period 2010 /11-2017/18 years the proportion of students from Russia increased by 151.8%, from Ukraine - 300%, from Kazakhstan - 66.7%, from Turkmenistan - 70%, from Uzbekistan - 6.3 times, from the USA 5 times, from Georgia - 136.4%. Unfortunately, the proportion of students from Turkey has decreased (by 32%).

According to statistics [5], over the past 18 years, the number of Azerbaijan citizens receiving education abroad has also increased. The number of Azerbaijani youth receiving higher education in foreign countries has increased almost twice (period 2000 /01-2017 /18). The period 2010 /11-2017/18 years differs by particular activity of various educational programs from Europe and Asia, which particularly influenced the growth of the number of students studying abroad. The growth in the number of students in the USA from Azerbaijan is especially noticeable (this indicator has increased by twice), in Canada (280.5%), in Germany - 116%, in the UK - 112, 5%. Unfortunately, the number of students receiving higher education in Turkey has noticeably decreased by 32%

The second question of research was next - Does the Azerbaijanian government support young citizens leaving abroad for higher education? It should also be noted the role of state support in obtaining highly qualified education in Azerbaijan [11]. According to the "State Program for Teaching Higher Education of Azerbaijanian Youth in 2007-2015" [12] of December 31, 2016 State Oil Fund of the Azerbaijan Republic receive a grants for 3,302 students who are educates not only in European states, but also in Canada. About 29% of the total number of bachelor and master students are educated in Great Britain, in Turkey - 22.1%, in Germany - 12.4%, in Canada - 7.2%, in the Netherlands - 5.2%. About 4 % of bachelors and masters are educated in Russian Federation [12]. It should be noted that the majority of these are masters (79.0%) [10].

A significant part of masters receive higher education mainly in economic specialties. The most popular among young people is the specialty "Economics and Management" (722 people in 2017). In second place in popularity are specialties related to engineering knowledge (138 people in 2017). There is also interest in the legal sciences (120 people in 2017) and the ICT field (118 people in 2017). The same situation can be observed among bachelors [12]. In investigation of second question author have received an answer – Yes, Azerbaijan government support young scholars in receiving higher education abroad. They can work in different fields of national economy, especially in bank and insuring sectors, in tourism industry, in government structures and in high education sector of Azerbaijan.

Many alumnus, when returning home, work not only in foreign companies, but also in higher education sector of Azerbaijan. The first pioneers among them were graduates of the one-year course of top managers from Turkish Istanbul University since 1991, graduates of Istanbul University on the VAQF's pilot project of the Turkish World

Research Foundation in Baku, who also received a master's degree in Turkey and worked as teachers in the Azerbaijan Institute of Management of National Economy under the Cabinet of Ministers of the Republic of Azerbaijan since 1997 (now faculty of UNEC).

In Azerbaijan Institute of Management of National Economy under the Cabinet of Ministers of Azerbaijan Republic was also organised the three-month course of market economics' course by the professors of the Kiel University of Germany. There in the period 1994-1997 was organised the three-year course of "Public Administration and Management" under the TACIS programme. Lecturers and Trainers from Nottingham Trent University (Great Britain), the University of Maastrich (Netherlands) and the Institute of Management of Ireland delivered the disciplines in Economics and Public Administration to trainees from Azerbaijan. At the end of these courses was established the School of Public Administration in Azerbaijan (SPAA), whose senior teachers taught modern methods and techniques in economics and management to senior officials of the Customs Committee, the Ministry of Taxation of Azerbaijan, employees of the Central Bank and other organizations in 1995-2001. Nowadays, many graduates of these courses teach at Azerbaijan State Economic University, at Baku State University, at Western University, at Baku University of Business, at private university Azerbaijan, and others. Since 2001, senior lecturers of School of Public Administration in Azerbaijan (SPAA) and teachers who graduated from the Istanbul University faculty began working in the Business Administration faculty of the Azerbaijan State Economic University (UNEC).

Since 2004 various programmes of the European Community and Asia suggest to Lecturers and Researchers of Azerbaijan State Economic University (UNEC) some advanced training. For example, according to the latest data from the UNEC website, a vacancy is open for receiving scholarships for research and internship at the Kong-Gong University of Japan, at universities in South Korea, and at universities in Turkey. Every day the number of teachers who have received higher education abroad is growing whose actively use the innovative teaching methods and techniques in practical classes and lectures.

Students enrolled in undergraduate and graduate programmes also have the opportunity to receive additional education in universities in Europe, Asia, and the America continent. According to the latest news from the UNEC website, they have the opportunity to study from the third year at French Montpellier University, London Scholl of Economics and get a double diploma in education [14].

The third question of research was next - Do teachers use the innovative teaching methods? Authors would like to consider this problem in detail.

Innovative techniques and teaching methods implemented in Azerbaijan State Economic University (UNEC)

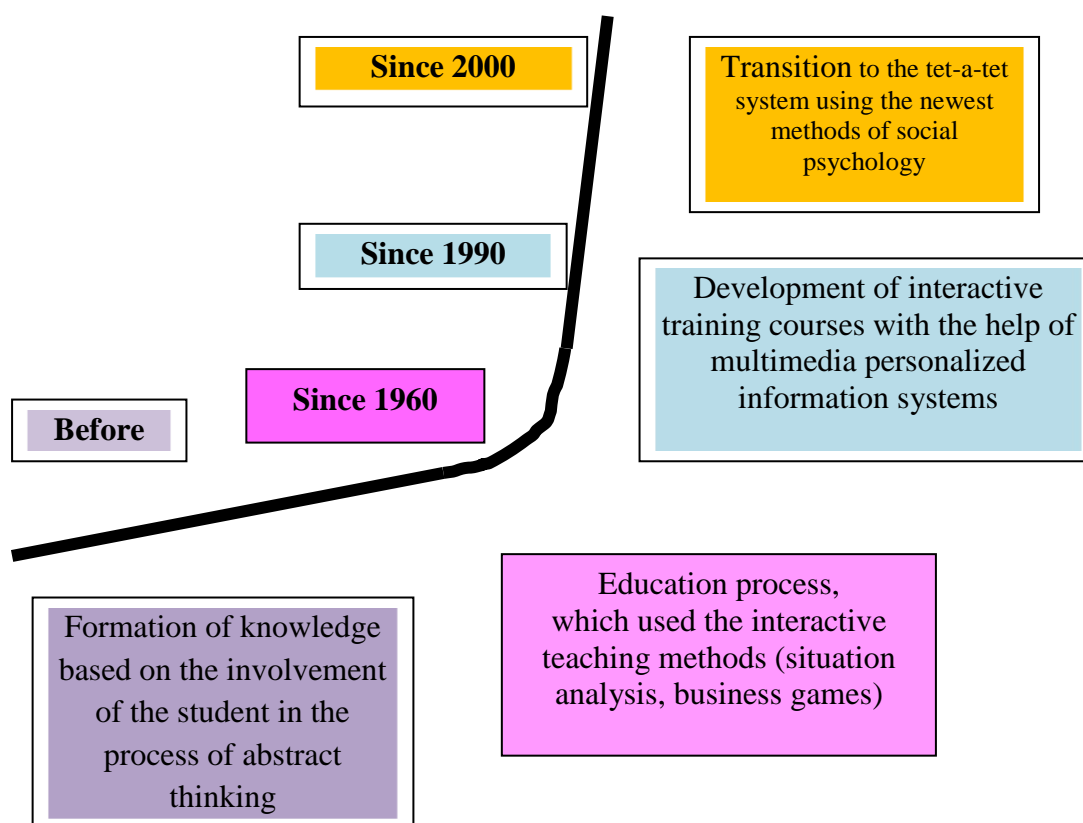

In conditions when the formed education system ("supporting education") is gradually being replaced by an innovative education model ("creative learning") more of trainers and tutors are looking the new teaching methods in the educational process. In this process have been changing the requirements to all interested persons of education: tutors, teachers, trainers, students, administrative staff of university, finally all educational system.

As can be seen from the Scheme 1. the traditional system of education goes through several stages on the path of improvement. Training on the basis of indispensable involvement in the environment of thinking in the 1960s of the last century proceeds to the training of practical skills on the basis of such training seminars as case studies, business games, learning systems. Since the 1990s the educational process has transferred to a new stage of learning - the development of interactive courses using personalised multimedia systems (Personal computers, mobile phones, distance learning, etc.). Further technical improvements should be replaced by an educational process based on the tet-a-tet technology of a student with a trainer or teacher using various socio-psychological methods of teaching [1].

The educational process, which actively used the Soviet system, has some drawbacks:

- Classroom education system - the transfer of knowledge through a survey lesson - does not meet modern requirements for the use of creative activity;
- Education programmes are mostly dogmatic in nature, not adapted to actively changing conditions of reality;
- The methodological base of textbooks is so outdated that many scientific achievements and recent discoveries are not reflected in them;
- There is no proper motivation of the average student for independent thoughts and actions, i.e. to the ability to develop independently and to replenish existing knowledge.

Scheme 1. Education process and requires to its development.

In this context, schools and methods of developmental education, which teach the dynamic perception of reality, are of great importance. The specificity of the education system should be manifested in its ability not only to provide the student with knowledge, but also to form the need for continuous mastering them, i.e. develop the skills and self-education skills. In addition, for the purpose of productive professional activity, it is necessary to instill in students such important qualities as creativity, independence, enterprise, agility, stress resistance. To this end, since the 90s of the last century, they began to use innovative, reflective business games, in which situations of choice and decision-making are modeled.

If we take into account the fact that new psychological tests and business games have been actively used in the educational process in the spatial context of the former Soviet Union since the 1980s (they cover the period of

creating interactive educational programs taking into account multimedia tools and information technologies, as well as tet-a-tet based programmes' learning which using various socio-psychological techniques), the active use of psychological techniques in teaching and in the educational process has now become not only fashionable, but also necessary condition of the process of interactive learning.

These processes include the use of an immediate survey of students according to the method of the Mentimeter system, the joint design of the business plans of students under the guidance of a trainer. The use of interactive forms of learning, such as testing after a lecture, e-consultations, and e-learning, helps realise the benefits of learning: mobility, interactivity, memorability, flexibility in use, accessibility, reduction of training expenditures [16].

Now, in all developed countries of the world, a lot of attention is paid to the process of socialisation and upbringing of new generations of society. Scientists distinguish two fundamental approaches in pedagogy: nature conglomeration or cultural conglomeration; following the child's "natural" nature or obeying its culture? The scientists' answer is led to a single goal. At the same time, the goal of education is to lead to culture (improvement of the student's positive creative qualities), and the method of education should be based on the nature of the student (identification of generic, external, internal psychological negative factors and their correction in a positive direction).

For investigation of forth question - What innovative teaching methods are used to train specialists for the national economy? – authors analysed the process of education in UNEC and have some expert conclusion.

As can be seen from table 3. only strong students are able to better adapt to the new world requirements of training, and weak students perceive all innovations as a blow to their ego and actively resist innovations. Students with average statistical knowledge at the beginning watch for innovations in education with caution, but after adaptation they perceive these innovations positively.

Table 3. SWOT Analysis of Innovative Training in High Education School of Azerbaijan

<p>Strengths</p> <ul style="list-style-type: none"> ➤ Developing the ability to think independently and make decisions; ➤ Strong students gain independent work experience; ➤ The Lecturer or Trainer can control not only the student's behavior, but also the process of their thinking. 	<p>Weaknesses</p> <ul style="list-style-type: none"> ➤ Weak students do not gain independent work experience; ➤ Students' self-control may be weakened; ➤ Not all tasks are completed on time.
<p>Opportunities</p> <ul style="list-style-type: none"> ➤ Teaching time is shortened by increasing attention to detail; ➤ There is a sincere interest in the subject of study. 	<p>Threats</p> <ul style="list-style-type: none"> ➤ With the strengthening of social ties between students, ties with teachers deteriorate. ➤ Lack of control can contribute to laziness;

Using the new approaches of learning in their course (business games, case studies, testing, etc.) the trainer and teacher can adjust the subject of their subject according to the interests of students and their level of preparedness; pay attention to the overall level of assimilation of complex topics; focus on clarifying topics that are difficult for students to understand. In addition, a poor student has a chance to take the exam several times until he reaches the desired result.

Using the new approaches of learning in their course (business games, case studies, testing, etc.) the trainer and teacher can adjust the subject of their subject according to the interests of students and their level of preparedness; pay attention to the overall level of assimilation of complex topics; focus on clarifying topics that are difficult for students to understand. In addition, a poor student has a chance to take the exam several times until he reaches the desired result.

Results

Prestigious models of higher education are the Chinese model, and the European education system, each of which has its own content, principles, values and specificity. Basically, the formation of a high level of higher education should be based not only on a high level of higher education with the support of the government, on scientific and technical cooperation and cooperation of universities of the whole world.

For the formation of a quality higher education Azerbaijan transfers to implementation of principle of openness, not limiting the student in time and spatial framework: the student gradually develops into a subject who decides for himself what disciplines and when he can study and when he can pass the exam. And it forms the autonomy and sense of responsibility of the student, taking into account his individual personality characteristics.

The development of cooperation and interaction of universities is possible in terms of joint scientific research developing. For this purpose inter-university laboratories are being formed as centers of collective use, interuniversity departments are being created, regional centers of quality management system certification are being formed, programs for the export of educational services (training programs for bachelor and master) and technologies (distance learning programs, interactive business games using information technologies) are being developed which will contribute to the development of innovation activities in the country.

Higher education should be based on using of information and communication technologies, on development of network distance learning methods. The creation of joint information resources contributes to developing of educational technologies and the implementation of e-learning, the introduction of innovations and the acquisition of positions like as the regular customer and the regular provider of educational, scientific and methodological services, consultations, etc. It should be noted that information technologies only enrich the learning process. Management of the learning process remains with the teacher and trainer. Only the teacher organises the procedure of contact with the student during consultations or through communication on the Internet.

Using the innovative learning techniques the teacher works as an expert and consultant (tutor, moderator, mentor) who helps to student to navigate the world of various information. With the expansion of the circle of consumers of educational services the encouragement is used as a method of active self-realisation among students.

The fifth question of research - What innovative techniques and methods need to be introduced into the learning process? – considered some facts in education process and have got the next results. Innovative characteristics of new teaching methods are as follows:

- 1) to use the irrational (inherent in the East) and also rational (inherent in the West) analysis methods in study and in research;
- 2) to support of constant attention and interest of students on the situation being analysed;
- 3) to use of non-standard methods of analysis;
- 4) to develop of students' creative approaches in identifying the details, as well as resolving the proposed situation.

It is necessary to note Azerbaijan high education system has got some problems that still need to be solve. Unfortunately, higher education in Azerbaijan has a number of shortcomings, which include the following:

➤ There is no unification in education programmes for various disciplines, which creates certain difficulties for students, especially for students of private universities. These disciplines mainly include new educational courses in economics, sociology, psychology, information technology, and philosophy. There are no uniform textbooks, especially in Azerbaijan language;

- Some knowledge is not adjusted in accordance with the temporary stage of social development, some lectures contain old topics, the methodological base of education is weak. Many students are not familiar with the scientific achievements of Azerbaijanian and other Turkic-speaking, Islamic scholars of the middle Ages. For example, many do not know that the founder of sociology was Ibn Haldun, the scientific heritage of Aristotle and the ancient Greeks was restored thanks to the abstracts of Al Farabi (for example, look at the course “Behavior”) [2];
- With the development of information technology more students use telephones and smartphones and they pass valuable information past the ears. There are no teaching techniques using students' mobile gadgets, which would contribute to their active involvement in the educational process;
- The principle of learning “a student must able to apply acquired specific knowledge in his future profession” is gradually replaced by the principle “a student must select resources-knowledge to adapt to new conditions and be able to find and correctly use various options for solving life problems”. The task of the faculty, management and specialists of high schools is to create and form the new schools and methods of developmental education that teach the dynamic perception of reality;
- Not all foreign diplomas from foreign countries are accepted by the Ministry of Education and the Higher Attestation Commission of Azerbaijan Republic. If this issue is resolved by bilateral agreements between the CIS countries, then there are no agreements between Azerbaijan and other European countries and countries of the Americas which creates some obstacles in the identification of BSc’s., MSc’s. and PhD’s Diplomas.

Conclusion and Recommendations

The implementation of innovative techniques and methods of functioning in universities’ administrating create some opportunities and prospects for accelerated access to new markets. The development of information technology contributes to the network interaction of the educational process, reduces expenditures; expands access to information not only in the network of the university itself, but also in the networks of the university partners. And it promotes the sharing of risk among network members, strengthening cooperation ties.

Summing up, we note that Azerbaijan, being exactly in the middle of the Eurasian continent, at the junction of Europe and Asia, between the Christian and Muslim worlds has a wide potential for implementation of teaching different methods. And in turn, Azerbaijan develops traditional areas of science - mathematics and higher mathematics, philosophy, philology, archeology, history, learning old languages as well as geophysics, chemistry, mineralogy, and other disciplines. But, unfortunately, Azerbaijan has not yet created its own development model in the field of higher education. The need to create and form a national model of higher education is a priority task for the society and universities of the republic.

The preparation of specialists with higher education is an interacting system that determines the consideration of the features of the educational process throughout the world. It is necessary to take into account the fact that in the context of globalisation many young people who focused on career growth prefer to receive a higher education that can compete with the best European standards. For this purpose, it is necessary to form such a model of higher education in Azerbaijan that could train specialists not only for the CIS countries, but also for Europe and the whole world. It is necessary to create the structure which will be cooperate university and research institutes’ activity on the example of the Research State University of Nizhny Novgorod of the Russian Federation [15].

The authors suggest that the creation of an information base about specialists who have been trained abroad and working in the universities of the republic is one of the first steps for the formation of the faculty. Secondly, it is necessary to form groups for creating shells for content as part of network specialists in various disciplines. Thirdly, it is necessary to continuously update and improve training programmes, business games, programmes for analysing a specific situation for sale through the information network - SKYPE, WHATSUP, etc. Fourth, it is necessary to

develop scientific and technical cooperation in developing joint training programmes with the CIS countries. Fifth, it is necessary to adjust the system of knowledge assessment and testing the level of competence, to form a unified system of knowledge assessment.

Abstract

Science, knowledge, scientific output and scientific enterprises are leading resource which possesses decisive significant in the field of general development and especially in economical development. It was founded that the role of number of staff dealing with the research is lower in executed scientific technical works for objective reasons. It is explained as follows: their potential is not fully used; In order to realise their potential the favourable environment, conditions and initial capital are not at the same level. Correlation and regression equation (OLS) structured according to the mathematical economy methods and dependency among variables are determined. Application of obtained and will be obtained scientific achievements, inventions are very weak in strong competition in globalization and international free economic conditions.

Keywords: Scientific research activity, Researches and developments, Indexes of scientific citation

Introductions

Science, knowledge, scientific output and scientific enterprises are leading resource which possesses decisive significant in the field of general development and especially in economical development.

The world experience shows that scientific and technical progress is essential factor to eliminate social and economical reforms, crisis and stabilize economy. On this point, issue of increase of role of science is particularly agenda to renovate products and increase scientific and technical potential for countries transition market economy.

In fact, in the transition to a market economy, none of the countries in the former Soviet Union were scientific and technical progress, not just at the level of economic development. Changing ownership relationships and directing the financial sector to economic reform has highlighted important challenges such as the development of national science, which provides technological refinement of production and the production of competitive products (*Bapavaa*, 2007). The scientific technological factor has almost completely been excluded from the reform list of the economy. The result of such a policy has led to the escalation of the technological crisis, the decline in production, the loss of domestic and foreign markets, and increasing technological dependence on foreign countries.

Of course, it must be taken into account that Azerbaijan, which has embarked on its own path of independent development, has a nation-wide complex of industries, with different levels of development of the industry and scientific-technical fields, as well as other states of the union. All of this, undoubtedly, allows to predetermine the potential of Azerbaijan and prospects for the development of national scientific complexes. The world experience shows that, regardless of the size and the natural environment of each state, the technological innovation and socio-economic progress of each state should develop at a fairly high level. This level is determined by the political and socio-economic aspects of science in general in the economy and the development of society. The level of scientific technical progress should not only be sustainable, but also sustainable. Otherwise, the innovative foundation for socio-economic progress will weaken.

At present, the status of science in the Azerbaijani economy is directed to the tendency in the world system. In developed countries, science is viewed as the key to modern economics: innovations are a source of economic growth, science is a priority over the state's activities and other areas, and the dynamics of scientific costs surpass GDP growth. During transition to economic relations, the scientific and technical potential has not only been focused on, but has been subjected to collapse. As a result, the scientific and technical field in the country has led to a deep crisis that can also be considered as the following: unit technological space was divided into scientific and technical complexes after USSR collapsed; centralized planned system guidance had never thought of equal-strength and self-supply opportunities of the countries included the alliance; large scientific and research and invention centers were placed in Russia, Belorussia and Ukraine; Scientific-technical complexes for the republics such as Azerbaijan, Georgia, Armenia, Kazakhstan and Uzbekistan were aimed at solving minor problems that were highly specialized; there were not raw materials in countries with raw materials such as Turkmenistan and Tajikistan, the scientific direction was almost completely absent. Thus, the scientific academies of national sciences conduct research only on various subjects of fundamental science.

Theory and literature review

Actual scientific knowledge is a classical social blessing. It is a base of innovation. In addition, it is an essential component of our economy in applied way.

It should be emphasized that data and information is an essential component in formation of scientific knowledge and its main product. In other words, they are both incoming and outgoing (*Arrow, 1962, p. 618*). However, complete knowledge is broader, shorter and cumulative (*Mayr, 1982, p. 23*).

Science and concept of science were come across before Aristotle. In certain periods it appeared in Roman language. Use of this concept in English lasted till 1600 and accepted as synonym of *knowledge*. Initially, it referred to natural, obvious knowledge in comparison with intuitive knowledge. It was called a natural philosophy in English. The deductive method was preferable.

With the new essence of the "natural philosophy" of science, a new word was demanded for practice and experiment. William Wavell the professor of Cambridge University suggested the term of *science* in 1834.

We should note that exchange among people is not satisfied only with economic sphere. This, of course, also led to the exchange of knowledge and, in general, a scientific revolution in Europe.

One of the famous economists Romer made several important researches during 1980-1993 years. In his works he based on that the long-term growth was first of all stipulated by the knowledge's accumulation. He applied to the idea of *Powell (1886)* and considered as "the first necessity of capital".

In the second decade of the XXI century scientific-technical progress is one of the decisive factors in removing the crisis phenomena of the economy in stabilization of socio-economic reforms. Many of the problems now facing humankind can be solved only if we approach science more holistically (*Kananaskis Village, Alberta (Canada), 1998*).

Developments in science and technology are fundamentally altering the way people live, connect, communicate and transact, with profound effects on economic development. (*Lee-Roy Chetty, 2012*).

From this point of view, updating of production and enhancing the role of science in scientific and technical potential for the transition to market economy countries increasing problem is particularly acute. In reality during the transformation to a market economy none of the states of former Soviet Union was factor of the

economic development. As important issues: the changes of economic reforms ownership and technological update the direction of production in the financial sector and the national development of science for providing production of competitive products were in the second plan. We can say that the scientific-technological factor was removed completely from the list of economic reforms. As a result of such policy it has led to aggravation of the technological crisis, decrease in production loss of domestic and foreign market, dependence on growing technologically from foreign countries.

Research methods: theoretical and empiric methods were applied, information was realized, induction and currently methods were treated in this article. All science literature, official documents, the results of activity in this direction is studied. Correlation and regression equation structured according to the mathematical economy methods and dependents among variables are determined.

The development of science in the world

Scientific and research activity in the world experience is regarded as scientific and technical development indices in the country. Also, the total number of scientific articles published in the scientific journals included in the scientific citation index system, such as Sciences Citation Index (SCI) and Social Sciences Citation Index (SSCI), is calculated. As a source of information it is accepted the US National Science Foundation and Thomson Reuters scientific statistical database of the international scientific organizations. Studies of scientific and research work covers the following areas: Earth Science, Astronomy and Cosmos, Mathematics, Physics, Chemistry, Biology, Medicine, Psychology, Sociology Technics and Technology, Mechanical Engineering, Agricultural Science. Indicators of research activities of the world countries are published in the special report of Science and Engineering Indicators of the US National Science Foundation.

These reports, which have been renewed from time to time, are ranked according to the level of research activity published in the above-mentioned journals. A list of world countries based on the 2011 data was published in 2014.

The given typology is focused on two groups:

1. Resource indicators of science:
 - a) number of engineers and constructors for per 1000 population;
 - b) SREDW costs for per capita of the country (the USA dollar);
 - c) SREDW costs for per investigator (the USA dollar);
 - d) share of financial deduction of SREDW in GDP of the state (in %)
2. Effect indicators of science:
 - a) number of scientific publication for per 1000 of population;
 - b) number of scientific publication for per 1000 of engineers and scientists;
 - c) number of submitted resident patent application for per 1000 population;
 - d) number of submitted resident patent application for per 1000 of scientists and engineers;
 - e) share of high-tech products in total exports of the country
 - f) number of computers for per 1000 of population

Use of relative indicators enables to compare certain big and small countries and also to classify them according to the types of progress level of science.

20 countries include in group of countries with high-progressive science (I group). Among them the USA, Japan, Germany, Great Britain and France are giant countries in this field.

They have high absolute and relative costs (80% of global spending) for SREDW, a large number of employees, a high level of private participation in financing and research, a low share of government, scientific and technological achievements and a stable leadership in discoveries. Although those countries belong to the same groups and possess almost same relative indicators, they can be divided into 3 subgroups:

- a) this group includes countries with high resource costs and high scientific rationality: Sweden, Switzerland, Japan, the USA.
- b) this group includes countries with high resource costs, rather low scientific rationality, where costs exceed income: Germany, France, Israel.
- c) this group includes countries with high scientific rationality and not much resource indicators: European countries (Netherlands, Denmark, Finland, Belgium, Ireland, Norway), also the Great Britain, Canada, Australia, New Zealand, Korea, Singapore.

Countries with medium level science progress are entered in II group. It includes Western European countries (Italy, Spain, Portugal, Greece), Eastern European countries, CIS countries, some countries of Southern, Southeast and Eastern Asia, Southern and Central America. Most of them are in the stage of establishment of new national scientific schools in science and research area. Financial difficulty in these countries confined scientific research opportunities and scientific progress in SREDW stage. Financing is realized thankful to the state exceeding private sectors. This group can also be divided into 3 subgroups for indicators of medium progress of science:

- a) It includes countries with the same costs and scientific rationality indicators. There include countries: In countries such as Czech, Spain, Slovenia, SAR, Romania, Bulgaria, Mexico, Argentina, Chili, Turkey classic science (nature-oriented research that does not require large amount of financial resource) covers structure of SREDW.
- b) This group embraces countries with medium costs indicators and rather low scientific rationality. The list includes Poland, Croatian and Ukraine. Nowadays countries come across with low financing, reduction of scientific and technical potential and “brain flow” in the direction of scientific progress.
- c) This group includes countries with medium and low costs and high scientific rationality. There are 4 countries in this group: Hungary, Slovenia, Thailand and Philippine. Its assessment particularity is due to low resource supplement for science to scientific research possessing descriptive character. This kind of researches does not require much costs, however rationality can be high thankful to publications. Therefore, in the comparison between “costs”/ “product” these countries tend to “product”, consequently it affects their place in the world of science in the world.

III group. Countries with low scientific progress. There are 12 countries in this group: India, China, Tajikistan, Uzbekistan, Vietnam, Uruguay, Ecuador, Egypt, Bolivia, Nigeria, Sri-Lanka, Ben cover 2 subgroups.

- a) This group include countries engaged with highly financed scientific product but with rather low indicators. China and India are in this group.
- b) Other group of countries with very low financing and lack of scientific and technical personnel, undeveloped scientific infrastructure. Scientific researches in this type of countries are done via support of state budget or foreign sponsors and this finance is mainly spent on agricultural areas and mining work.

The development of science in Azerbaijan

International experiens shows that teritorial size, regardless of the natural conditions of each state, its economic and social progress in the source of technological innovation and assimilated technology needs enough high level development. This level of science in the economy and the development of society, political and socio-economic directions are determend.

For every nation to get developed, the application of both science and technology has to go hand in hand (Samiksha S. 2015). The level of obtained scientific technical progress is not only sustainable including constantly must be developed. Otherwise the innovation foundation of socio-economic progress will be weakened.

Embarked on the path of independent development Azerbaijan, as the other states of the former Soviet Union had complex national economy developed different levels in the field of industry and scientific-technical areas. Of course all this allow to determine potential of Azerbaijan and prospects of development in the national research facilities in advance.

Currentli the science status of Azerbaijan economy is directed towards the world system tendency. In developed countries science is regarded as the key of modern economy: innovations are considered as the source of economy growth, the activity of the government and is the priority over the areas, dinamyc of scientific spendings follows the GDP growth rate exceed. It was not paid much attention to the scientific technical potential in tranzition period of economic relations , even it was destructed. As a consequence of it, it has led to deep crisis situation in the scientifically technical sphere in the country.

Let's take a look at the dynamics and proportion of other indicators of funds allocated from the state budget for scientific research in our country during the year.

Tables. Dynamics of main indicators of scientific and research issues

Science system of the world is very dynamic in terms of time and space.

Gradually, progress and degradation of states in the field of science leads to change of their scientific status in the world community. This situation can be seen in the case of Azerbaijan. While studying the key indicators of science in the country in 2005-2015, it was determined that the number of research and development organizations increased from 136 to 141 during 2000-2015. During that period the number of personnel engaged with research and development increased by 1,52 times compared to 2000, 1,37 times compared to 2005, almost remained stable 1,38 times compared to 2010, also number of Doctors of Science in 2015 increased by 2,35 times compared to 2000, 2,29 times compared to 2005, 1,85 times compared to 2010, number of Doctors of Philosophy increased by 1,95 times compared to 2000, 1,96 times compared to 2005, 1,83 times compared to 2010. In addition, the number of scientific and pedagogical workers working in higher education enterprises, who are not enrolled into personnel but engaged with research and development, has decreased. The decrease in 2015 was 0,06 % compared to 2000, 0,15 % compared to 2005, 0,05 % compared to 2010, also the number of Doctors of Science among them during that period in 2015 decreased by 1,15 times compared to 2000, remained unchangeable compared to 2005, 0,09% compared to 2010, the number of Doctors of Science increased by 1,06 times compared to 2000, 1,01 times compared to 2005, 1,10 times compared to 2010. State budget allocated to science in 2015 increased by 12,11 times compared to 2000, 3,93 times compared to 2005, 1,21 times compared to 2010, net weight of GDP remained stable 0,2 percent, net weight of costs of state budget slightly decreased, domestic costs allocated to research and development in 2015 increased by 7,62 times compared to 2000, 4,39 times compared to 2005, 1,31 times compared to 2010, net weight of GDP remained stable 0,2 percent, main

funds used in research and development in 2015 increased by 2,08 times compared to 2000, 1,42 times compared to 2005, 1,17 times compared to 2010 (26).

Result of research

Lets look through the mutual relations among science indicators:

$$Y_{YYETi} = 15,9138 - 0,00106453 X_{TIMHS} + 1,14657 X_{DBEÇX}$$

(0,5013) (-0,5285) (9,0010)***

$$R^2 = 0,988294; DW = 1,774998 \quad (1)$$

$$Y_{YYETi} = 34,9187 - 0,00178049 X_{TIMHS} - 0,19723 X_{TIIÖV} + 1,24058 X_{TIŞÜX}$$

(1,2313) (-0,8860) (-0,8341) (10,0103)***

$$R^2 = 0,993607; DW = 2,120417 \quad (2)$$

As the statistic significance is little in basic facilities used in research and works is removed and a new equation is obtained.

$$Y_{YYETi} = 34,3379 - 0,00247932 X_{TIMHS} + 1,19742 X_{TIŞÜX}$$

(1,2601) (-1,4120) (11,0622)***

$$R^2 = 0,992125; DW = 1,875425 \quad (3)$$

Note: * $p \leq 0,1$; ** $p \leq 0,05$; *** $p \leq 0,01$

YYETİ	—	Carried out the volume of scientific technical research
TİMHS	—	The number of staff dealing with the research and works
DBEÇX	—	Expenses spent for science from state budget
TIŞÜX	—	Toatl expenses for research and works
TIIÖV	—	Basic facilities used for research and works

It is clear from obtained equation, all structured three economic mathematical dependence R2 is selected correctly. But all three economic mathematical dependence the statistical significance number of the staff dealing with research and dependence is low ($p \leq 0,1$; $p \leq 0,05$; $p \leq 0,01$ is not paid) and neqative sign.

It shows that the role of number of staff dealing with the research is lower in executed scientific technical works for objective reasons. It is explained as follows: 1. Their potential is not fully used; 2. In order to realise their potential the favourable environment, conditions and initial capital are not at the same level; 3. Application of obtained and will be obtained scientific achievements, inventions are very weak in strong competiton in globalization and international free economic conditions.

At the same time although in equation (2) the volume of basic facilities are many but as a result of not using fully the statstic significance of this factor is low and negative sign. For this reason it was removed from next equation.

So, For any successful economy, particularly in today's quest for knowledge based economies, science, technology and engineering are the basic requisites (Samiksha S. 2015).

In broad terms, there are two possible goals for engaging the policy process and two primary strategies for achieving those goals. The goals are either to improve policies that affect science (policy for science) or to improve policies that can benefit from scientific understanding (science for policy) (*American Meteorological Society. 2006*).

Finally, I hope the decree Strategy Road Map which was signed by president of Azerbaijan Republic in december, 06, 2016 covered the 11 sectors of economy will direct to increase the indicators of our research too.

The Role of Translation Studies and Translation Theory in the Far East

Mehmet Cem ODACIOĞLU¹

¹ *Bartın University Dept. of Translation Studies*

Email: cemodacioglu@bartin.edu.tr

Abstract

The translation activity, which began to transform into a discipline with James Holmes's, seminal paper entitled "The Name and Nature of Translation Studies" in 1972 has increasingly established relationship with such disciplines as linguistics, literature, sociology, philosophy, anthropology, archeology, and so on. In terms of this relationship between Translation Studies and these disciplines, this academic field of study has also evolved into an inter-disciplinary branch of science over time. As a result, scholars have introduced many different theories and approaches under linguistic, cultural, sociological and technological revolutions and turns within TS. The foundations of translation studies have begun to be established in this way. Upon considering overall TS literature, one can see that most of the translation theories and approaches are actually western-centered. In fact, it may be because the West is in a sense more advanced than the East in terms of scientific developments. But did only the Western approaches have an impact on the translation in terms of its gaining a scientific status? What is the position of far eastern countries like China on translation and translation studies? What is the contribution of both west and far eastern scholars to the far east in the advancement of translation studies? Have the far eastern scholars ever put forward any theories or approaches to contribute to the translation process, its function, and production, like their counterparts in the west or have they at least conducted studies in this respect? In this geography, what kind of translation problems do scholars deal with and what are the similarities and differences between East and West? Based on these questions, the study questions the place of translation studies and translation theories in the far eastern countries such as China and makes a scrutinization on how they are received in these geographies. It is hoped that this study will contribute to the emergence of new paradigms in order to support the progressive structure of translation studies in parallel with the translation needs in the far east.

Key Words: Translation studies, translation theories, translation approaches, far east, China.

Introduction

Thanks to the American / Dutch translation scholar James Holmes's seminal paper entitled "The Name and Nature of Translation Studies" held in Copenhagen in 1972 and presented at the International Linguistics Congress the translation activity, which has become the tool of communication in at least two different nations and cultures for commercial, sociological, cultural, political and military purposes for many years, has now begun to be considered a different discipline being more than just a linguistic activity. And the name of the discipline is currently defined as Translation Studies or Translatology in some sources. At first, the translation activity was studied under the umbrella of applied linguistics and comparative literature. However, over the second half of the 20th century it has evolved from linguistic turn to cultural, sociological, pragmatic and nowadays technological turn in terms of the relations it has established with linguistics, literature and cultural studies. TS can also be called as an interdisciplinary discipline in terms of its interdisciplinary relationship with even computer technologies¹.

However, it can be quite easily observed that most of the pioneer scientists and translation theorists playing a role in the acquisition of this scientific identity of translation studies are Westerners according to the related works on translation studies in foreign languages and the scientific discourses of translation are developed within this scope. However, there have been many researches and studies in the field of translation studies, especially in the Far East countries such as China in recent years. And within this framework there are some articles, papers, dissertations, books and project-level studies on translation studies. Therefore, the following questions may

¹ See Snell Hornby, 2006; Munday, 2016; Odacıoğlu, 2017.

come to mind at this point: What is the point of view of the Far East countries in translation and translation studies? In which areas and subjects are the studies carried out? What is the impact of the Far East on the development of translation studies?² Have Far Eastern scientists ever developed or are developing theories or theoretical approaches to translation studies? Based on these research problems, the studies of the Far East scientists in the field of translation studies and the approaches of the western writers regarding the translation studies in the far east and their related studies were examined in this paper. And answers to the questions such as how the Far East's approach to translation and translation studies is and how they are defining this discipline have been tried to be found.

Therefore, the method used in this study is document review and descriptive research. It is hoped that the research will fill the gap which we believe to be incomplete in the literature and make a contribution to the field of translation studies in terms of evaluating the point of view of the far east within translation studies. In addition, a bibliography was made in this area by referring to the sources written in the field of translation studies in the Far East. Related sources were given in the references of our study.

History of Translation in the Far East, Translation Theories, Approaches, Translation Strategies and Translation Problems, An Evaluation on Translation Education and Fields: The Chinese Case

As emphasized earlier, researches on translation studies such as translation approaches, theories, strategies and problems remain relatively untouched in the far east compared to research studies in the West. In addition, most of the discourses that are dominant in the literature of translation studies are European-centered³. For example, most of the researches on the history of translation in the case of China are often placed second in new sources. However, George Steiner's 1975 work *After Babel: Aspects of Language and Translation* and Anthony Pym's *Method in Translation History* contains some references and brief information about the history of Chinese translation. In addition, Eugene Eoyang (1993) uses the term "no man's land" to indicate that the history of translation in China has not been sufficiently addressed in Western translation studies (Xia, 2006: 147-148). Xu Hun, a renowned translator and scientist in the Chinese special issue of *Meta* magazine, divides the Chinese translation history into four different periods:

1. The period in which sutras were translated
2. The translation approach in the Ming Dynasty and Qing period
3. The translation approach in the early twentieth century
4. The translation approach during the People's Republic of China (Xia, 2006: 149).

Eva Hung breaks down the history of translation in China into three periods:

1. The period in which the Buddhist sutras were translated
2. Jesuit translation activities at the end of the Ming dynasty period
3. The period in the second half of the nineteenth century, when the Western sources were translated into Chinese, which paved the way for finding out what was happening in the West (see Xia, 2006: 149).

Luo and Lei handled the translation history in three stages in terms of translation practice:

² In this study representing the Far East, the Chinese example was used. However, even only the Chinese example can give information about the general profile of other Far East countries compared to the West, and translation studies can become a matter of interest and enable more detailed research in the case of different Far East countries. For example, thanks to the literature review in the case of Japan, some studies have been identified such as Yukari Fukuci Meldrum's article titled *Japanese Translation Studies: A New Discipline* and Ásdís E. Benediktsdóttir's study called *Japan and the West: A Journey through Time and Translation* (2012), and Judy Wakabayashi's paper titled "Japanese Translation Historiography: Origins, Strengths, Weaknesses and Lessons" and Nana Sato Rosberg and Judy Wakabayashi's book called *Translation and Translation Studies in Japanese Context* (2012).

³ According to Wang, in contrast to Western approaches dominated by European-centered discourses, translators in China conduct studies contributing to world literature in the context of literary translation (Wang, 2015: 46). In addition, European-centered discourses are frequently used by those supporting radical relativism and postcolonialists to criticize non-Western scientists (Fung Chang, 2018: 463).

1. The stage in which Buddhist texts were translated by foreign monks
2. The stage in which Chinese and foreign translators translate these texts together
3. The stage in which Chinese translators undertake the translation process alone (Luo and Lei, 2004: 20).

In our ever-globalizing world, academic research in China in the field of translation studies is now starting to gain momentum and the isolation against the West is now decreasing in this respect. Especially with the interaction of China with the outside world and different cultures, there has been an unprecedented rise in translation studies in these lands. While Chinese translation scholars and translators do not completely turn their back to the West, they tend to constantly learn from the West in the field of translation studies and also play an active role in the development of the discipline with their translation theories⁴, approaches and discourses. However, compared to the West, it can be seen that the Chinese translation scholars and translators are more interested in the translation practice and process, and the translation theories and approaches that they use and apply are mostly translation process-oriented approaches⁵. In other words, Chinese translation scholars and translators prefer to explore the field rather than exploring the different aspects of translation and rather than conducting more research on defining translation from different perspectives (Sun, 2012: 32 and 35). Because the world of Chinese translation studies has established a self-working system. In 1983, Luo published an article entitled “我国自成体系的翻译理论 (“Our Country's Translation Theory of Its Own”). In this article, he mentioned the dissatisfaction with the impact of contemporary translation theories on China. He also stated that the Chinese translation theory has a distinctive character in the homeland and their own theories and approaches are in a unique position in the world of translation and that Chinese scientists should not belittle themselves compared to the West (Zaixi, 2009: 2-3). In fact, Luo, as in the case of European-centered discourses, focused on the Chineseness of Chinese translation theories in order to create a different discourse against the West (cf. Zaixi, 2009: 5). Similarly, Gui stated in 1986 that Chinese Translation Studies should be established. Fang, Sung, and Zhang, instead, have focused on improving the existing translation studies by highlighting the distinctive features of the Chinese translation world (see Zaixi, 2009: 6).

From this point of view, the main goal in the development of translation studies in China can be stated to be the realization of scientists 'and translators' own methods and theoretical systems, and in this context to present a distinctive character of China. Thus, a cultural policy⁶ has to be created and at the same time, answers to translation problems related to cultural and political changes have been sought. For these reasons, traditional Chinese translation theories⁷ tend to have improved and go on improving by taking these points in consideration. Translation theories and approaches in China for centuries⁸ have been based on the trio of loyalty, lucidity and elegance (1889), which Yan Fu⁹ mentioned in the preface of *Evolution and Ethics*, which he translated from T.H Huxley (Sun, 2012: 36).

In parallel with this, arguments alternated between free vs. faithful translation strategies especially in the translation of religious texts in China, like the West for centuries. The arguments of the first translators on these

⁴ Chinese translators tended to produce translation theories from their translation practices (Luo and Lei, 2004).

⁵ They can also be considered as individual-centered approaches. The process is carried out by the individual (Hee Kim, 2009).

⁶ Chinese scientists conducted extensive research into translation studies in China by focusing on cultural studies, intercultural communication, and cultural linguistics. And the widespread cultural philosophy in China has had a significant impact on translation studies. In addition, traditional translation studies should be considered in a closed, synthetic and inter-disciplinary system in the case of China (see Xia, 2015: 2901).

⁷ At this point, the question can come to mind as to whether translation process-oriented Chinese Translation Theories, can become a paradigm just like the Western Translation Theories. While it is necessary to carry out a detailed research to answer this question, it can be claimed based upon the information in the text that the methods and strategies followed by Chinese translators in the translation process can be evaluated within the scope of translation theories and these approaches are a paradigm as long as they are scientific as mentioned here.

⁸ Another translator Xuan Yang (602- 664) translated Buddhist texts from the Sanskrit and contributed to Chinese culture, literature and language. Xuan Yang applied a number of approaches in the translation process such as omission, changing, splitting, joining, borrowing, adding, etc. (Mei, 2003).

⁹ What Luo and Lei stated are mentioned in the third stage of Chinese translation process.

approaches can be seen as the beginning of the translation studies (yi xue) in China. Apart from this translation phase, which was mentioned by Luo and Lei as the first stage¹⁰, Dao Ann's¹¹ reflections on “Wu Shi Ben”(the five cases in which the meaning of the original text was lost¹²) can be seen as the first approach in China within TS. By pointing out the cases when the original text should not be translated, Hsuantsang was the first to mention the issue of “untranslatability”. Fa Yun reflects his ideas on naturalization and alienation in the preface of his book *Collection of Translation of Sanskrit Names* (Luo and Lei, 2004: 20-21).

The second phase, which Luo and Lei indicated, began with the arrival of the Italian missionary Michael Ruggieri in 1580 on the Canton coast. This period lasted 200 years and the translation of Buddhist texts has been replaced by the translation of texts of Christianity¹³, and texts of science and technologies. While the missionaries were in China, a total of 300 works were published, of which 120 were on science and technology. Chinese translators who work with foreign missionaries to translate technical and scientific texts include Xu Guangqi (1562-1633), Li Zhizao (1565-1630) and Li Tianjing (1579-1660). Xu Guanqi is an important translator who introduced Western science to China. According to him, one must be informed about Westerners in order to catch up with them. Therefore, the works of Western writers need to be translated. However, translations have failed due to the traditional understanding of that time (Luo and Lei, 2004: 20-21).

The third stage began with the opening of China in the middle of the nineteenth century against the imperialist Western powers. The intellectuals in China, a country which was invaded by the West have understood that their country was no longer the only central kingdom in the world, and they therefore began to obtain information from the Western countries in order to strengthen their nations. The first translations included social and military texts to this end. Then the literary translation began to develop. In this way, Chinese intellectuals have had easily access to Western culture and new ideas. Famous translators of this period include Lin Shu (1852-1924), Yan Fu (1853-1921) and Lu Shun (1881-1936). Lin Shu, who lacks a foreign language competence, has written countless literary texts in Chinese, based on what he heard from the interpreters having rendered the western sources for him. Thus, Daniel Defoe's *Robinson Crusoe*, Charles Dickens' *David Copperfield*, Alexander Dumas' *a Dame and Cornelias*, and Miguel Cervantes' *Don Quixote* were translated into Chinese (Luo and Lei, 2004: 21-22).

In the twentieth century, Yan'an Foreign Languages School was opened in 1944 to train translators and interpreters in the fields of political, military and foreign relations. This school is the first of its kind in that the first official translation courses in China are given there (Luo and Lei, 2004: 23).

However, it was only in the 1950s that it became mandatory for translation studies in China to realize a theoretical breakthrough. Dong Qiusi¹⁴ suggested in his article titled “Lun fanyi lilun de jianshe” (“On the construction of translation theory”) that translation studies could be a discipline and claimed that China had a long history of translation practices despite its systematic lack of theoreticalization., Tan Zaixi also stated that China was not at all behind other countries in the 1950s during the first structuring of translation studies. In fact, Qiusi's claims have attracted everyone's attention, and the idea that translation research in China might be even

¹⁰ These stages are briefly mentioned in three steps above in order to see the translation process in Chinese translation history.

¹¹ Dao Ann is a cleric and translator who translates Buddhist texts into Chinese through translation (<https://www.britannica.com/biography/Daoan>)

¹² These five cases are as follows: translation should not be done on condition that the original text is a text that should remain confidential (for example magical books), and that the word in the original text is vague, that the equivalence of word in the source language does not exist in the target language, and there is already any transliterations that have already been rendered and accepted in the target language and there is no formal equivalence between the source and the target text, (Mei, 2003: 61).

¹³ An example from the current literature on this is: Toshikazu Foley in *Biblical Translation in Chinese and Greek* (2009)

¹⁴ In China he is the first person to consider translation as science (Luo and Lei, 2004).

more advanced than the West has emerged. However, as China has entered into a major social, political turmoil¹⁵ and due to the break-up of intercultural links that have begun to develop recently, developments in translation studies have decreased and China has lagged behind the West. From the 1980s onwards, a period of self-criticism has begun and some of the leading sources of both linguist and translator scholars such as Nida, Newmark, Catford were introduced to the world of Chinese translation studies by adopting a modest approach to translation studies in the West. With this process, works have been started to establish an independent discipline in China. In 1987, accordingly, *the Chinese Translators Journal* launched a heated debate on the status and importance of translation studies. (Sun, 2012, 36-37).

Following the introduction of Nida, Catford, Newmark in Chinese translation studies, the translation theories and approaches of Bassnett, Lefevere, Hermans, Even Zohar and Toury, who are among the other famous translation scholars (e.g. polysystem theory, manipulation theory, norms, feminist criticism, as well as the post-colonial translation theories) entered into Chinese translation studies. Most of these theories, however, have not been applied in practice and criticized in China. The reason for this is that some of the translation theories and approaches would not work in the real-time translation process (cf. Sun, 2012: 38-39).

At the 1987 symposium, Zhou Qingbo, Li Ding, Chu Xiao, and others discussed how to build Chinese Translatology in a psychological and philosophical way. In another symposium held two months later after the symposium in 1987 Liu Miqing, Tan Zaixi, Fang Mengzhi and others dealt with the same topic by using linguistics, social semiotics, communication researches etc. and they tested their findings in terms of theoretical applicability of translation to be accepted as a science. In 1990, Liu Miqing published a work titled *Studies on Translation Today*. However, it can also be stated that Chinese scholars have benefited from linguistic theories in the theory and practice of translation. Wang Bingqin (1987) also published the first academic article related to this. The aim of Bingqin was to investigate and uncover the rules about the internal structure of a text under the light of text linguistics. All samples of Bingqin, who analyzed many texts through textual analysis, were depictions and quotations from the books of famous scientists. As he did not analyze such texts as dialogue and so on, Bingqin could not find more examples for his research, and his research was largely limited to the Classical Chinese rhetoric approach (Luo and Le, 2004: 26).

Scientists like He Ziran have also conducted pragmatic research in translation. In his article published in 1992, Ziran proposed concepts such as pragmatics- linguistics and sociopragmatics to investigate the pragmatic effect and use of language in the field of translation. Discussing the possibility of applying a pragmatic approach between the source and target text, Ziran's aim was to create a pragmatic equivalent effect between the two texts. Ke Wenli (1992) also carried out a wide range of research into semantics and pragmatics. Only in this way, understanding and explanation in the translation could be provided and problems in the translation process could be solved. In addition, it can be said that Luo Xuanmin's research on the textual level of translation is an important effort in dealing with translation problems. According to him, there are two translation units. The first is transfer; the other is for analysis. Thanks to this approach, an efficient response can be given to the question of "What is the translation unit?". In fact, linguists / translation scholars such as Nida and Barkdurov could not find an answer to this problem (Luo and Lei, 2004: 27).

In parallel with these, it is also observed that some scientists state the integrated use of Chinese and Western translation theories¹⁶ in order to increase the developmental potential of translation studies. According to this,

¹⁵ Cultural Revolution (see also Luo and Lei, 2004).

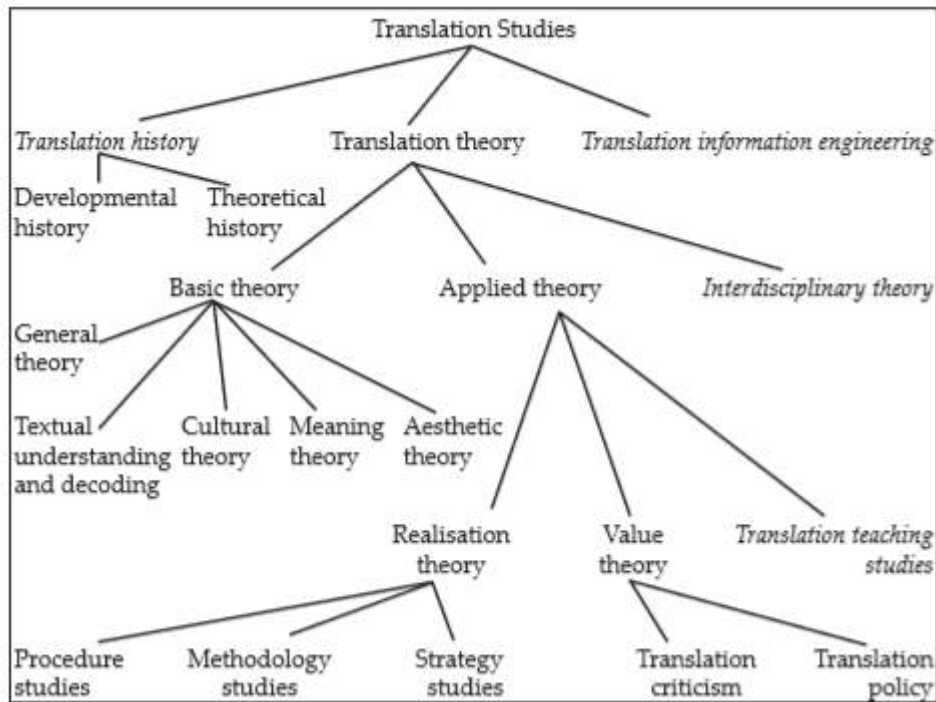

¹⁶ Pym's (2014) book entitled *Exploring Translation Theories* discusses in detail the Western translation theories and approaches.

translation studies in China may be more possible by reinforcing both Western and Chinese translation theories¹⁷ (Sun, 2012: 40)¹⁸. For this purpose, researches on post-colonial translation theories and approaches were introduced to the world of Chinese translation studies. The translations of the works of Western translation scholars such as Michael Foucault, Gayatri Spivak, Sherry Simon and Lawrence Venuti were published in 2001 in an anthology called *Yuyan yu fanyi de zhengzhi (Language and the Politics of Translation)*. From the 2000s on, trending topics such as feminist translation theories, gender in translation¹⁹ and so on have begun to show a great reception in the literature of Chinese translation studies. There are more than 200 books in the literature of Chinese translation studies including the translations of foreign sources²⁰. Some of these are translations of Western sources. (Sun, 2012: 44-45).

In addition to these developments, Zhang Meifang also commented on Holmes's Translation Studies in the light of translation studies in China and expanded his research on Descriptive Translation Studies and Applied Translation Studies. In addition, Liu Bgqin published a work called *Translation Teaching: Practice and Theory* (2003), making Holmes's current map more detailed:

Figure 1: The reinterpreted version of Map of Holmes by Liu (Youlan: 2005: 190)

It is to say map

possible that this was

¹⁷ In the literature, there is a specific theory of translation put forward by Qian Zhongshu ("Theory of sublimity"). This theory provides specific tools for achieving this goal by providing an ideal aim in the field of literary translation against the theory of loyalty, which is the traditional Chinese paradigm. Zhongshu has developed a solid / comprehensive theoretical basis by examining the theory, nature, function, practice, and artistic characteristics of ideal literary translation, based on Chinese translation theories and practices, in the context of comparative research. Thus, he broke the classical loyalty approach by aiming the literary translation to follow the artistic one. For detailed information about the theory, it can be referred to the articles included in the references (Chengfa, 2007).

¹⁸ In 1996, the first symposium on Translation Education was held. More than 100 trainers and translation graduates gathered to discuss how translation studies could be improved (Luo and Lei, 2004: 23).

¹⁹ An example from the current literature: Mengying Jiang's article entitled "Female Voices in Translation: An Interrogation of a Dynamic Translation Decade for Contemporary Chinese Women Writers, 1980–1991" and Zhongli Yu's book called *Translating Feminism in China: Gender, Sexuality and Censorship*.

²⁰ Roberto A. Valdeon's study called *Chinese Translation Studies in the 21st Century* (2017), an example of translation studies in China, was published by Routledge.

reinterpreted by Liu in the light of the history and the needs of the Chinese translation studies and also the translated fields. In addition, according to Luo and Yei, China has nowadays been rapidly modernizing and opening to the outside world and adopting an economic reform policy. In this respect, as in other disciplines developing in China, the importance of translation studies is also rapidly increasing, because it is not possible to communicate across cultures in a globalizing world without the presence of translation. For these reasons, translation courses are very popular in Chinese universities, and translation is a process that many scientists and graduate students constantly apply (Luo and Lei, 2004: 20).

In addition to the evaluation of these points in translation studies in China, it can also be argued that translation education has reached a different dimension than in the twentieth century. To this end, Lei provides up-to-date information on the status of translation education and discusses the importance of translation, teaching materials, and training of the trainer. As a teaching method, Lin Zhang distinguishes translation from translation as a teaching goal, suggesting that students should know about translation theories and translation strategies. Similarly, other translation trainers also work on testing, teaching materials, and interpreter education (see Luo and Lei, 2004: 24). It should also be noted here that Dong mentioned the Chinese translation competencies that shape the translation training. These can be listed as follows: 1- Language-discourse-pragmatic competence 2- Cultural competence 3- Strategic competence 4- Instrumental competence 5- Thinking competence and finally 6- Personality in systematic coordination (Dong, 2017: 39, cf. Wang and Wang, 2008). This model has been developed based on Western translation skills and is similar to the PACTE model (2005). Jiang and Quan (2002) also refer to a sub-competence known as aesthetic competence. According to this, an individual with an aesthetic sense has the capacity to achieve image perception, perception of integration and other psychological mechanisms in relation to aesthetic thinking power. The idea of aesthetics competence is based on the work of Liu in 1987 (Dong, 2017: 39-40).

Another point to be mentioned about translation training is the discussion of issues related to translation education and theories and the discussion on issues such as the translation training program design, the content of textbooks, and the training of trainers in the translation education symposium held in Hong Kong in 1997. The result is that the theories of translation education in China were still far from philosophical thought and practically weak. Translation studies should be carried out on a descriptive, theoretical and practical basis for these reasons. In addition, the research conducted should be carried out on a scientific, artistic and analytical synthetic level. It is also necessary to make detailed research on translation rules and translation skills and to make new researches in order to reach new findings in terms of translation method and translation history, only in this way the translation practice can be improved and the quality issue, which is one of the biggest problems of today, can be improved (see also Luo and Lei, 2004: 24).

Upon taking a look at the articles, books, papers and projects of Chinese translation scholars and translators, in which they work as a coordinator or as a researcher, as mentioned above briefly, it is also observed that the translation fields encompass feminism, postcolonialist period, literary translation (such as poetry translation, rhetoric), computer technologies, machine translation technologies, localization (especially game localization²¹), etc²². All these movements, as Chesterman has pointed out, contribute to the development of translation studies in a universal level as well as the situation and reflections in the West (see Chesterman, 2014: 83).

²¹ Minako O'Hagan and Carmen Mangiron's book (2013) titled *Game Localization Translating for the Global Digital Entertainment Industry*.

²² Sin Wai's article called "Approaching Localization" (2013) and his book entitled *The Routledge Encyclopedia of Translation Technology* (2014)

Conclusion

In this study, the status of translation theories and translation studies in China and the different views of the Chinese world on this issue have been handled through examples of translation practices, approaches, strategies and theories. And it is observed that although the world of Chinese translation studies has not completely turned its back to the West, it follows the literature of Western translation studies, but it also reflects its own theoretical and individual approaches in translation. In other words, some scientists and translators have criticized the reception of only the western translation theories among the contemporary theories of translation, emphasizing the 'Chineseness' of Chinese translation theories. Some have also adopted approaches to integrate the West and the Far East, while others have exhibited their experience in the translation process. At the end of this study, it can be stated that answers to the questions such as what is happening in the world of translation studies in the Far East?, what is the status of translation studies in these lands?, is there a contribution of Chinese translation studies and translation theories to general translation studies? Etc are thought to have been given. In fact, in order to maintain the inter-disciplinary structure of translation studies and to keep this field dynamic, it is better for both the Western and Far Eastern translation scholars and even translators to work together and also to share the theories and approaches they produce with each other in the conferences and symposiums rather than to impose them on each other. Last but not least they also need to make discussions about the results of which theories should be employed and in which context.

Recommendations for Translation Students on Subject-Matter Specialization in Translation Based on Views of Experts

Fadime ÇOBAN¹

¹*Bartın University, Dept. of Translation Studies*

Email: fcoban@bartin.edu.tr

Abstract

During the translator education, students are expected to have a bilingual and cultural competence, as well as gain a subject-matter specialization in their fields of interest. However, the concept of specialization is often used in a wide sense within translation studies. As a result, there are many areas that can be classified as a field of specialization among thousands of specialized areas. Thus, it is necessary to redefine the concept of subject-matter specialization in translation, to describe the path to specialization in any field in translation and to make students of translation studies well aware of the course of the specialization process. At this point, such questions arise: should the courses on subject matter specialization be offered by the professors of the field, or by translation academics who have translation competence and theoretical knowledge of the field but do not have any experience in the market on these fields of specialization or do not graduate from related departments to gain specialization on these fields? Or should professional translators who work in the field offer these courses? Thus, the aim of this study is to address the topic of subject-matter specialization in translation under the light of above-mentioned questions and to make recommendations particularly to the translation students for their courses on specialization. In this respect, the views of professional translators in the market as well as the academicians and experts working in the fields of Translation Studies, Philosophy, Archeology and so on were taken in the study and the obtained data were subjected to qualitative analysis.

Keywords: translation, subject-matter specialization, expert views, qualitative analysis, recommendations.

Introduction

In translation and interpreting programs, students are expected to develop language and culture skills throughout their undergraduate program, as well as to attain their subject-matter specialization in their fields of interest, and this is especially essential upon taking market conditions into account. However, thanks to the research, it has been found out that the concept of specialization is often used in a wide sense in the literature.

The aim of this study is to reconsider the concept of subject-matter specialization in translation. However, in reconsidering the concept, first of all, it is important to describe the course of the specialization processes by describing the ways in which translation students specialize in any field of translation. Some questions may come to mind at this point: should the courses on subject matter specialization be offered by the professors of the field, or by translation academics who have translation competence and theoretical knowledge of the field but do not have any experience in the market on these fields of specialization or do not graduate from related departments to gain specialization on these fields? Or should professional translators who work in the field offer these courses?

In the light of the above-mentioned objective and in the light of these questions, some recommendations have been made through the expert opinions, especially to the translation students, in order to understand the concept of specialization more clearly. Accordingly, the data were obtained through the expert opinions of the academicians in the departments of Translation Studies, Philosophy, Archeology and so on. and from the experts working in the language sector and also both translators and interpreters who provide professional services in the market and then the data gathered were subjected to qualitative analysis.

In the evaluation of the data, qualitative analysis and recommendations form the core part of the study, while the first part focuses on the areas of expertise, specialization and subject area specialization in translation. Thus it eliminates uncertainties in order to support the second part.

The concept of subject-matter specialization in translation, specialization and fields of specialization

The concept of specialization is defined according to the Cambridge dictionary as “*a particular area of knowledge or the process of becoming an expert in a particular area*”¹. In another source, the concept is defined as the individual's experience and accumulation in a specific field of knowledge (see Teodoridis, Vakili and Bikard, 2017). The concept can also become more clear by analyzing the definition of specialty language developed by Öncü. According to him, the specialty language is different from the common language and the specialty language has special terms and a certain syntax (Öncü, 2013: 78).

Upon examining the different definitions of the concept in the light of the above explanations, it is observed that the content is quite comprehensive. Upon using the concept in a wide sense in translation education, it will not be wrong to mention thousands of specialized areas that will not actually fit into an education curriculum. Therefore, it is difficult or even impossible for translators and interpreters to master thousands of specialized areas in a four-year training program or to present these fields to students even at the introductory level. In the courses, it is aimed that only some specialized areas that will be useful for the translator or interpreter after graduation can be introduced (such as economics, press, medicine, law, software / web / game localization, literature, technical fields, multimedia texts², tourism texts, audiovisual translation, advertising texts, human texts³, etc.) and some translation activities may be carried out by students so as to make them familiar with those fields of specialization.

At this point, it is worth mentioning the difference of expertise and specialization. Because expertise is an endless process and it is continuously acquired. As in other professions, translator students increase their expertise knowledge even after their graduation after receiving the necessary specialist training in the translation program, in the institutions and environments where they work or even with their own individual efforts and experiences. The stage in which expertise knowledge is continuously increased and improved can be mentioned as specialization or specialization process. This process starts during the translation education and continues for four years and continues even after graduation.

The area of expertise in translation, which begins during the translation training, is based on the experience of the translation students in a particular translation field through the translation of different texts and the acquisition of specific terms and jargons⁴. For this reason, it is necessary to distinguish the concept of field expertise from the general concept of translation. Parallel to this, according to Roberts, field expertise in translation differs from the translation of a general text because it consists of terms specific to that field⁵ and requires expertise in a particular field. In addition, Roberts categorizes specialized texts as scientific-technical, socio-economic and political texts. Because these texts require more intensive knowledge than other texts in the general category. (Roberts: 1988: 73). For example, the translation of an everyday dialogue can be an example of a general translation.

⁴ Cf. Fiola, 2013: 60.

⁵ See also. Postolea, 2016: 56.

However, Popescu and Cohen Vida stated in one of their studies that the translation education aiming to prepare the future translators well-equipped with the necessary skills for the translation market remains too traditional and that the translation competence mostly covers the general translation. According to them, the specialized texts in translation are constantly changing and increasing due to the today's changing needs. For this reason, the authors stated that this type of translation is an important component in professional translation education and that the translation of specialist texts may have traces of the general translation. However, the main difference is that the translation of these texts requires the translator to conduct field-specific documentation⁶ and terminology⁷ research (cf. Lethuiller, 2003; Popescu and Cohen Vida, 2015: 1195-1196).

In addition, translation trainers should make the necessary effort to enable translation students to acquire the skills such as discourse analysis, critical text analysis, translation text analysis, language competence, cultural competence, cultural intelligence, emotional intelligence, research competence, writing skills, technical literacy, media literacy authorship, digital literacy, field knowledge, subject-matter knowledge and so on, in order to contribute to the process while attaining subject-matter specialization in translation.. (cf. Fiola, 2003: 62 and cf. Sharkas, 2015)⁸.

Specialization courses in translation programs generally focus on linguistics and foreign language competence⁹. And the main point here is ignored. Translator candidates can become only semi-experts in the field of economy, technology, law, medicine, economics, localization, press, technical, scientific and so on. This is generally the method of traditional translation education (cf. Laursen and Pellón, 2012: 45).

However, it is necessary to state that the quality of the education given in translation programs is directly proportional to the effective use of students' creative powers. While it is possible for the students to specialize in a specific subject and text type after graduation thanks to subject-area specialization, it is not enough just to acquire the foreign language competence or to be able to translate the texts in all subjects and types (see Yücel, 2007: 154). Because the translator or interpreter cannot fully specialize in every field. For this reason, it is important for the candidates of translators to specialize in a specific field of translation in terms of the translation quality and a high-quality translation project.

A qualitative analysis of expert opinions on the specialization courses for the students of translation studies and recommendations to the translator and interpreter candidates

In this section, expert opinions about specialization courses have been given and the data gathered were subjected to qualitative analysis and some suggestions have been made in the conclusion section. The questions of should the above-mentioned courses¹⁰ on subject matter specialization be offered by the professors of the field, or by translation academics who have translation competence and theoretical knowledge of the field but do not have any experience in the market on these fields of specialization or do not graduate from related departments to gain specialization on these fields? Or should professional translators who work in the field offer these courses? have been tried to be answered in this way.

⁶ Hradecká, 2010

⁷ Cf. Mellinger, 2019. See also. Benítez, 2009

⁸ See also. Armăsar, 2014 and Paradowski, 2016

⁹ Actually the aim is not gain foreign language competence but to ensure that the foreign language plays an important role in attaining specialization (See. Tosun, Akın and Şimşek, 2015).

¹⁰ Specialized areas can cover such fields as law, medicine, social science texts, press, economics, tourism, philosophy, archeology etc.

Questions to ask experts for specialized courses

- Which field do you work in?
- What would you recommend to young translators to develop themselves in their area of expertise?

Expert opinions

Within the scope of the above questions, 15 participants from the fields of philosophy, archeology, linguistics, social sciences, translation studies, psychology, sociology, English language and literature were interviewed and firstly the comments of the participants and then the qualitative analysis were given.

Participant 1¹¹ (Philosophy Lecturer):

“History of general philosophy is taught in undergraduate education in the Department of Philosophy. However, there are different fields such as history of science, history of philosophy or systematic philosophy and logic during a Master’s degree and PhD programs. And specialization can be realized in one of these areas”.

Analysis: Participant 1 did not fully respond to the answers asked above. He spoke only of his area of specialization and the subjects covered in undergraduate and graduate programs.

Participant 2 (Philosophy Lecturer):

Although I participated Locke classes during my undergraduate studies, I was not able to specialize in Locke in undergraduate studies. I’m only familiar with Locke’s conceptual world. In philosophy, the concept world of every philosopher is very different. My recommendation for translators would be to achieve an introductory level of specialization by taking Introduction to Philosophy course. For example, the concepts inherited by Locke are transmitted from the philosophers before him. To translate a work on Locke, a master’s degree in philosophy on Locke can be pursued. But is this possible for the translator or interpreter? In order to understand any philosopher in the field of philosophy, it is necessary to know the general philosophy of the philosopher. Based upon a text, it is necessary to have knowledge of the general history and the philosophers before it. Because references in the philosophical texts are made a lot. For example, in order to translate Aristotle’s Categories, it is necessary to have an extensive knowledge about Ancient Greek, general philosophy, Aristotle and Ancient Greece”.

Analysis: The participant 2 suggests that each philosopher has a different conceptual world, and recommends that translators take Introduction to Philosophy course. According to him, a master's degree on Locke may be required for the translation of Locke's work. Thus, introductory-level specialization may be possible. However, in order to understand philosophers in the field of philosophy, the participant states that it is necessary to understand the general philosophy of the philosopher and she also stresses there are many references in such kind of texts with an example. Based on the opinions of the participants, it may not be enough to equip the translator or interpreter just with the concepts and terminology related to philosophy in translation education and to carry out translation practices by the translation educator about different philosophical movements every week. In order to render more successful translations in this field, translation students need to take courses from philosophy department (such as Introduction to Philosophy) as elective course and they need to continue the courses in the field of philosophy, and maybe even to get a master’s degree. A lecturer from the Department of Philosophy with a translation competence may transfer his / her knowledge and experience to the translator candidate. However, the lecturer being a translation scholar who is

¹¹ Participants made their comments in Turkish. But as the language of the article is planned to be in English, the author translated them directly without changing the form and content.

interested in philosophy but is not specialized in the field of philosophy, can enable translation students to take interest in the field of philosophy. But in the end, it may be necessary for the translation student to take the next steps himself and to put information on it in different ways in some ways (such as philosophy education).

Participant 3 (Sociology Lecturer):

“There are some basic works. They must be read. Dictionaries are also available. Glossary of Sociology, books on Introduction to Sociology, non translated books written in Turkish in Turkey on sociology can be read. It is important to read basic theories of sociology (theoretical books) and methodological books. In other words, topics such as methodology, theories and introduction to sociology can be classified. First of all, in order to gain familiarity with the field, the glossary of sociology terms and introduction books to sociology can be read. In addition, each author has his own terminology. There may be different meanings that the author imposes on his concepts. This situation differs among scientists. There are different sociology departments. American sociology and studies in Europe, in the West, dominate the field of sociology. For example, it is very difficult to translate Weber and Marx at the same time. Someone who wants to translate Weber should also know European history. In this case, translation can be done on the basis of country or author. For example, in English, there are different words having the similar meaning such as conflict, antagony, or clash. We name all these kind of words in Turkish just “çatışma”. But each of these words is also used in a different context. All this needs attention in translation”.

Analysis: The participant advises the students to read the dictionaries, the glossary of sociology terms, books that are not translated on introduction to sociology, the basic theories and methodology of sociology in order to gain expertise in the field of sociology. He also states that the translator candidates may have to exhibit attitudes according to different schools. Based on the example of Weber and Marx, the participant who asserts that a translator who is to do a Weber translation must know European history also states that the context should be paid attention during the transfer of concepts.

A translator or an interpreter who wishes to specialize in the field of sociology can take the concepts, theories and methods on sociology at the introductory level in the course of translation of sociology texts, and the specialization process can be initiated in this way. However, if the translator candidate does not have any prior knowledge of sociology or has not had any basic training, he/she cannot be expected to fully master the translation of sociology texts at the end of the course. This course can make it possible for the translation candidate to be interested in those kind of texts, and the subsequent process is left to individual effort and willingness to learn.

Participant 4 (Public Translator):

“The concept of expertise is used in a broad sense in “Translation Studies”. This concept needs to be well underlined. A good translator is also called as an expert. Specialization requires professionalization. There is a need for a different concept for expertise in translation. Moreover, there are no stages of specialization that are described in detail in translation studies. There is no answer to questions such as “how to specialize in any field? and what are the stages of this specialization?”.

“We can say that specialization is a process. Expertise is to be able to use translation skills during translation and apply them to practice. There are many areas of expertise such as mining, agriculture, yachting and so on. Maybe over 1000 different areas of expertise. In order to specialize in any field, it is necessary to read the main sources that make up that field. For example, there are resources of United Nations on migration. There are basic resources of

the World Migration Organization. For example, let's assume that there is a translator responsible for an institution working on human rights, law enforcement agency, population and local authorities, As the translator sees writings on these topics in time, he/ she learns how it is called 'detention' or arrest document and learns those kind of terms by working".

"In public translation, specialization may become an issue within the institution. For example, translators of the Ministry of Health, the Ministry of Culture and the Social Security Institution also have specialization in the process unlike a freelance translator who does not have such a right due to the natural conditions of the work carried out. Because a freelance translator has to find customers, translation job, needed documents for translation etc. himself or herself. However this is not the case for an institutional translator. Specialization is easier for translators working in a governmental institution. There are basic documents in the institutions. And each of them has an institutional memory. This institutional memory can be verbal or written. Even someone who doesn't speak a foreign language in the institution can help the translator or interpreter because he / she knows the functioning of the institution. There is no need for the institutional memory to be written. It can also be asked verbally. Institutional memory facilitates specialization. In the institutional culture, you become more specialized among readers. It's a process. Actually an expert translator is someone who knows what to look for and where to look and also the one who looks at the text and grasps its context and analyzes it".

"What is important at this point is the accumulation of knowledge in candidates of translators. Translation candidates are able to recognize himself / herself as a specialist in translation in 4-year undergraduate courses. These fields can be literature, history, press, technology and so on. Of course, there will be some areas in which the translation candidate feels more competent than other areas. It will be more beneficial if he / she chooses earlier to which field he / she is going to orient in professional life. At this point, it is important that the student knows himself / herself and becomes aware of his / her interests. For example, a translator candidate may be directed to fashion related sites if the candidate has an interest in fashion. Translation instructors can guide students at these points. As for the method of expertise in translation, it will not be useful to memorize a dictionary alone without knowing its context in any field. Translation from source text to target text may be more useful. Because this process is at least three-way. Perhaps the most important thing is to raise awareness of the students regarding the importance of context, knowledge of which concept to use, when and where to use that concept and so on".

Analysis: The participant states that the concept of expertise is widely used in translation studies and that expertise requires professionalization. According to him, since the concept of expertise is used in a broad sense, it is necessary to find a different concept.

The participant associates specialization with translation practice. According to him, the translator is an expert on the condition that he/she can apply his/her expertise in practice. The participant states that there are many fields of expertise such as mining, agriculture and yachting, and that some of the main sources should be read as a condition of being able to specialize in one of these areas and he gives some examples about it. During the four-year undergraduate education, the participant states that the translator enters the process of specialization by recognizing himself/herself in the field of expertise and that the specialization continues after the translation training.

Therefore, the specialization courses given in the translation program can be a preliminary indication of the area of interest of the translator and the main specialization and then the specialization continues either at the introductory

level in translation education or after graduation. Only the practices and translation skills applied in translation education do not show that the expertise in a certain field is achieved.

Participant 5 (Owner of a translation company and medical device translator):

“There are many different fields of specialized translations. Translation departments are often subject to criticism as they are not linked to the specific field. However, translation students in undergraduate education cannot be expected to specialize in all fields. Expertise also differs over time. For example, in the automotive sector, there are different tools like manual, automatic transmission and so on under the automotive umbrella. The medical translation is the same. There are different sub-fields, such as medical device translation. For example, I undertake medical device translation projects under medical translation, but I do not receive translations related to allografts. Because I don't know anything about it and it's a different field. In the same way, although it is related to medicine, I do not translate biocidal products. I'm in the medical device industry. To give an example from this field, the medical device sector is divided into importers (who have dealers), manufacturers and exporters. As to how we have specialized in this field as a company, we have learned the procedure from the Ministry of Health”.

“We have made relevant readings. The Ministry does not share documents but has some open sources. We have reached the documents such as international legislation, European Community Regulation, Medical Device Regulation and made further readings. There are also other consulting companies that do this work. In addition, the last readers of the translation come into play. With the help of Turkish Ministry of Health, pharmaceutical and medical device coordination department of the institution that has a translation system to save institutional translation documents, we have obtained the information of by whom the translation of documents have been used, who obtains these documents, who uses them and so on. and we also interviewed organizations that provided and used these documents. There are reimbursement agencies in Turkey for medical devices”.

“Reimbursement is realized from Social Security Institution. That is why we have learned its legislation. And then we registered the relevant documents in the system and started to issue medical device product labels for each customer or x company. We have received feedback regarding these product labels. We conducted terminology studies to use a common concept in terms. At this point, we examined the approved terminology of relevant institutions. Then we created templates for each company. Necessary updates continue to be made in time. To put it briefly, reading and examining the real sector, examining the stakeholders individually, the last reader, the target audience, acquiring information about where and by whom the translation text will be used, and identifying the audience affected by the translations are the way for me to specialize”.

Analysis: The participant states that the translation training rather than the specialization guides the translator candidate in the process leading to the specialization. According to him, expertise varies over time. There may be different areas within each special subject matter. For example, the participant has specialized himself in medical device translation projects under medical translation.

Based on the statements of the participant, it can be said that he gained his expertise with individual efforts and by cooperating external stakeholders and making further readings in this field. So specialization is an endless process and it is not expected from students to specialize in the fields of translation at once. This is a process and requires a lot of effort. The translation scholar is the person who guides the translator in this respect. The translation scholar

enables the student to choose an area of specialization according to his/her curiosity and interest and acts as an intermediary in gaining knowledge and gaining experience at the introductory level.

Participant 6 (A language expert in simultaneous and written translation, especially in areas such as marketing, branding, entrepreneurship and academic translations):

“I’m both a part-time academician at a university and I have a double major in addition to Translation Studies. I strongly recommend that translation students take into account their areas of expertise both during undergraduate and graduate programs and participate in certificate trainings and conferences if necessary. The Internet is one of the most useful tools as well as the one that causes the most information pollution. Online research should be done, but resources should be paid attention. Academic databases can be used for reliability”.

Analysis: Participant 6 is both a translator and an academician. The participant advises future translators to attend certificate training courses and conferences. When talking about the benefits of the Internet, the participant states that information pollution can lead to disinformation, and that online research should be done in gaining expertise, but it should also be paid attention to its resources. To that end, he suggests academic databases.

It can be argued that the participant encourages students to engage in scientific activities and research and he also recommends academically safe resources during the acquisition of expertise due to his academic identity. It would not be wrong to say that as an academician, as in the above views, this participant suggests that research and reading are important in the process leading to specialization.

Participant 7 (Linguist):

“I graduated from the Department of Linguistics. I recommend reading the books either in the original language or their translations rendered by an expert in linguistics as well as participating in conferences.”

Analysis: Participant 7, as a linguist, advises translator candidates to read the original books and review the translations done by experts, as well as to participate in conferences. This, in fact, is a suggestion that, like other opinions, urges the translator to conduct research and read while gaining expertise.

Participant 8 (Lecturer in Archeology Department):

“I follow the current publications of my field both on the internet and in written texts. I recommend translation students that they follow the relevant publications of the field and have well acquainted with the specific terminology. They can use dictionaries related to the field actively because they will have difficulty in terminology of related fields.”

Analysis: Participant 8 advises candidate translators who wish to specialize in archeology to follow the related publications while having specific terminology and to actively use the related dictionaries during the acquisition of the terminology. This is in line with other views, and the translator gains expertise through reading and doing research. Thus, it can be said that it is impossible for the translation scholar to find time to offer translation students everything in a lecture environment while the candidates of the translators gain their expertise, but information on a specialized field can be transferred at the introductory level. The main responsibility here belongs to the translator candidate who determines his / her area of interest and who will gain his/her expertise by conducting readings and

researches in that area of interest. The translator candidate should also do research and advanced readings on the subject and the field in which he / she wants to gain expertise in addition to participating in the translation courses.

Participant 9 (Social Sciences Specialist):

“I’m trying to follow all the publications related to my field. It provides both the opportunity to be informed and to develop the scientific language. My recommendation to translation students would be that they should limit the area of interest and at least read all academic publications in that field. Thus, he / she knows what the academic terms, idioms and expressions in his / her field of translation are. For example, when rendering a translation about architecture, the use of spoken language or classical literature causes the meaning of the text to change or lose its meaning. Each scientific language has its own form of expression, apart from the terms. A meaningless expression in everyday language may sometimes define a very important sub-meaning in a specific field. For this reason, I think that translation should be limited according to the fields of expertise. In order to be able to master the language of the field they want to specialize, they should have at least in the beginning a little idea and knowledge about that field. They should learn technical terms and phrases. They also should read examples from publications in all branches of the field so that the form of expression and analogies should be well acquainted with and they gain experience to understand that definitions are sometimes used in a simple but symbolic sense. In summary, translation students must first have a basic knowledge and then read a lot”.

Analysis: Participant 9 advises candidate translators to limit their areas of interest in the process leading to specialization and to read all academic publications in the field of specialization. According to him, a word in everyday language can have a different meaning in a specific field. In order to solve this, basic knowledge about the field should be obtained and further readings should be made. This is also similar to the previous views in the process of gaining expertise.

Participant 10 (Lecturer in English Language and Literature):

*“Should translation students want to specialize in literature, they need to do a lot of reading, compare (for example, compare various translations) and gain awareness of reading. As is known in literary texts, language, style and form are very important. For example, reading just the text is not enough to translate Oliver Twist. It is a work written in 1840-1850s. London’s position at that time, the Industrial Revolution in England and its effects on the people, social and human factors, and so on. factors play a major role in translating Oliver Twist. London was famous for chimney sweepers, thieves, prostitutes, pickpockets at that time. There were many thieves on narrow foggy roads and, streets of London. This situation reveals the socio-economic situation of England at that time. When examining the work; the historical, economic, social and human factors of the period in which the work was written should be taken into consideration and these factors should be evaluated in the way of translating the work. At that time child workers were used for chimney cleaning. There were many orphan children. These children, who were important individuals in the UK, were also used in child labor. The century in which the book was written is very important. The chimney sweeper cannot be called a gas heating specialist. Similarly, when translating Edgar Allan Poe; fear, death, and gothic factors are very intense. Why are these themes covered? For example, in Joseph Conrad’s *Hearth of Darkness*, “darkness” actually represents Africa in the eyes of whites. Thus when translating, attention must be paid to language and socio-human and economic factors underlying the language. Background information about the author should be obtained. Acquiring the habit of reading is very important. This habit can be gained through selective works from world literature”.*

Analysis: Participant 10 states that students who want to specialize in literary translation should know the period of the text they translate, the events that take place in that period and the socio-human and economics factors of the century in which the book has been written. This view reveals the importance of research and reading in gaining expertise.

Participant 11 (Lecturer in Translation Studies):

“Specialization and expertise are really important for translation education. In English, there are two different terms “specialization and specialty” used, the first of which is the process while the latter is the situation that occurs at the end of the process. What needs to be emphasized in translation education is the specialization of students according to their interests. A translation scholar can also enable students to be aware of their interests. In the process of specialization, translation scholars do not need to be experts in every field. We, as translation lecturers, guide the student. At the end, the student reaches the point of expertise and determines the area of expertise he / she wants to work in the future. Information-data-knowledge-syntheses-practice-specialization-expertise model is created, knowledge stands in the form of information and data. Then the student begins to obtain information by processing information and data. After the information is obtained and passed through the mental filter, it becomes a synthesis and you can now create your own ideas. It is just like writing a master or phd thesis. This processed information is then applied to the practical environment. The process of specialization begins and at the end specialization is achieved”.

Analysis: Participant 11 states that academics in translation studies do not need to be experts in every field and that they guide the student only in the field of interest. Students gain expertise by starting the process of specialization in the field of interest. In order to gain expertise in the field of interest, it is necessary to do research and reading as in other views in that field.

Participant 12 (Lecturer in Philosophy):

If translation students want to specialize in philosophy, they can take additional courses such as introduction to philosophy and basic concepts. They need to read a lot. It is very important to take additional courses from the philosophy department. Because, without the help of a lecturer, it is very difficult to internalise the concepts and reach the real meaning of the concepts. Following at least a few semesters of basic courses at the undergraduate level will lead to a familiarity with the concepts. For example, graduates of the Philosophy Department should pursue undergraduate courses in their fields of interest to specialize in history of science. Thus, they also get familiar with the concepts of the field. The conceptual recognition of the field will also make the translations functional. Another benefit of taking additional courses is to get to know the discipline and a professor from the field. In philosophy it is quite difficult to close the deficiency by reading alone. For example, in the field of philosophy translations of Kurtuluş Dinçer are more accepted. Because he is also a professor of philosophy. Since he has a good command of the field, his translations are functional as well.”

Analysis: The participant 12 recommends translation students to take courses such as introduction to philosophy and basic concepts to specialize in philosophy. Follow-up of the basic courses can provide a familiarity with the concepts. Thus, translation can be functional. It is difficult to close the deficiency by reading books only. The participant also stated that Kurtuluş Dinçer was a professor of philosophy as the reason why his translations were more preferred in the field of philosophy.

In order to increase the level of knowledge in acquiring expertise, it may be necessary to take courses that constitute expertise in that field. However, the participant gives a striking example of Kurtuluş Dinçer and explains that the translation of philosophical texts is possible and even more accepted by non-translators who have language skills in the translation of philosophical texts. In this case, it may be concluded that the translation of philosophy texts, in areas of specialization where conceptual confusion is intense, is more appropriate to be given by people who are experts in the field and who have language competence but not translators.

Participant 13 (Lecturer in Translation Studies)

“In translation studies, I will try to explain the expertise in translation by starting from the education we obtained in Translation Studies regarding the translations of the texts in the field of law. We took Turkish law and international law courses. In this way, we learned the terms of general law. And general concepts of the legal system in Turkey, courts, criminal cases, court decisions, legal comparison of German law with Turks were general topics covered in the course. Field courses must be taught by the instructor being an expert in that field. At least basic introduction courses can be given from the field specialist. In the current practice at Marmara University, the method of finding an instructor, who is either an interpreter in the translation sector or a freelance translator to teach the translation of specialized texts is used. For example, the media translator, office translator and interpreter who are working in the market come to the department personally and convey their knowledge to the translation students with a concentrated curriculum.”

Analysis: The participant 13 states that she has taken some courses in the field of law in undergraduate studies and thanks to this she has learned the legal terms. According to her, as a translation scholar, field courses should be given by lecturers who are experts of that field. At least basic introduction courses can be taken from the field specialist. For this opinion, a comment similar to the comment from the participant 12 can be made. It can be concluded from the participant's opinion that the experts who are field experts and have also language competence but who are not translation lecturers may offer a more productive course environment for the candidate of translators especially in areas of expertise such as legal texts requiring intensive terminology knowledge.

Participant 14 (Lecturer in Psychology):

“Translator students can read and compare English and Turkish articles written in the field of psychology if they want to specialize in psychology. In addition, introduction to psychology and psychology terms can be taken as additional courses in undergraduate education.

Analysis: The participant recommends that translator students read and compare Turkish/ English articles in order to specialize in psychology and take additional courses such as introduction to psychology and psychology terms in undergraduate education. This is similar to other views, and the translator candidate is expected to read and take courses outside the department but parallel to the specialty in order to advance in that area of expertise.

Participant 15 (Lecturer in Philosophy):

“The area of scientific expertise requires the knowledge of expertise to confront with the language of expertise. For example, in the old texts of Aristotle, the term “passion” is mentioned. When evaluated in terms of philosophy of emotion, this concept can be translated as passion, desire, excitement and feeling. If the difference between these concepts is not known, where can the concept of emotion be derived? The same applies to the philosophy of logic. Logic perception, logic language, basic knowledge of logic can be used. In Translation Studies, there must be an

introduction to philosophy course with high ECTS. And interdisciplinary courses should be taught with students from other fields. Logic can be dealt within 3 months. But this is not true for Heidegger. Translated text is a technical text, a guiding text. It can be a text that will be used in a thesis or in a course. However, if the translation misleads the reader, the translation will not be functional.

“The translator serves to animate the text beyond understanding it and restructures the text in the target language. But sometimes he or she leads to a different restructure, which is very dangerous for specialized texts. For example, the concept of “right” in the philosophy of politics is a central concept in the debate of liberalism. Ralph uses the term “right”. It is translated into Turkish as “hak (right)”. Someone who doesn't know Ralph's concept translates the concept of right as “doğru (true)”. When the “right concept” is translated as “true”, this theory is out of function for the target reader”.

“The perspective of the field is also very important. It is very important in translation to be involved in the debate about the field, to confront it, for example to know the basic concepts and theories of liberalism and communitarianism. One of the biggest mistakes in translation is to think that translation is purely about sentence / syntax. The problem is not actually in the structure. For example, meaning can get lost in terms of emphasis. A meaningful sentence structure constitutes the vitality of the language. Sentence structure makes emphasis. 20th century analytical texts, ancient and medieval texts are different and they have different patterns”.

Analysis: Participant 15 states that the concepts of philosophy need to be conveyed correctly in order for the text to be functional and gives some striking examples of this. For this reason, high introductory courses are recommended for translator candidates. This view is parallel to the views in the field of philosophy and other fields above and gives the impression that the student is required to take an introductory level course in this field.

Conclusion and Evaluation

Based on the expert opinions in the fields of psychology, sociology, archeology, philosophy, translation, linguistics, literature etc. this study can be concluded as follows: Specialization courses in the departments of translation studies established in big cities are given by an instructor who also works in the translation sector as an interpreter or translator. However, the departments of translation studies in the universities established in smaller settlements where this is not possible can eliminate this deficiency through intensive and accelerated courses or by opening certificate programs according to their fields of expertise. Perhaps it would be more beneficial for the departments of translation studies to focus on education in those areas, taking into account the needs of the region and setting. For example, in areas where agriculture and animal husbandry are in high demand, specialization courses on these subjects can be offered. In addition, additional courses can be taken from the common pool of the university or from different areas of interest and general information about the theories, methods and terminology of the related field can be obtained.

Specialization courses in the departments of translation studies can be made available to all university students both in and out of the department by those who are either translation scholars and academicians in different fields or Professional translators or interpreters who can all guide candidates of translators. Thus, students of different fields have the opportunity to study in the same environment. And, information exchange can be more fluid.

In translation, the real sector, stakeholders, the last reader, the target audience, where and by whom the translation text will be used, the audience affected by the translations, in short, the principle of what, in what way and in what context is to be translated is very important. Therefore, it is also important that the translator has such a high awareness of translation. In this way, specialization can be achieved by persevering even in an area which is not known. In addition, as there is institutional memory in public institutions and organizations, specialization can be provided by activating translator communication skills.

The translator should be very careful when translating specialized texts. Because the translator animates the text beyond understanding it and restructures it in the target language. But sometimes the translated text can lead to different restructure. A text that is structured differently can cause the target reader to understand the text in a completely different way and even misunderstand it. As a result, for example, readers of a philosophy text are philosophy students, academics in that field, etc. The translated text will be used to write theses or the students will be trained through those translated texts.

Finally, it is very difficult and even impossible to train students as experts in all fields during translation education. Because there are many areas and sub-areas of these areas. The task of the translation scholar is to enlighten students on the questions of how to specialize in any field, what to do to specialize, and to guide them.

Abstract

It is evident from research on economic and social progress that economic growth does not always lead to social progress but, in some cases, leads to increased socio-political tension, social inequality and poverty. Even having increased production of aggregate product on background, the state of the population is deteriorating and economic growth does not provide for a fair distribution of income. A new approach to the concept of economic development began in the global economy in the late XX century. According to these approaches, economic growth cannot be considered as the main purpose and the indicator of development. In addition to economic growth, there are a number of indicators and their mutual relationship promote human development and well-being. This article examines the correlation between indicators characterizing the welfare of the population and economic growth, comparing the position of Azerbaijan in the accounts of international economic organizations on the relevant indicators. The authors did a comparative analysis with other countries, the impact of human development on people's incomes and the role of education in the wellbeing of the population.

Keywords: Human Development, wellbeing, GDP growth, education, income

Introduction

In the 1950s, the promotion of industry was declared as a development strategy goal adopted in world countries. The development of industry should have led to an increase in total national wealth, and this, in turn, to an increase in national wealth. But the results showed that without government intervention and without carrying out large-scale social programs, national wealth in and of itself is not able to improve the quality of life and reduce the level of poverty. In spite of the fact that in the 1960s a rapid growth rate was observed in many world countries, a notion was formed in those years that economic factors were not an important condition for development. It is no coincidence that in 1962, the UN Secretary-General U.Thant in his speech on the report "The Decade of Development: A Proposal for Action" said: "Development consists not only of economic growth. Development is change along with growth. And change in turn should be like economic and social, and should be both quantitative and qualitative. The main task consists of improving the quality of life. "

New approaches to the goals and possibilities of development in economic theory at the end of the twentieth century:

- The economic growth rate cannot be considered as the main goal and indicator of development;
- There is no direct link between the growth of gross wealth and the prosperous life of people;
- In assessing economic growth, attention should be paid not to the rate of growth, but to quality (its sources and factors);

● Economic growth should not increase the distribution of the population to the strata, and should be aimed at the well-being of future generations, and should also be accompanied by proper guidance (OECD, 1976). The main position of this new approach, which characterizes the linking of economic and social development, was “ensuring the basic needs of the population”. The main postulate of this concept consisted of improving the living conditions of the poor. In those years, unlike traditional views, attention was paid not to economic productivity, but to a reduction in poverty and an improvement in the quality of life. One of the economists who contributed to this concept was the Chilean economist-Manfred Moks-Nef who studied the causes of the crises that occurred in Latin America. In the work of an economist provided to the world society in 1986 under the name “Human scale development: conception, application and further reflections”, such tasks as social well-being and the provision of basic human needs were investigated. In his opinion, development is about people and not about objects. How can we determine whether one development process is better than another? In the traditional paradigm, we have indicators such as the gross national product... Now we need an indicator about the qualitative growth of people. What should that be? Let us answer the question thus: best development process will be that which allows the greatest improvement in people's quality of life. The next question is: What determines people's quality of life? Quality of life depends on the possibilities people have to adequately satisfy their fundamental human needs. (Max-Neef M., 1991).

Improving well-being is the main goal of every state. Measuring well-being in different countries makes it possible to assess its growth rate, and also makes it possible to determine the provision of the population with minimum standards of living and at what level the economy fulfills its responsibilities (Smith A., 1776). Over the years, economists have considered well-being as a concept that measures individual incomes and includes signs of ensuring the physiological needs of a person. Proponents of this approach paid great attention to the formation and composition of income, as well as the distribution and use of cash income between different groups (Osberg L., 2001).

Later in theories, a multidimensional approach to well-being was applied, taking into account the material and socio-economic (conditions for improving the well-being of individuals, access to education, health care, safety, personal and religious freedom) aspect. That is, well-being meant not only income growth, but also the creation of equal opportunities for people, ensuring the socially weak strata of the population with a normal standard of living and a fair distribution of income.

By OECD well-being of the population includes 3 main indicators:

- ✓ *Material living conditions* (or economic well-being), which determine people's consumption possibilities and their command over resources.
- ✓ *Quality of life*, which is defined as the set of non-monetary attributes of individuals that shape their opportunities and life chances, and has intrinsic value under different cultures and contexts.
- ✓ The *sustainability* of the socio-economic and natural systems where people live and work, which is important for well-being to last over time (OECD, 2011).

As can be seen, in the OECD approach, quality of life is not used as synonymous with the level of well-being of the population. Quality of life is perceived as an indicator of well-being. One of the main indicators used to measure well-being is Human Development Index.

Method

In the process of research, the methods of economic-statistical grouping, comparative analysis and the method of least squares were used. The information base consists of the official information of the State Statistics Committee of the Republic of Azerbaijan, the Report of the Human Development Index of the UN Development

Program, the Information of the Statistical Institute of UNESCO and the World Bank. The data cover the years 2001-2017. Models were implemented in the Eviews9 Software Package.

The formation of the first ideas about human development, as well as the methodology of its measurement is associated with the name Mahbub-ul Haq and Amartya Sen (Haq M.ul., 1995). As noted by Amartya Sen, the increase in well-being as a result of development should not be measured by the increase in per capita income, but by the opportunity to live the life that they consider themselves worthy. According to the author, the capabilities of a person depend not only on his individual mind and abilities, but also on the social and economic conditions that society provides him. Therefore, the expansion of human choice depends on the conditions, economic, social and political opportunities existing in the country (Sen A., 1987).

The Human Development Index (HDI) developed within the framework of the United Nations Development Program since 1990 and which includes four integral indicators is an indicator that makes it possible to measure the level of well-being along with the level of human development (UNDP, 1990). HDI is considered to be an effective tool for informing the state about existing economic, social and political problems that prevent people from maximizing their opportunities. Because HDI is an indicator that makes it possible to evaluate the results obtained by economic development, health care and education.

Methodology: The novelty of the Human Development Index was that it was a statistical indicator able to characterize both social and economic development. The HDI is the geometric mean of normalized indices for each of the three dimensions:

$$HDI = \sqrt[3]{I_{health} * I_{education} * I_{income}}$$

Life Expectancy Index - I_{health} - is the most common indicator characterizing public health and the level of medicine. This index is determined on the basis of the number of years that everyone who is born can live.

Education Index - $I_{education}$ - characterizes the development of education and the ability of the population to get an education. This index is measured on the basis of the expected number of school years for each child and the number of years spent on schooling after 25 years.

Gross National Income Index - I_{income} - is calculated by parity of consumer ability and the logarithm of gross national income per capita.

Also, note that the current methodology was introduced in 2010 after changes as a result of long conceptual discussions. The proposed methodological difference was to update the method of adding all three indices in the human development index. The HDI computed in 1990–2009 was based on the mathematical average of subindices $HDI = (I_{health} + I_{education} + I_{income}) / 3$. In this method of calculation, sub-indices compensated each other. As, the underestimated level of one indicator was compensated by the overestimated other indicators. As a result, the mathematical indicators characterizing education and health care were weakly expressed in the human development index. But the main feature of the method presented in 2010 was that HDI more clearly reflected the change in each parameter. Another difference was that new indicators were used in the calculation of the *Education Index* and the *Gross National Income Index*. Thus, in 1990–2009, the *Education Index* was calculated on the basis of two other indicators, the literacy rate of the population and the enrollment ratio, and the *Gross National Income Index* was calculated on the basis of per capita GDP. Literate population expressed the number of people 15 years and older who can read, write and perceive. This indicator could not sufficiently clearly reflect the quality of education and functional illiteracy.

HDI varies between 0-1, approaching the unit indicates a high level. 1 - 0.800 - shows the ranking of countries with the highest, 0.799-0.700 - with high, 0.699 - 0.550 - with medium, and below 0.550 - with weak human development. This coefficient in Azerbaijan was, equal to 0.640 in 2000, increased to the level of 0.757 in 2017.

As a result, Azerbaijan left the group with an average level of human development and joined the group with a high level of human development. At present, Azerbaijan is in 80th place among 189 countries. In the top three included - Norway (0.953), Switzerland (0.944) and Australia (0.939) (UNDP, 2018).

According to the World Bank, the world's GDP in 2017 was 80.886 trillion dollars (with current prices). Azerbaijan produces GDP in the amount of 40865.6 million dollars, which is 0.05% of world GDP (World Bank, 2019.). To study the proportionality between the well-being of the population and economic development, we calculated the correlation between GDP per capita and human development in 130 countries (Diagram 1.).

Diagram 1. Gross national income per capita (2011 PPP\$) and Human Development Index (2017)

Source: <http://hdr.undp.org/en/data>

As can be seen from the chart, the trend curve has an increasing trajectory. Depending on the interpretation, it can be said that in countries with high GDP per capita, that is, in rich countries, the well-being of the population is also high.

Studies by international organizations and individual economists prove that investment in human development and education provides for the improvement of material well-being in the long term. At the microeconomic level, the economic benefits of education and its impact on income have been studied in researches of Schultz (1961), Becker (1964), Mincer (1974). The evaluation results carried out using dependencies Mincer show that the private average global return to a year of schooling is 9% a year. Also note that the estimates were based on 1120 observations conducted in 139 countries during 1950–2014 (Psacharopoulos G., Patrinos H.A. 2018). According to the estimates of the working group on education of the World Bank, an increase in the average duration of education in Azerbaijan was observed with an increase in annual income by 7.2 percent (Montenegro C., Patrinos H.A. 2014).

According to our estimates in Azerbaijan, with a decrease in the level of education, that is, the intellectual level of the head of the family, their income also decreases. The incomes per capita of households with the head of families having higher education are greater than those ones who have no schooling by 17.7%. (Muradov A., Hasanli Y., Musayeva F, 2019).

In assessing the impact of education, more attention was paid to economic growth and income. But new researches are studying the effect of education on human health. A high level of education (especially for women) significantly affects life expectancy and mortality. In 1970-2010 years decline in the mortality rate among people aged 15-60 years in the 1/3, as well as reducing child (under 5 years) mortality rates of 14% is

associated with the education of women. This is explained by the fact that educated women have easier access to health care, on the other hand, they have a greater impact on their lives and the lives of their children, and on managing the economy. According to the results of research in the studied years one dollar invested in an additional year of schooling, particularly for girls, generates earnings and health benefits of \$10 in low-income countries and nearly \$4 in lower-middle-income countries (Schäferhoff M., Dean J., 2016).

Studies show that there is a positive relationship between parental education and that of their children. According to the results of research children who have both parents with low education (secondary, primary), at best have a chance to get a university education in 15%. In families of which at least one of the parents received a university education, this chance for children reaches 60% (OECD, 2018).

Findings

To study the proportionality between material well-being and the level of education of the population, we calculated correlations between the average annual, average monthly salary and the education index in 60 countries of the world (Diagram 2.). There is a scattering of developed western countries close to the trend curve. This indicates that in these countries there is a dependence between the level of education and incomes of the population. As can be seen from the diagram, at the bottom of the trend curve there is a group of countries that is scattered with large deviations. These are the poor states of Africa and the East as Surya, Bangladesh and Afghanistan. This is due to the political and economic situation, the shortage and inefficient use of human capital. Sometimes it is impossible to achieve income growth by increasing the level of education and improving the coverage ratio of education. The overall political situation, the level of fees and investments, income distribution are considered important determinants in countries. If there is no demand for labor in the labor market, in other words, people have a low employment opportunity, then the increase in the number of educated people in this country increases the number of literate unemployed. On the other hand, if in the labor market wages are not proportional to the complexity and quality of labor, then education loses its social significance.

Diagram 2. Education index, average income annually and monthly salary (2017)

Source: <https://www.worlddata.info/average-income.php>, <http://hdr.undp.org/en/content/education-index>

Note that in Azerbaijan, in fact, regardless of the geographical location and incomes of the population, children complete a nine-year education (*general secondary schools*). Therefore, the overall literacy rate in the country is 99.8 percent. Despite the fact that children have positive trends in participation in education, opportunities for higher education are limited. Coverage rate of primary and general secondary education is 100%, and higher

education is 33%. The result of this is that in 2017 the number of people with higher education among the population of 15 years and above is only 13.3%.

To assess the material well-being of the population, we will use sample surveys of household budgets prepared by the statistical observation method by the State Statistics Committee of the Republic of Azerbaijan. The amount of monthly income per person in a family increased 4.9 times compared with 2001 and reached 157.9 US dollars (Table 1). And the amount of monthly expenses per person in a family grew 4.6 times and reached 163.7 US dollars. As can be seen from the table, with the growth of incomes of the population, the volume of expenditures on education also increased. This indicator in 2001 was equal to 0.44 dollars, and in 2017, to 3 dollars. During the 16 years reviewed, expenditure on education increased 6.9 times.

Table 1. Income and expenditures of households (current prices, US\$ 2017)

Years	Income of households (per capita, per month)	Consumption expenditures of households (per capita, per month)	Difference	Education expenditures of households (per capita, per month)
2001	32.3	35.3	-3	0.44
2010	180.3	184.3	- 4	2.8
2017	157.9	163.7	- 5.8	3

Source: https://www.azstat.org/portal/tblInfo/TblInfoList.do#994_025

The following results were obtained from the econometric estimation of dependence between family income and education expenditure.

$$\text{DLOG}(\text{EXPENDIT}) = 0.041686 + 0.806659 * \text{DLOG}(\text{INCOME}) \quad (1)$$

(s.e.) (0.044567) (0.202289)

R-squared = 0.531794 Adjusted R-squared=0.498351 Durbin-Watson stat = 1.976627

here,

DLOG (EXPENDIT) - expenses for family education during the month,

DLOG (INCOME) - income for families during the month,

S.E. - standard error parameters,

R-squared - determining coefficient,

Adjusted R-squared - shows the specified determinant coefficient,

Durbin-Watson stat - is a test for autocorrelation in a data set.

In Eviews the main statistical characteristics and other relevant tests shown in the table taken from the regression equation and other relevant tests show that the model is adequate. The statistical studies and correlations indicate that families are interested in investing in education. Thus, the growth of monthly income per person in families by 1%, contributed to the growth of expenditures on education by 0.81%.

At the next stage, we will assess the impact of education expenditures on household income at the macroeconomic level. Note that education expenses by country can be classified in 3 groups:

- ✓ Expenditures from the state budget
- ✓ Family Education Expenditures
- ✓ Funds for staff development allocated by institutions.

Due to the fact that there is no data on the last item SSCAR, we will introduce two items of expenditure into our research. The calculations show that in the country, expenditures on education increased by 5.6 times compared with 2001 and reached 1,368.9 million dollars in 2017. Approximately 1/4 of the cost of education falls to the

share of families. Family spending on education in 2017 amounted to 356.3 million dollars, and in 2001 43.7 million dollars.

Source: https://www.azstat.org/portal/tblInfo/TblInfoList.do#994_025 and
https://www.azstat.org/portal/tblInfo/TblInfoList.do#994_020

And the budget expenditures on education in 2017 amounted to 1012.6 million dollars. As can be seen from the diagram, the amount of funds allocated from the budget has been growing since 2001. Due to the devaluation in 2015, there is a relative decline in spending in dollar terms. Although spending on education has increased since 2001, this is lower compared with the growth in general government spending. Compared to 2001, general government expenditures increased 11.8 times, and expenditures on education 5.1 times. As a result, the share of expenditure on education in total expenditures decreased from 23.1% to 9.9%. In 2017, the amount of funds allocated from the state budget for education was 2.5% of GDP. Note that according to the World Bank, this figure in the world is 4.8%, in countries with high incomes of 5.2%, in countries with low incomes 3.5%, in heavily indebted poor countries 4%.

The result of the regression equation that measures the impact of education expenditure on population income is as follows:

$$\text{LOG}(\text{INCOME_ANNUAL}) = 3.48262474601 + 0.955882235974 * \text{LOG}(\text{EXP_EDU}) \quad (2)$$

(s.e.) (1.183194) (0.202289)

R-squared = 0.893654 Adjusted R-squared=0.886564 Durbin-Watson stat = 1.784233

here,

LOG(EXP_EDU) - the total education expenditure in the country

LOG(INCOME_ANNUAL) - population's income

In Eviews the main statistical characteristics and other relevant tests shown in the table taken from the regression equation and other relevant tests show that the model is adequate. As it is seen from the equation, the 1% increase in the education expenditures was reflected in the increase in the income of the population by 0.96%.

Results, Conclusions and Recommendations

Education, in the long run, provides improvement of well-being of the population and the development of human capital. As a result of large-scale social programs conducted by the state in Azerbaijan, the opportunities for education and indicators for children and students have relatively improved. Revenues from the export of petroleum resources have led to improved well-being and increased incomes of the population. Revenue growth has significantly affected the growth of spending on education. Due to the results of researches families are interested in investing in education. The growth of monthly income per person in families by 1%, contributed to the growth of expenditures on education by 0.81%.

At the macro level, the growth of expenditures on education ensured a growth in the income of the population by 0.96%. Statistical estimates show that education expenditures from the state budget prevail in total education expenditures. Although government spending on education has increased during the study period, its share in total government spending has declined.

Abstract

The article examines the possible effects of education on quality of life and outlines the current theoretical and methodological approaches to assess quality of life. In addition, the labor force level in the labor market in Azerbaijan is analyzed by HDI and quality of life analysis when compared to developed and developing countries. As a result of the research, the impact of education on labor supply, poverty reduction and quality of life was determined according to the needs of the labor market in Azerbaijan. As in the case of different countries studied in Azerbaijan, a good relationship between education level and social and economic development levels was confirmed.

Keywords: Quality of life, Education, Human capital, Labor, Human development

Introduction

Quality of life is a complex and multidimensional concept. The bio-social-moral quality of human life depends on the satisfaction level and quality of material, social and moral needs, as well as on the physiological, social and moral development conditions. From a socio-economic point of view, quality of life typically relates to the assessment of a particular part of life's characteristics and reflects the extent to which it can meet its material, and cultural needs. Quality of life is defined as the socio-economic category that determines the level of physical, moral and social needs of people on the one hand, and the socio-economic category that determines the quantity and quality of important goods and services used to meet these needs. Within the framework of this approach, it is seen that the level of compensation is understood for the material and moral needs of people. The

level of compensation is defined as the level of consumer standards for human existence and functioning. As you can see, quality of life is measured not only by income but also by complex indicators. As mentioned, the quality of life reflects the level of satisfaction of people's material and spiritual needs for a certain period of time. In this respect, S. A. Vasnev's book "Statistics: The Teaching Book" provides a more detailed study of the concept of quality of life. It is based on the level of satisfaction of the material (food products, clothing, housing, household goods) and moral (labor, employment, health, education, recreation) needs of people under the standard of living of the population. In this context, the "level of life" is characterized by the provision of the necessary material wealth and services to the minimum level of consumer demand and the degree of effective consumption of the population. Given these aspects, economic theory is considered an important and highly complex socioeconomic life category. The world's success in modern times is characterized by the level of life of the citizens in that country. The ruling political regime and economic policy are inextricably linked to the welfare of the country's population. The survival of the political struggle and the period of power in the country depends largely on the promises and the fulfillment of promises made directly by the citizens. On the other hand, in the modern era, more and more indicators of economic development have begun to be implemented. In general, in the modern age, welfare level, life level, quality of life and related concepts are applied to express the effectiveness of economic and social development in the country and are considered to be essentially similar.

Literature summary

The concept of 'welfare' is regarded as one of the oldest concepts of the economy and is depicted in the works of the ancient philosophers and philosophers in accordance with the conditions in which they live. It should be noted that since the well-being of the population is considered to be a very complex economic-social reality, it has become a problem not only in economics but also in sociological, religious and philosophical studies. Although the concept of 'welfare' or 'prosperity' is explained differently in different approaches, in dictionaries it is generally defined as the level of material and moral support of society [4]. The Great Encyclopedic Dictionary defines the level of welfare as the conditions and products necessary to meet the specific needs of the population [10]. In the Economic Dictionary, welfare is an indicator that determines the living standards of people. The Economic Dictionary also notes that a system of indicators characterizing the welfare/ prosperity has been defined. Some researchers have stated that welfare is a social and political concept and they see it as a suitable environment for the success of human development. Brokhuez and Yefron see social welfare as a social goal, and these goals can only be achieved politically in terms of state and state interest in the process. In the "welfare" economic category, thinkers and economist scholars are particularly careful at different times. Since the welfare of the country reflects the success of the political regime, this understanding has some "political shadows" [2]. For this reason, the prosperity of the citizen in various historical stages, periods and political structures has always been the focus of attention and has been the subject of research in economic theory. Mayer considered the level of life, the material and spiritual product (value) necessary for life, the level of consumption and the level of satisfaction of the needs of people in these products. It seems Mayer looked at this view in a narrower context and approached it in general [7]. Life is a category that changes according to time and place. In this respect, it is suggested that the level of life should be considered as "material consumption value and moral values compared to social norms based on the historical consumption context" (Social Policy). In this approach, it can be concluded that the level of living in a given period depends to a large extent on specific time and norms of society. The analysis shows that in the nineteenth century, Karl Marx proposed to meet certain needs: not only the standard of living, but also the conditions in which people lived and supported. Marx stated that it is necessary to know its level of development in order to determine the need for consumption (consumption). He stated that consumers are characterized by the need for consumption, such as the final stage of recycling, and that consumption is as important as demand and emphasizes the importance of mutual relations between them.

The United Nations Statistical Commission considers it appropriate to coordinate the living standards of the population, taking into account the living conditions, consumption levels, employment and freedom of expression of the population [3].

The analysis of approaches allows us to say that both goodness and level of life are defined in two dimensions. Both concepts are considered narrowly (individual) and broadly (community). In a narrow sense, if the standard of living is determined according to the basic level of human welfare, it is based on certain historical conditions and conditions accepted by society. It should be noted that the provision of an appropriate level of life provides an opportunity for every citizen to be a useful person and to promote development. The standard of living is the economic category and social standard that determines the degree of satisfaction of a person's moral, physical and social needs. In other words, the standard of living of the population is an important indicator of the well-being of the population corresponding to the economic growth of the country. In broader terms, this parameter also reflects the level of food and non-food products and services available to the population. Therefore, we can say that the level of life as a complex social and economic category is the level of consumption that makes a person a useful member of society, as well as the development and maintenance of this consumption.

Method

Approaches to the concept of "quality of life" began to grow further in the second half of the last century. In recent years, different international organizations and expert groups have developed different quality of life indicators system. One of them is an indicator system created by Nobel laureate Joseph Stiglitz(2018), Amartia Sen (2018) and Professor Jean-Paul Fouzzi (2018). In Stiglis-Sen-Fitussi's report, the structural components of the concept of "quality of life" are [14]:

- material living conditions (income, consumption, wealth);
- production and other activities
- health care;
- having different levels of education and skills;
- social interaction;
- economic and physical security;
- management and fundamental rights;
- natural and living conditions;
- overall life experience.

The most widely used method for assessing the quality of life is the Human Development Index approved by the United Nations Development Program RIO Declaration in 1991. It should be noted that the human development index is calculated as the numerical average of the 3 subgroup indices. These include the life expectancy index, the education index and GDP (according to purchasing power parity) [6] .

Table 1. Country profile of human development indicators (Azerbaijan)[11]

Human Development Index	HDI : 0.757
Human Development Index	80
Health	Life expectancy at birth (years): 72,1
Education	Expected years of schooling (years): 12,7 Mean years of schooling (years):10,7
Income/Composition of Resources	Gross national income (GNI) per capita (2011 PPP \$): 15600
Inequality	Inequality-adjusted HDI (IHDI): 0.681
Poverty	Multidimensional Poverty Index (MPI): 0,019
Demography	Median age (years) 30.3
Gender	Gender Development Index (GDI): 0.949

Dayanıqlılıq	Adjusted net savings (% of GNI): 1.7
Human Security	Refugees by country of origin (thousands): 10.3

Source: UNDP, “Country profile of human development indicators”, 2018

In addition, the UNDP Sustainable Development Goals have high quality education for early child development and access to education, equal access to education for all young people and the elderly, knowledge of mathematics, elimination of gender inequality in education, employment, appropriate workforce and appropriate technical and professional skills for entrepreneurial activity. A significant increase is in the number of young and old people promoting healthy lifestyles, human rights, gender equality, peace and culture and non-violent actions. With regard to these issues, the level of assurance of qualified teachers in countries should be greatly increased through international cooperation, and the level of access to knowledge and skills necessary for world citizenship, cultural education and sustainable development should be increased. Apparently, this approach was considered one of the key indicators of the level of educational development. In addition, the UNDP Sustainable Development Goals have high quality education for early child development and access to education, equal access to education for all young people and the elderly, knowledge of mathematics, elimination of gender inequality in education, employment, appropriate workforce and appropriate technical and professional skills for entrepreneurial activity. A significant increase in the number of young and old people promoting healthy lifestyles, human rights, gender equality, peace and culture and non-violent actions. This ultimately leads to the establishment of institutions of higher education and training, including vocational education, ICT, technical engineering and scientific programs, open to children's disability and gender issues, with a safe, inclusive and effective learning environment for all. A significant increase is in the number of scholarships on a global level.

With regard to these issues, the level of assurance of qualified teachers in countries should be greatly increased through international cooperation, and the level of access to knowledge and skills necessary for world citizenship, cultural education and sustainable development should be increased. Apparently, this approach was considered one of the key indicators of the level of educational development. One of the most important ways to improve the quality of work and at the same time increase the productivity of the workforce is to increase the employment quality of the working population and increase the level of education of the employees. In the last few decades, almost all countries have taken action to improve the quality of education. They emphasize that it is impossible to talk about improving the quality of life without raising the quality of education. Education is one of the most effective tools in developing efforts to achieve the desired level of life. At the same time, education is the most important social service that increases the welfare and benefits of the society and increases the equality of opportunity and the ability of individuals to shape the welfare and happiness, social justice [4]. The impact of education and training on economic development as the driving force of the economy has attracted the attention of economists and researches have been conducted in this direction. It should be noted that education in the knowledge-based economy is the foundation of economic development because education is the key to technological innovation and high efficiency. Furthermore, as a means of transferring knowledge for generations, education is the foundation of human civilization and has a significant impact on the quality of life of individuals. The lack of knowledge, skills and competences limits the ability to access the labor market and the level of economic prosperity, increases the risk of social isolation and poverty, and may prevent full participation of civil liberties and political issues. Research and experience from countries around the world show that education has an exceptional role in addressing these problems, increasing and influencing people's knowledge of the world. All of these factors have always been at the center of researchers' attention during the historical development of countries. Although prominent thinkers such as Adam Smith (1776), Thomas Robert Malthus (1798), David Ricardo (1817), John Stuart Mill (1821) and Karl Marx (1847) have focused on the importance of education for economic activity and economic development, their theories are not detailed and

systematic. Economists invested heavily in Western Europe and Japan, especially after World War II; where investments in physical capital could be used efficiently and effectively to invest in this field.

T. W. Schultz(1963), J. W.Bekker (1992), with the understanding that education and human development affect economic development much larger than all other factors. Human capital theory emerged under the influence of economists such as Robert Solow (1990) and Robert E. Lucas (2014). The fundamental changes that advance human development are the importance of technical and scientific knowledge, from simple techniques to modern techniques, as well as increasing the physical and intellectual aspects of production and management, marketing and human production processes. There is an increasing need for advanced human factor. The effects of human capital on economic growth were investigated in the 1960s by Schultz and Denison in the United States. It has been determined that education has a direct impact on national income growth by increasing the capacity and production capacity of the labor force. Denison found that one-fifth of the increase in GDP per capita in the

United States in the period 1948-1973 was related to the increase in the level of education of the labor force[9]. In 1956, J. W. Kendrick tried to explain what factors of production occurred during the 1889-1957 production growth in the US economy (3.5%). As a result of this study, while the share of classical production factors such as capital, labor and land is 1.9%, the share of other factors is found to be 1.6%. This means that improving the quality of mankind can lead to economic growth. Robert Solow, a US economist who won the Nobel Prize in Economics in 1987, and especially economic growth studies, acknowledged that technical change was not neutral between 1915 and 1955, that is, the change in the rate of change between investment and labor. The Labor Economy in the US economy has shown that approximately 10% of the growth in production per hour is due to the increase in physical capital and the effect of the resulting increase, with 90% out of the usual production factors [10]. The development of education as one of the main tools of national development is the responsibility of each country to its citizens. As a result, the provision of schools, colleges and universities in most countries depends largely on the public sector. Over the past decades, efforts have been made to develop educational institutions in these countries and to position them in the international ranking. These efforts aim to support the development of educational tourism in the country, while avoiding ‘brain drain’, and to ensure that the educational potential is used more effectively. All these factors should be kept in mind when considering the quality of educational institutions and all educational institutions should be designed to ensure to serve potential students in these directions.

Findings

Comparative analysis of education level in Azerbaijan

Research shows that in recent years there has been an increase in the average education time of people in the 25-64 age group in developing countries. This is more obvious in the following table.

Table 2.Population with at least some secondary education (% ages 25 and older) [5].

	2000	2005	2010	2015	2016	2017
<u>Azerbaijan</u>	92,8	92,7	95,6	95,6	95,6	95,6
<u>Belarus</u>	–	–	89,3	89,3	91,9	91,9
<u>Finlandya</u>	44,4	100	100	100	100	100
<u>Georgia</u>	91	92,4	–	96,7	95,5	95,5
<u>Germany</u>	73,4	96,9	96,4	96,5	96,5	96,5
<u>Indonesia</u>	21	43,3	43,4	47,3	48,8	48,8

<u>Kazakhstan</u>	89	99,3	99,6	100	99,3	98,8
<u>Kyrgyzstan</u>	79,8	86,2	95,6	98,7	98,6	98,4
<u>Norway</u>	77,7	96,6	93,9	95,3	95,3	95,7
<u>Russian Federation</u>	90,1	92	90,9	95,6	95,6	95,6
<u>Turkey</u>	27,1	30,6	44,2	54	52,2	52,2
<u>Ukraine</u>	88,2	91,7	93,5	95,1	95,5	95,1
<u>Uzbekistan</u>	–	–	–	99,9	99,9	99,9
<u>Yemen</u>	6,6	11,7	17,6	24,4	26,1	27,1

As can be seen from the table, in developed countries or developing countries, there is an increase in the share of those receiving education in the population aged 25 years and over. Thus, in highly developed countries such as Germany and Norway, 73.4 and 77.4 percent of the total population in this age group had general education, which increased to 96.5 percent and 95.7 percent in 2017. There is an increase in this weight in Azerbaijan and other post-Soviet countries. However, this shows that the trend towards education among the population has increased dramatically in recent years. The economies of the countries are moving from employment to employment. As you can see, education is extremely important in improving the quality of life of the population. First of all, it shows itself at the employment level of the population. As seen from the experience of European countries, the increase in the level of education has a positive effect on both the employment and the employment of the population in employment.

Table 3. Distribution of employed and number of unemployed population by education levelthsd. Person [10]

	Total	higher education	secondary specialized education	vocational education	secondary education	main education	primary education
Employed population	4822,1	796,9	516,4	260,5	2892,6	306,6	49,1
Unemployed persons	251,7	35,2	31,6	18,5	131,4	33,3	1,7

Considering the distribution of employment among the population in Azerbaijan, it is understood that in both cases the employment of the weighted holders stems from the graduates of educational institutions. Thus, total employment was 93 percent of the population. A higher education level is often associated with better professional perspectives and higher income and therefore has a positive impact on quality of life. Higher education graduates improve their working skills: In the EU-28, the unemployment rate is higher than the lower education level and at a lower level for higher education. Based on information on the level of unemployment by level of education, in the EU-28, with a low level of education in 2017, people between 15 and 74 years of age are more likely to be unemployed (such as 14.8 percent).); The unemployment rate of people with higher and lower education is high in Lithuania, Slovakia, Hungary and Bulgaria and relatively low in Cyprus, Greece and Portugal. Significant efforts are underway to reduce unemployment in Azerbaijan. One such measure is measures aimed at changing the qualifications of the cadres and the requirements of the labor market. This is more obvious than the following table:

Table 4. Professional training of staff person

Indicators	2005	2010	2014	2015	2016	2017
Passed professional training –total	5254	4792	6914	7453	4815	4502
of which:						
Retrained	2143	1503	2687	4029	681	1180
Raised qualification	5196	3389	4136	3888	11147	7102
Graduated from total number of workers who passed professional training and raised qualification	10450	8181	11050	11341	15962	11604
in direct enterprise	4540	2153	4091	4164	7324	2117
in foreign country	123	118	49	33	28	119
in educational institutions	18	186	1695	4002	1344	3838
advanced training institutes	86	218	607	441
training courses	5129	2924	6659	5089
Women	1501	712	665	440	751	488

As can be seen from the table, approximately 120,000 people were employed in vocational training or retraining courses in 2005-2017 according to labor market requirements. This is one of the most important factors that determine the importance of education in improving living standards and quality of life.

Table 5.Raising qualification of officials and specialists person

Indicators	2005	2010	2013	2014	2015	2016	2017
Raised qualification	10022	22326	17234	15450	13045	14429	11499
including:							
officials	972	1968	4459	3437	2749	2724	1837
specialists	9050	20358	12775	12013	10296	11705	9662

These refinement issues are also addressed to authorities and experts. Between 2005 and 2017, 104,000 people were trained in these programs. When interpreting education levels for the whole population, it should be noted that formal education systems include older generations that may have emerged in older generations, for example in a shorter education period, for example when they are quite different.

Evaluation of the impact of education on quality of life.

Assessing the impact of education on improving the quality of life is also of great importance for learning this problem.

Table 6.Evaluation of the impact of education on quality of life [12]

Countries/Territories	1999	2012	2015	Change 2012-2015
United Kingdom	...	0,996	0,994	-0,2

Japan	...	0,994	0,994	0,0
Norway	...	0,993	0,992	-0,2
Kazakhstan	0,976	0,990	0,993	0,2
France	...	0,990	0,990	0,0
Denmark	...	0,989	0,989	0,0
Croatia	0,972	0,989	0,985	-0,4
Germany	...	0,985	0,981	-0,4
Kyrgyzstan	0,962	0,984	0,985	0,1
Russian Federation	...	0,981	0,979	-0,2
Latvia	0,980	0,980	0,974	-0,5
Belarus	...	0,979	0,979	0,0
Uzbekistan	...	0,968
Azerbaijan	...	0,965	0,954	-1,1
Turkey	...	0,939	0,950	1,2
Islamic Republic of Iran	0,878	0,935	0,947	1,2

Although Azerbaijan has made significant progress in the field of education, much remains to be done. According to the United Nations Educational, Scientific and Cultural Institute (UNESCO) Institute for Statistical Education (EFA Development Index), Azerbaijan ranks 40th among 127 countries. Kazakhstan ranked 4th in the post-Soviet area, Estonia 20, Georgia 30, Kyrgyzstan 42 and Uzbekistan 44th. indices in education are found in developed countries. Although the level of education index in the Republic of Azerbaijan is higher than the world average, potential opportunities for further development of this area continue.

Development and development dynamics in all areas of Azerbaijan's rapid development The report of the United Nations Development Program shows that education spending in 132 countries is 4.9%. Cuba, Vanuatu, Lesotho, Yemen, Brunei, Mongolia - 9%, Denmark, Guyana, Malaysia - 8%, America, England, France, Switzerland, Mexico, Iran, Italy, Oman, Germany, Spain, Hong Kong, Russia, Japan, Turkey and more than 4% in Romania, Armenia, Azerbaijan, Kyrgyzstan and Kazakhstan about 3% at the end of the list, Pakistan, United Arab Emirates, Indonesia, in countries such as Ecuador was recorded as 1%.

As you can see in the table, the education index in the world countries is changing dynamically. The highest indices in education are found in developed countries. Although the level of education index in the Republic of Azerbaijan is higher than the world average, potential opportunities for further development of this area continue.

Table 7. Education index [12]

Countries	2005	2010	2013	2015	2016	2017
Azerbaijan	0,652	0,681	0,698	0,709	0,709	0,709
Belarus	0,716	0,829	0,835	0,836	0,838	0,838
Georgia	0,753	0,777	0,804	0,831	0,845	0,845

Germany	0,902	0,928	0,933	0,940	0,940	0,940
Ghana	0,454	0,526	0,548	0,556	0,558	0,558
Indonesia	0,552	0,586	0,614	0,616	0,622	0,622
Iran (Islamic Republic of)	0,552	0,662	0,738	0,741	0,741	0,741
Kazakhstan	0,789	0,781	0,802	0,806	0,809	0,814
Kyrgyzstan	0,687	0,697	0,721	0,728	0,735	0,735
Moldova (Republic of)	0,676	0,696	0,716	0,709	0,710	0,710
Norway	0,901	0,912	0,914	0,908	0,915	0,915
Russian Federation	0,762	0,772	0,806	0,828	0,832	0,832
Tajikistan	0,649	0,671	0,667	0,662	0,660	0,659
Turkey	0,530	0,608	0,667	0,683	0,689	0,689
Turkmenistan		0,624	0,626	0,627	0,629	0,626
Ukraine	0,776	0,788	0,791	0,794	0,794	0,794
Uzbekistan	0,645	0,674	0,699	0,704	0,708	0,718
Worldwide average	0,583	0,617	0,637	0,646	0,650	0,651

The report of the United Nations Development Program shows that the ratio of education spending to national income from among 132 countries is 4.9%. Cuba, Vanuatu, Lesotho, Yemen, Brunei, Mongolia - 9%, Denmark, Guyana, Malaysia - 8%, America, England, France, Switzerland, Mexico, Iran, Italy, Oman, Germany, Spain, Hong Kong, Russia, Japan, Turkey and more than 4% in Romania, Armenia, Azerbaijan, Kyrgyzstan and Kazakhstan about 3% at the end of the list, Pakistan, United Arab Emirates, Indonesia, in countries such as Ecuador was recorded as 1%.

It should be noted that the measures taken are reflected in the education index as a whole. These factors are reflected in the education index, which is part of the human development index finally adopted by the United Nations Development Program, and reflects actual and potential education per capita in more than 180 countries around the world.

In this case, the share of GDP in GDP should be increased and the share of the other two sub-indices should be reduced. That is, the theoretically determined 0.33 effect for each sub-index may increase or decrease over time as a result of changes in the factors that make up the sub-indices. Regardless of the HDI's dependence on LE, EU and GDP, and regression analysis, statistical methods are used to verify the accuracy of the initial decision. The results will be as follows:

Chart 1.The specific weight of education indices in the human development index

In this case, the share of GDP in HDI development should be increased and the share of the other two sub-indices should be reduced. That is, the theoretically determined 0.33 effect for each sub-index may increase or decrease over time as a result of changes in the factors that make up the sub-indices. Regardless of the HDI's dependence on LE, EU and GDP, and regression analysis, statistical methods are used to verify the accuracy of the initial decision. The results will be as follows:

$$HDI = 0.294037 * LI + 0.358 * EI + 0.351 * GDP + 0.14$$

Table 8. Outcome of regression analysis of HDI dependence on LE, EE and GDP

Dependent Variable: HDI				
Included observations: 23				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
EI	0.358237	0.009302	38.51236	0.0000
LI	0.294037	0.008671	33.90859	0.0000
EI	0.350046	0.001371	255.3268	0.0000
R-squared	0.999957	Mean dependent var		0.693043
Adjusted R-squared	0.999953	S.D. dependent var		0.054207
S.E. of regression	0.000372	Akaike info criterion		-12.83573
Sum squared resid	2.76E-06	Schwarz criterion		-12.68762
Log likelihood	150.6109	Hannan-Quinn criter.		-12.79848
Durbin-Watson stat	1.708708			

The results can be considered significant. Thus, the high value of the adjusted regression coefficient indicates the correct selection of dependency. F is higher than the critical F value, which reflects the statistical reliability of the regression factor. Insufficient standard errors allow the t-statistics to be greater than the critical t prices that substantiates the stability of the coefficients and stability.

Results

As the results show, the main shareholder in the development of the human development index is the index of 0.335, indicating that a 10 percent increase in the education index will lead to a 3.36 percent increase in the human development index. In second place, the gross domestic product index is 0.350. The impact of the life expectancy index on the human development index was determined as a 10 percent increase and an increase of 2.29 percent. These findings confirm the accuracy of what we said before, and education has a special importance in terms of human development, the formation and development of life.

Abstract

The article outlines the essence of the state's regional policy and determines its main directions. Specifically, the criteria for determining the backward regions, which are of crucial importance in the formation of the regional policy of the state, have been substantiated. The article also substantiates the directions of financing the social and economic development of the regions. These justifications cover energy, transport and social development issues. The article outlines the factors that necessitate the state support to the development of the rural areas. The density of the population was noted as the main factor supporting the development of rural areas. Thus, in rural areas, due to low population density, both production and sales of products require large expenditures in comparison with urban areas.

Keywords: Regional policy, spatial inequalities, financing rural development, state programs

Introduction

Provision of regional development at the present stage of Azerbaijan's economic development is one of the most important priorities. Development of all regions of the country leads to overall development and increase of living standards of the population. Regional development policy is aimed at ensuring economic growth and sustainability of economic development. Based on the detection and elimination of structural problems in the country, state policy focuses on forming the necessary conditions for the development of regions and raising their competitiveness. The state's regional development policy, direct and indirect coordination of long-term economic decisions in order to address the challenges posed by regional development, in some cases, income, consumption, employment, investment and so on in regions can be seen as the conscious attempts of the state directed to control over the parameters. This policy is, first of all, related to the amount of public spending on the objectives of eliminating the differences between the regions on the development of regions and the level of socio-economic development. Thus, reaching any of the goals depends on decisions about the distribution of limited economic resources. This applies directly to one of the functions of finance. Second, regional development policy covers the impact of economic agents' decisions on the location of production and investment activities. So, the activity of any subject is related to the location. From this viewpoint, the state will

have the opportunity to influence the selection of such a space. By influencing the formation of income of farmers, the state affects their decisions regarding the location of production

Method

The method of the research is based on a technical-economic analysis of the statistical data on local and regional progress and material well-being in Azerbaijan. The article uses an application-oriented approach to define areas of financing for regions.

Socio-economic development of regions in Azerbaijan

Space is an integral part of economic, social, ecological, political and cultural attitudes and processes, and their geographies define the conditions and forms of societal methods of how these processes can be developed (Markusen A. (1987) *Regions: The Economics and Politics of Territory*, Rowman and Allenheld, Totowa, NJ.). The unevenness or differentiation of the economic space has a significant impact on the state structure, the structure and efficiency of the economy, the intuitional changes and the tactics of socio-economic policy (p.41) (*Regional development: the experience of Russia and the European Union.* / A.G. Granberg, Moscow: ZAO "Izd-vo" Economics ", 2000, 435p.). Local and regional progress and material well-being depend on the continued growth of employment, income and productivity, which is an integral part of economic development (STORPER M. (1997) *The Regional World. Territorial Development in a Global Economy*. Guilford, London.). From this point of view, the concept of "regional development" is related to the change in the number of population, employment, income and value-added regional productivity. It also means social development, which includes the health and well-being of the community, the quality and creativity of the environment (*Theories of Local Economic Development: Perspectives from Across the Disciplines/Edited by Richard D. Bingham and Robert Meir.* London: Sage Publications, pp. 319. C.27). In our view, the socio-economic development of the country is related to the socio-economic development of the regions and the elimination of differences between them. Regional development depends on geographical and demographic factors, specialization and productivity, physical and human capital, infrastructure and innovation. As the factors on the regions differ, their developmental levels also differ. This situation is widespread even in developed countries. For example, in Belgium the gross domestic product (GDP) per capita in the capital is 2 times more than in the province of Flanders, 2.8 times than in the province of Wallonia, and in the Netherlands this indicator in Antwerp is 1.8 times higher than the province of Eno (*Regional policy of the EU countries.* IMEMO RAS, Moscow: 2009, 230 p. from. 14.). Studies carried out in 1995-2007 by member states of the Organization for Economic Cooperation and Development (OECD) have shown that 32 percent of economic growth has been achieved by about 4 percent of the regions. The emergence of such a situation affects the geographical position of certain regions, their natural vulnerability levels, climates, and the quality of land, but in many cases market forces deepen regional inequality.

The main purpose of the regional economic (or socio-economic) policy is to express the compromise between economic efficiency and social justice, although it is expressed in different ways in different countries (A.G.Granberg. *Bases of regional economy.* Moscow: State University Higher School of Economics, 2003, 495 pp., P. 350). For example, in most OIC member countries, regional equilibrium (justice) and efficiency (growth and competitiveness) are based on regional policies. Examples of regional balances include the priority of the development of the backward regions in Denmark, the regional balance in Finland, the territorial integrity of France, and the equal living conditions in Norway (pp. 14) (*Regional Development Policies in OECD Countries.* Paris:OECD Publishing, 2010, 388 p.). The scale of the development of the regions has a significant impact. It is assumed that the rural area has a higher position in the distribution of economic resources than cities. In such a situation, the development of infrastructure for improving the competitiveness of vulnerable regions can be ensured by the allocation of economic resources to the benefit of vulnerable regions due to the state's funding. Thus, the region's competitiveness has a significant impact on the speed and value of material, financial and information flows in that region.

Results, Conclusions and Recommendations

According to the socio-economic development of the forces, the role of the market in reducing regional inequalities is limited and this usually causes concentration of production in separate regions. Therefore, the state implements the redistribution of economic resources in favor of the regions with low development levels to reduce disproportions in the territorial structure of the national economy. In such circumstances, it is necessary to determine the criteria for the implementation of the resource allocation. For example, in the European Union, these criteria are the gross domestic product per capita, the unemployment rate and the rate of job creation, rural and agrarian regions (9. A. Cappelen, F. Castellacci, J. Fagerberg, B. Verspagen. *The Impact of Regional Support on Growth and Convergence in the European Union*. Eindhoven Centre for Innovation Studies, The Netherlands Working Paper 02.14, September 2002, 27 pp, p. 7.). Thus, in the European Union, if the per capita Gross Domestic Product in the region is 75% of the average, this region is considered to be the backward. Also, the gross domestic product per capita and the share of agriculture in employment is one of the factors that are considered in determining the state support to the regions. From this point of view, it is possible to identify the regions in Azerbaijan that need to be supported. Although the gross domestic product is not calculated in the regions, the gross output per capita on key areas in the regions in 2012 varied from 5.1 per cent to 39.1 per cent of the country's average (Except for the Nakhchivan economic region, this figure is 95.8 percent in this region). As you can see from this criterion, all regions (except for the city of Baku only) are included in the category of regions that must be supported. Also, in 2012, 37.7 percent of the employed population accounted for agriculture, forestry and fishing, which is mainly covering the regions. In this regard, supporting the development of agriculture in the regions, as well as the development of non-agrarian spheres should be prioritized.

At present, the Azerbaijani government has the necessary capacities to finance the development of the regions. Successful implementation of oil strategy has increased the volume of revenues in the country. An important part of these revenues remains at the disposal of the state. So in 2011, 50.1 percent of the remaining revenues in the country were aimed at saving and only 42.4 per cent of these resources were directed towards implementing investments across the country.

Also, 62.0 percent of total savings in the country in 2011 were at the disposal of the state, of which only 44.3 percent were used. Over the recent years, the state's overfulfilment of the consolidated budget revenues has led to an increase in the assets of the State Oil Fund of Azerbaijan. Thus, the resources of this fund will be \$ 34.1 billion USD by the end of 2012, which is approximately half of the gross domestic product.

Limitations of financial opportunities in the regions of Azerbaijan and poor development of institutional structures significantly increases the role of the state in regional development. Despite the implementation of two regional development programs in the country over the past 10 years: State Program on Socio-Economic Development of the Republic of Azerbaijan (2004-2008) and State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan in 2009-2013, the difference between Baku and other regions has not diminished significantly. Taking this into account, the Government of Azerbaijan has adopted the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018. In our view, the precise definition of regional development programs is crucial in terms of the effectiveness of the limited economic resources distribution. These goals are different in different countries. For example, the goal of a regional policy in the UK is to achieve a high and stable level of economic growth and employment across the country by providing full use of the existing potential of each region. In Poland, regional policies are aimed at supporting economic growth pole (large cities), in addition to stimulating the development of the backward regions, especially southern regions. In general, in the European Union, regional programs covering 2007-2013 include goals such as mergers, competitiveness, employment and foreign co-operation (*Governing Regional Development Policy: The use of performance indicators*. Paris: OECD Publishing, 2007, 198 p, p.34.). From this

point of view, it is important to identify the objectives of regional development programs. The main objective of the "State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018" is the continuation of measures to develop non-oil sector, diversification of the economy, rapid development of regions, especially infrastructure and social services as well as further improvements. In our opinion, the main goal here is to accelerate the rapid development of the regions (including the development of the non-oil sector and the diversification of the economy). Nevertheless, the mentioned program would provide a high tempo of economic growth by identifying development poles in the country and directing resources to the development of these poles.

To achieve the goal set out in the "State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018", it is intended to achieve further improvement of the provision of infrastructure in the regions, including the provision of communal services to the population, accelerating the development of entrepreneurship in the direction of export-oriented and competitive products, increasing the employment rate of the population, especially the rural population, and the continuation of measures to reduce the poverty level.

One of the most important tasks facing the government is to increase employment in the regions. Thus, by the end of 2012, the population in the country increased by 33.2 per cent compared to 1989 and 17.6 per cent in comparison to 1999, while the number of able-bodied population increased by 66.5 per cent and 43.4 per cent respectively. As a result, the share of those who are able to work in the total number of the population increased from 55.4 percent in 1989 to 56.8 percent in 1999, and to 69.2 percent in 2012. It should be noted that this figure reached its peak, 69.3 percent in 2011. As you can see, at present, the country has entered into the most aggressive period in terms of employment. In 2012, the share of Baku in the country's population was 23.0 percent, while its share in hired workers was 44.7 percent. Also, the latter figure increased by 1.8 percent compared to 2000. In 2012, the share of hired workers in the total number of the population was 30.7 percent in Baku, whereas in economically distant regions this figure was 11.4 percent. In particular, the rate of natural increase in rural areas in the country being relatively high, increases the importance of rural development and employment promotion. For this purpose, the following measures are envisaged in the field of employment in the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018:

- expansion of regional economic relations;
- Formation and development of a fair competition environment, ensuring compliance with labor legislation;
- directing a portion of revenues from oil exports to human capital development and applying advanced technology and innovations to the development of science-intensive industries;
- Creating a balance between the proposed workforce and the number of jobs available;
- Reduction of population migration through further development of social and communal infrastructure in rural areas;
- Increasing the level of employment of women and youth.

In general, the creation of new jobs in the country is one of the key factors that determine the economic policy of the state and it will depend on the measures taken to improve the competitiveness of the regions. One of the main directions of raising competitiveness of the regions is related to the development of infrastructure.

One of the important areas in the development of the regions is the development of transport. Investments in transport infrastructure increase the region's internal and regional ties with other regions. This leads to the improvement of conditions for production, tourism and commerce, as well as the increase in competition and concentration across the country by reducing the time of transportation as well as the quality and price ratio of transportation services. The development of transport infrastructure in the country is also a necessary condition for the specialization of regions.

It should be noted that the development of transport infrastructure has a direct, indirect, and derivative influence on the development of employment in the regions. Direct and indirect impacts are related to the creation and operation of transport infrastructure, whereas indirect impacts result from the impact of transport infrastructure on the region's competitiveness. As a result of the development of transport infrastructure, the time and cost savings, increased access to transport services, and reliability increase productivity in production. For example, the increase in the quality of motor roads can increase the vehicle lifetime and reduce its current operating costs. Also, increasing access to markets leads to increased productivity by creating new opportunities for business and raising competition. Thus, the development of transport infrastructure has a significant impact on employment and economic growth by increasing labor productivity.

The energy supply is crucial in the formation of competitiveness of the regions. Expansion of the electricity grid causes a reduction in system costs associated with investment projects in the regions. Over the past 2004-2013, 17 power plants with a total capacity of 2000 megawatt have been built in the regions, more than 10,000 kilometers of power lines and more than 1,500 substations have been constructed or reconstructed. During the mentioned period, 40,000 kilometers of gas lines were constructed or repaired in the field of natural gas supply, and the level of gas supply in residential houses reached 83.4 percent from 34 percent. At the same time, economic growth in the regions may require additional energy resources.

One of the key priorities in the development of the regions is the financing of housing and communal services. So, in most regions of Azerbaijan, in housing and utilities sector, the current level is significantly below the established norms. For example, in 2012 the average per capita housing area in Azerbaijan was 13.1 m², whereas in Sweden this indicator was 52 m², in the UK 34.5 m² and in the US 96 m². Also, the proportion of housing commissioned in the country in 2012 was about 1.9 times less than in 1990. Also, if we accept the amortization period of a residential building for 50 years, then we come to a conclusion that the depreciable part of the country's housing stock is more than 2141.2 thousand square meters of housing put into use in 2012. As it is evident, increasing the housing construction is needed to improve the living conditions of the population in the country. Also, according to a survey conducted by the State Statistical Committee in 2010, an average household in the country consumed 2966.7 kWh of electricity in 2009. This figure was less by 907.6 kWh in Nagorno-Shirvan economic region, 772.4 kWh in Guba-Khachmaz economic region, 1040.8 kWh in Sheki-Zagatala economic region, 505.8 kWh in Ganja-Gazakh economic region, 412 kWh in Nakhchivan economic region and 756.8 kWh in Lankaran economic region. In the mentioned year, the average gas consumption per household was 2143.0 cubic meters, which was less by 619.9 cubic meters in the Nakhchivan economic region, 68.0 cubic meters in the Ganja-Kazakh economic region and 426.7 cubic meters in the Lankaran economic region m, and 345.2 cubic m in the Aran economic region. In 2012, 54.8 percent of households lived in urban areas, 45.2 percent in rural areas, while households with central heating systems account for 12.8 percent, households with network gas - 75.2 percent, the water pipe share of households was 78.8%. Also, one of the priorities is the implementation of measures to improve the population's housing coverage in conditions of population growth. In this area, the continuation of reforms in the housing and communal sector in the regions, supporting the development of the real estate market, provision of low-income citizens in need of housing in the regions, including young families, reconstruction and improvement of the water supply and sewerage system measures are planned to be implemented in 2014-2018. For example, within the project "Reconstruction of water supply and sewerage system of Lankaran city", it is planned to build ultrasonic cleaning plant based on a new technology with the output of 30,000 cubic meters per day. The project envisages construction of 15,000 cubic meters of water reservoir, pumping station, 200 km of various diameter distribution network, 180 km long sewerage network and 8 sewage pumping stations.

In recent years, large-scale investments have been made in education in the regions, but this sector still remains a priority. In particular, the coverage of regions with pre-school institutions is low. For instance, in the Lankaran

economic region, the level of provision for kindergartens is 15 per cent, in Nagorno-Shirvan economic region - 8.2 per cent and it is 23 per cent in Sheki-Zagatala economic region.

Also, the calculations show that the number of seats in the regions is smaller than the numbers specified in the standard (AzDTN 2.6-1). From this point of view financing of construction of cultural facilities is one of the priority areas.

It should be noted that, in addition to investment costs in the aforementioned areas, a substantial part of maintenance costs should be provided through the state budget. From this viewpoint, it is required to link the revenues of state budget with increasing costs.

In 2012, 60.9 percent of the population in the economic regions of Azerbaijan (excluding Baku) was made up of rural population. In this regard, the social well-being of a significant part of the population depends on the development of rural areas. As already mentioned, geographically, economic growth is mainly based on scalability and concentration in certain regions and cities. That is, the regions that can not mobilize enough opportunities to obtain employment and income are left behind. From this point of view, rural areas have a number of shortcomings. Thus, rural areas do not have a density which has a positive impact on the growth of the economy in a certain space. For example, according to the definition of the Organization for Economic Cooperation and Development (OECD), if less than 150 people fall per square meter, then such communities are considered as rural communities.

If the share of the rural population exceeds 50 per cent in the region, then such region is mostly considered rural, if this share is less than 15 per cent then it is considered an urban region, and finally if it is between 15 and 50 percent, then such region is considered to be a middle-sized region...(OECD Rural Policy Reviews: Germany. Paris: OECD Publishing, 2007, 200 p, p.31.) In general, the American economist J.Makal has included the following factors limiting the development of rural areas (Magill, John (2003), "Rural Economic Development" in Sammis B. White, Richard D. Bingham and Edward W. Hill (eds.), Financing Economic Development in the 21st Century, M.E. Sharpe, Inc., New York, pp. 266-276.):

- Great distance to markets;
- Individual meetings of people living in rural areas (these meetings differ in comparison with towns);
- Limited access to capital (low competition among the rural lenders causes the capital price to be high);
- Limited scalability capabilities;
- Limited network of entrepreneurs;
- Deficiencies in information and business services;
- Restrictions on the relationships of rural economies with the rest of the economy;
- Lack of qualified personnel.

The above mentioned bring the state promotion of rural development to the fore. Also, agriculture is a key element of rural livelihood and is closely linked to other economic, environmental and social development forces in these regions. From this point of view, the development of agriculture affects the well-being of the rural population. In 2012, 37.7 percent of the employed population accounted for agricultural, fishing and forestry, whereas those employed were 38.4 percent of those living in rural areas. Also, about 59.1 percent of the working-age population living in rural areas operated in this area. In 2012, the economically active population in the country was 50.4 percent of the total population. Given these figures, estimates show that around 76 percent of the economically active population in rural areas are involved in agriculture, fishing and forestry. It should be noted that in the countries included in the Organization for Economic Cooperation and Development, only 10% of existing labor resources in rural areas are engaged in agriculture and forestry, and their support is needed (The New Rural Paradigm: Policies and Governance. Paris: OECD Publishing, 2006, 168 p, p.13.). At the same time, income per capita in agriculture is typically lower than in other sectors of the economy. So in 2012, an average of about 135 AZN added value was created per month for a person engaged in agriculture, fishing, and

forestry, then we come to the conclusion that in rural areas income from employment is relatively small. From this point of view, the state is required to support rural areas as well as agriculture.

The measures to support the development of the agricultural sector are multilateral. Thus, the development of the agricultural sector affects food security, raw material supply, and ecological status. Thus, in 2012, 55.1% of the country's land was used for agricultural purposes, and 29.9% of these land areas were irrigated lands. From this point of view, agriculture has the potential to reduce land quality and to seriously affect water pollution. In such circumstances, policies for agricultural development should include environmental protection and biodiversity conservation. Also, since rural areas are at a distance from major markets, due to the low concentration in these places, infrastructure density and development levels are low, thus causing additional costs comparing to urban areas. Therefore, it is necessary to provide a state support to the development of rural areas, especially the agricultural sector.

A modern approach to rural development envisages the implementation of large-scale investment projects, along with granting subsidies to the development of regions dominated by agriculture. These investments are made in order to create favorable conditions for living in the regions and to increase their competitiveness. This is related to the provision of necessary production and social infrastructure to rural areas. Also, the competitiveness of the agricultural sector depends largely on the development of the fields serving this area and staffing. In this regard, establishment of warehouses in the regions, agro-services serving agriculture, improving the quality of veterinary and phytosanitary services, seeds, fertilizers and pesticides, development of necessary sales channels, such as the organization of information and communication services for agricultural producers, are factors that determine the competitiveness of the agricultural sector.

Development of agricultural products processing industry in regional centers and rural areas plays an important role in the provision of developing rural areas. There are great opportunities for the development of the food industry in the republic. Thus, in 2012, the volume of production of food products, including beverages, amounted to about 25 percent of the 1990 level and this decline was mainly due to a decrease in the production of export-oriented food products. Also, the complex processing of raw materials in the food industry is of crucial importance. Thus, in the processing of agricultural raw materials, products and production waste are also obtained along with the main product. For example, except for meat products, the waste of cut animals - hair, nails, horns, bones, gut, blood, etc. are also obtained in meat production. These waste products are used in various types of products (combinations, buttons, brushes, musical instruments etc.) and more than 40 medicines, animal feeds and so on. can be produced by using these wastes. The absence of waste recycling facilities reduces the efficiency of production. Therefore, the complex development programs for separate areas of food products should be developed in the republic, and this program should take into account the processing stages of agricultural raw materials.

In general, the development of small and medium-sized businesses on the basis of administrative district centers is crucial for the creation of developmental poles in the country. Meanwhile, the specialization of agricultural products in separate regions, the creation of specialized warehouses, transportation economies and processing facilities can play an important role in the development of the regions.

Along with the food industry, there are available opportunities for the development of light industry, mechanical engineering and metallurgy industry, building materials industry in the regions. It should be noted that the development of local raw materials based on the "State Program on socio-economic development of the regions of the Republic of Azerbaijan in 2014-2018" has been identified as a priority in this area. Nevertheless, it would be expedient to further define industry development opportunities within the framework of the mentioned program. In our view, it is required to conduct research in the following areas to identify industry development trends:

- available natural resources and their estimated quantities in the country;
- structure and volume of agricultural production;
- volume of future demand for certain consumer products;
- volume of import;
- successfully developing industries in countries with similar volume and structure of existing financial, labor and natural resources;
- possible interaction of the existing fields in the country with local and foreign related areas;
- opportunities for development based on vertical or horizontal integration of existing production;
- possible diversification of existing production;
- capacity to increase production volumes due to the scale of production.

It should be noted that there are limited opportunities for the development of many areas of industry at the expense of only domestic market. Only industrial products that are oriented to the domestic market ultimately lose capacity to scale-up and are not competitive in the long term. Therefore, it is possible to develop the country's industrial potential by creating relatively large industrial companies. At present, the creation of such industrial companies in the country is mainly possible with state participation and financial support. In such circumstances, certain actions can be taken in specializing in certain industries of separate regions in the country. In recent years, the black and non-ferrous metallurgy industry in the country has been primarily developed in the Ganja-Gazakh economic region. In our opinion, while the areas of food and light industries are mainly developed in line with their specialized agricultural products in the regions, it is advisable to develop industrial production based on raw materials and employment factors.

The role of staff in achieving success in the above-mentioned direction is crucial. Therefore, the training of staff and raising their knowledge and skills in the country should be one of the main directions of government policy. In recent years, state funding of education in foreign countries, the development of vocational education and etc. steps are among the measures taken in this direction. Nevertheless, the development of separate regions should be clearly defined and the training of personnel in these areas should be financed.

Thus, direct and indirect financial support of the state is required in these areas. Determination of the role of the state in the financing of socio-economic development of the regions is also made based on the evaluation of the opportunity to participate in this development of the private sector. Thus, regional policy in Azerbaijan is aimed at raising competitiveness in the regions, creating new jobs and increasing social security. Measures in this direction cover both economic and social and environmental issues. Since 2004, regional development programs in Azerbaijan have led to an increase in the overall level of development of the regions, but did not substantially reduce the difference between Baku and other regions due to the level of income. Meanwhile, five-year regional development programs implemented since 2004 have played a crucial role in mobilizing financial resources and promoting regional development.

Abstract

The study which aimed to identify whether teacher perceptions on argumentativeness affected their organizational dissent perceptions was conducted by using the relational screening model. The study group was composed of 148 teachers employed at primary, secondary and high schools in Yeniçağa District of Bolu during 2018-2019 academic year. Argumentativeness Scale and Organizational Dissent Scale were used to collect data. Teachers were found to display high level perceptions about argumentative approach while they had moderate level perceptions about argumentative avoidance and they displayed high level perceptions for organizational dissent in general and in all its subscales such as vertical, horizontal and displaced dissent. While argumentative approach was found to affect organizational dissent as well as vertical dissent, it had no effect on displaced dissent. It was found that argumentative avoidance affected displaced dissent but had no effect on organizational dissent and vertical dissent. Argumentative avoidance and argumentative approach were found not to affect horizontal dissent.

Key Words: Teacher, Argumentativeness, Dissent, Organizational Dissent

Introduction

People continue their lives by establishing organizations in communities to meet their needs. Organizations can achieve their goals and fulfill their functions only by following certain policies and implementing specific practices. However, employees in organizations may not always be satisfied despite these policies and some of the implemented practices and by presenting new ideas; they may criticize these practices and express viewpoints that show that their opinions differ from their administrators or colleagues. In this process some employees are more capable, willing and energetic in expressing different ideas while some of them may even avoid expressing dissent.

Discussion, an important concept for the development of thinking skills of individuals, is a well-intentioned activity that includes reasoning and decision making (Stewart and Roach, 1998) and it is at the center of argumentativeness and the basis of persuasion process (Rancer, 2004). Argumentativeness is used for an individual's position, stance and defense regarding the subject of discussion and it is used as an attempt to refute the position of the opposing party (Infante, Rancer and Womack, 2003; Rancer, 1998). While individuals that are high in argumentativeness have low motivation to avoid discussions; those that are low in argumentativeness are highly motivated to avoid discussions. Therefore, individuals that are high in argumentativeness display a high tendency to argue and discuss (Hamilton and Mineo, 2002) and people that are low in argumentativeness tend to display a low tendency in this respect (Rancer and Avtgis, 2006). Compared to people that are low in argumentativeness, individuals that are high in argumentativeness are more motivated to convince the other party in the persuasion process (Infante, Step and Horvarth, 1997, cited in: Turunç, Eser and Dinç, 2018). In addition, individuals that are high in argumentativeness may use argumentative elements in communication with less anxiety and see discussion as an exciting action (Rancer & Avtgis, 2006). Individuals that are low in

argumentativeness are indifferent to this concept and avoid discussions. When they face such challenging situations, they want to direct the issue to social and emotional problems. Even if they are persuaded to argue, they are shy in expressing the situations/events that they are not satisfied with. They refrain from discussions by using redundant sentences in communication to a lesser extent and believe that they may be unsettled to talk about controversial issues (Rancer and Avgtis, 2006).

In terms of organizational climate, argumentativeness is a phenomenon that contributes to organizational development when effectively managed in an environment established by members but may cause harm when it is not managed well. Administrators in organizations need their employees' input and opinions to make the right decisions, respond to rapidly changing environmental conditions and solve problems (Morrison, 2011; cited in: Ökten and Cenkçi, 2013). In this respect, it is very important for administrators to exhibit positive argumentativeness traits and trust themselves while they dissent/challenge their employees. As a matter of fact, dissent has a great role in protecting the rights and freedoms of individuals as long as it does not turn into destructive and violent behavior (Dağlı, 2015). In this context, it can be claimed that the concept of employees' argumentativeness is important in the process while discussing their organizational dissent behaviors because individuals that are high in argumentativeness use argumentativeness to access information, prevent and reduce conflict (Rancer, Baukus and Infante, 1985) by identifying the trait as productivity and playful efforts (Rancer, Kosberg and Baukus, 1992). On the other hand, individuals that are low in argumentativeness try stay away from discussions because they characterize it as negative and hostile (Rancer et al., 1985) and they can either avoid dissent or exhibit negative behaviors. In this sense, it can be assumed that there is a relationship between argumentativeness and organizational dissent.

Dissent, which means employees' opposition towards an idea, an action or an attitude in their organizations, is defined at the organizational level as employees' voicing a number of conflicts in their organizations and expressing their opinions about organizational practices and policies (Kassing, 1998). Organizational dissent also means employees' disapproval for policies, practices and behaviors adopted by their administrators by protesting and objecting (Özdemir, 2010). Generally, members of an organization express their dissent after perceiving that there is a problem in their organizations. During this perception process, they realize the seriousness of the problem and start thinking of the reaction they will receive when they express dissenting opinions (Graham, 1986). The dissent process which explains why and how employees express opposition has four phases. In the first phase, the employee distinguishes his/her opinion from that of the organization and this separation of opinions emerges as a triggering factor. After the second phase in which the employee focuses on individual, relational and organizational factors that affect the decision of dissent and the selection of methods to express dissent, the employee considers the risks of being a dissident. The process ends when the employee shares his/her dissenting thoughts with other employees (Kassing, 1998). Organizational dissent is caused by the imposition of injustice, infringement of employee rights, issues about the methods of decision-making, ineffectiveness in the organization, problems related to duties and responsibilities, resources, ethics and performance evaluation, inability to prevent harm and the concept of organizational change (Kassing and Armstrong, 2002).

Kassing (1998) addressed organizational dissent in three forms as vertical, horizontal and displaced dissent. Vertical dissent is directly expressed for top executives in the organization; horizontal dissent is expressed for those who are hierarchically in the same status in the organization as the dissident and displaced dissent is expressed for individuals that are external to the organization (Kassing, 1998; Kassing, 2011).

Dissent behaviors are as important as argumentativeness in organizations that aim to ensure development and continuity since these behaviors provide input gained from different ideas and opinions. Although dissent is associated with unfavorable concepts such as conflict and disagreement, it is an important element of

communication and development since it provides employees with feedback. Thanks to dissent, those who correctly identify problems experienced in organizations can present factual and functional solutions in a more realistic way to those who face problems. On the other hand, employees can propose solutions and show opposition only within a fair and democratic organizational structure (Kavak and Kaygin, 2018). Therefore, organizational dissent not only contributes to the development of democracy in organizations but also to the identification, prevention and solution of problems (Kassing, 2002; Özdemir, 2010) and to the renewal of the organization (Özdemir, 2010).

Argumentativeness can be addressed as a dissent behavior because it expresses the tendency of individuals to defend their positions regarding controversial issues in the communication process and to verbally target the position and stance of the other party (Infante and Rancer, 1982). This study conducted in line with this argument aimed to reveal the relationship between argumentativeness and organizational dissent and to guide the practitioners by contributing to literature with the help of the obtained results. The literature review for this study presented no prior investigations, especially in educational institutions, on the relationship between teachers' argumentativeness and organizational dissent perceptions or the effects of teachers' argumentativeness on their organizational dissent perceptions. In this context, this study aimed to identify teacher perceptions on argumentativeness and organizational dissent and to determine whether teacher perceptions on argumentativeness affected their perceptions on organizational dissent. Answers to the following questions were sought in this research:

-What are teacher perceptions on argumentativeness and organizational dissent?

-Do teacher perceptions on argumentativeness predict their perceptions on organizational dissent?

Method

Research model

This study which aimed to identify teacher perceptions on argumentativeness and organizational dissent and to determine the effect of teacher perceptions on argumentativeness on their organizational dissent perceptions was carried out by utilizing the relational screening model (Karasar, 2005).

Study group

The study group in this research consisted of 148 teachers employed at primary, secondary and high schools in Yeniçağa district of Bolu province in the 2018-2019 academic year. Some demographic information regarding the participating teachers is as follows: 78 of the teachers were male and 70 were female. Of the participants, 81 were classroom teachers and 67 were branch/subject matter teachers. In terms of seniority, 28 participants had 1-5 years teaching experience, 30 had 6-10 years, 46 had 11-15 years and 44 had 16 years or more seniority. 135 teachers had undergraduate degrees whereas 13 had graduate degrees.

Data collection method and instrument

A scale composed of two parts was used to collect data in this study. The first part included 4 items related to teachers' demographic characteristics. The second part included the short form of "Argumentativeness Scale", which was developed by Infante and Rancer (1982) and whose validity and reliability analysis was conducted by Turunç, Eser and Dinç (2018) and the "Organizational Dissent Scale" which was developed by Kassing (1998) and adapted to Turkish by Ergün ve Çelik (2018) who also conducted the validity and reliability analysis of the scale. Argumentativeness Scale has two dimensions as *approach* and *avoidance*. Researchers stated that it would be more useful if the two dimensions of the scale were evaluated separately instead of holistically. The Likert scale rates the items on a 5-point scale from *never* to *always* and the Cronbach's Alpha coefficient for both dimensions is calculated to be 0.71. This study determined the reliability coefficient of approach dimension as .80 and the reliability coefficient of avoidance dimension as .82. Organizational Dissent Scale is also a five-point Likert scale rated from *completely disagree* to *completely agree*. The Cronbach Alpha coefficient of the scale is

.96 for vertical dissent dimension, .95 for horizontal dissent dimension, .97 for displaced dissent dimension and .96 for the entire scale. The result of the reliability analysis performed in this study determined the reliability coefficient as .92 for vertical dissent dimension, .91 for horizontal dissent dimension, .93 for displaced dissent dimension and .92 for the entire scale.

Data analysis

Before data analysis, normality was examined by Kolmogorov-Smirnov test and it was found that the data displayed normal distribution. According to this result, means and standard deviation were used to determine teacher perceptions on argumentativeness and organizational dissent and regression analyzes were conducted to determine the effect of the teacher perceptions on argumentativeness on their organizational dissent perceptions.

Findings

Table 1 displays teacher views on argumentativeness sub scales.

Table 1. Teacher views on the sub scales of argumentativeness

Scale	N	\bar{X}	SD
Argumentative approach	148	4.01	0.72
Argumentative avoidance	148	2.84	0.83

According to Table 1, teachers had high perception levels in regards to argumentative approach ($\bar{X}=4.01$) while they had moderate levels of perception ($\bar{X}=2.84$) for argumentative avoidance.

Table 2 displays teacher views on organizational dissent in general and its sub scales.

Table 2. Teacher views on organizational dissent

Scale	N	\bar{X}	SD
Vertical Dissent	148	4.25	0.67
Horizontal Dissent	148	4.39	0.71
Displaced Dissent	148	4.42	0.85
Organizational Dissent Total	148	4.33	0.59

*p<0.01

According to Table 2, teachers had high perception levels for organizational dissent in general ($\bar{X}=4.33$) and its sub scales: vertical dissent ($\bar{X}=4.25$), horizontal dissent ($\bar{X}=4.39$) and displaced dissent ($\bar{X}=4.42$).

Table 3 displays the results of the multiple regression analysis conducted to determine whether teachers' argumentative approach and argumentative avoidance perceptions predicted their horizontal dissent perceptions.

Table 3. Results of the multiple regression analysis conducted to determine whether argumentative approach and argumentative avoidance perceptions predicted horizontal dissent perceptions

Dependent variable	Independent variable	β	t	p	F	p	R ²
	Fixed	1,38	4,86	0,00			
Horizontal dissent	argumentative approach	0,35	3,29	0,00	54,192	0,0	0,48
	argumentative avoidance	0,04	0,39	0,00		0	

*p<0.01

Examination of Table 3 for the results of regression analysis to see whether argumentativeness sub scales predicted horizontal dissent, a sub scale of organizational dissent, shows that argumentativeness sub scales significantly predicted horizontal dissent ($F=54,192$; $p<0,01$). Argumentativeness sub scales predicted about 48% of the total variance in horizontal dissent ($R^2=0,48$). Examination of p values pointed to the fact that argumentativeness sub scales were

significant predictors of horizontal dissent ($p < 0,01$).

Table 4 displays the results of the multiple regression analysis conducted to determine whether teachers' argumentative approach and argumentative avoidance perceptions predicted their vertical dissent perceptions.

Table 4. Results of the multiple regression analysis conducted to determine whether argumentative approach and argumentative avoidance perceptions predicted vertical dissent perceptions

Dependent variable	Independent variable	β	t	p	F	p	R^2
	Fixed	1,08	4,80	0,00			
Vertical dissent	argumentative approach	0,42	3,79	0,00	53,16	0,00	0,53
	argumentative avoidance	-0,02	-0,23	0,78			

* $p < 0,01$

Examination of Table 4 for the results of regression analysis to see whether argumentativeness sub scales predicted vertical dissent, a sub scale of organizational dissent, shows that argumentativeness sub scales significantly predicted vertical dissent ($F=53,16$; $p < 0,01$). Argumentativeness sub scales predicted about 53% of the total variance in vertical dissent ($R^2=0,53$). Examination of p values pointed to the fact that while argumentative approach sub scale was a significant predictor of vertical dissent ($p < 0,01$), argumentative avoidance sub scale did not have a statistically significant predictive value on vertical dissent ($p > 0,01$).

Table 5 displays the results of the multiple regression analysis conducted to determine whether teachers' argumentative approach and argumentative avoidance perceptions predicted their displaced dissent perceptions.

Table 5. Results of the multiple regression analysis conducted to determine whether argumentative approach and argumentative avoidance perceptions predicted displaced dissent perceptions

Dependent variable	Independent variable	β	t	p	F	p	R^2
	Fixed	1,01	7,23	0,00			
Displaced dissent	argumentative approach	-0,06	-0,39	0,71	65,30	0,00	0,57
	argumentative avoidance	0,34	3,52	0,00			

* $p < 0,01$

Examination of Table 5 for the results of regression analysis to see whether argumentativeness sub scales predicted displaced dissent, a sub scale of organizational dissent, shows that argumentativeness sub scales significantly predicted displaced dissent ($F=65,30$; $p < 0,01$). Argumentativeness sub scales predicted about 57% of the total variance in displaced dissent ($R^2=0,57$). Examination of p values pointed to the fact that while argumentative avoidance sub scale was a significant predictor of displaced dissent ($p < 0,01$), argumentative approach sub scale did not have a statistically significant predictive value on vertical dissent ($p > 0,01$).

Table 6 displays the results of the multiple regression analysis conducted to determine whether teachers' argumentativeness predicted their organizational dissent perceptions.

Table 6. Results of the multiple regression analysis conducted to determine whether argumentative approach and argumentative avoidance perceptions predicted organizational dissent perceptions

Dependent variable	Independent variable	β	t	p	F	p	R^2
	Fixed	1,41	5,87	0,00			
Organizational	argumentative approach	0,38	10,19	0,00	61,01	0,00	0,46

dissent	argumentative avoidance	-0,04	-0,51	0,71
---------	-------------------------	-------	-------	------

*p < 0.01

Examination of Table 6 for the results of regression analysis to see whether argumentativeness sub scales predicted displaced dissent, a sub scale of organizational dissent, shows that argumentative approach, a sub scale of argumentativeness, significantly predicted organizational dissent ($F=61,01; p<0,01$). Argumentative approach predicted about 46% of the total variance in organizational dissent perceptions ($R^2=0,46$). On the other hand, argumentative avoidance sub scale did not have a statistically significant predictive value on organizational dissent ($p>0,01$).

Results, Conclusions and Recommendations

Teacher perceptions on argumentative approach, a sub scale of argumentativeness were high, while their perceptions on argumentative avoidance were moderate. The fact teachers display argumentative approach for school practices is regarded to be highly positive for school administrators for whom different opinions the school environment are important. Therefore, it can be argued that high levels in this regard are positive because teachers who follow an argumentative approach can criticize the failures of school practices without hesitation and it will be favorable for the development of the school. Teachers sometimes want to avoid discussions because they do not want to share opinions about the issues that may disrupt the school environment, they do not have information about the situations in question or consider themselves inadequate, they fear the administrators and they do not want to talk to everyone about what they think and feel.

Teacher perceptions regarding organizational dissent in general and their perceptions on its sub scales such as vertical dissent, horizontal dissent and displaced dissent were high. While dissent behaviors may harm the school environments in which there are autocratic school administrators, teachers' positive dissent behaviors at schools where there is a democratic and supportive management style will contribute to the school environment and climate. As a matter of fact, decisions taken in organizations can be of higher quality thanks to opposition (Dooley and Fryxell, 1999; Landier, Sraer and Thesmar, 2009). In this respect, high level perceptions regarding vertical dissent may be considered as positive. In addition, opposition to managers is not a condition to be worried about since it can be considered as an indicator of employee commitment and responsibility (Oral Ataç and Köse, 2017). In this sense, teachers' high vertical opposition perceptions can be perceived as a positive result because teachers who exhibit opposing behaviors towards problems in making decisions and implementing practices because they are aware of the procedures at the school and the educational activities and feel responsibility. Hence, this situation can be regarded as normal because it is very important for employees to express their ideas, thoughts and suggestions about organizational and managerial activities in terms of organizational functioning (Sadykova and Tutar, 2014). In addition, high teacher perceptions in regards to organizational dissent and its sub-dimensions will provide opportunities to eliminate setbacks during the implementations of school policies, to nourish the emergence of new ideas and to enable making common decisions. Dağlı and Ağalday (2018) support the findings of this research. However, some studies (Özdemir, 2010; Yıldız, 2014; Dağlı and Ağalday, 2014; Akada, 2015; Korucuoğlu, 2016) identified low or moderate employee perceptions in regards to organizational dissent. Findings that point to variations in different studies may be due to differences in school administrators' management styles, school culture and climate.

In order to succeed in their professions, it is important for school administrators to be aware of the positive developments in their organizations as well as the negative ones. One of the factors that affect success is correcting and amending areas that include problems. Opposition is an important tool for managers to be aware of problems. Administrators can learn a lot from different perspectives and opinions at schools and decide whether what is implemented is correct or not (Ergün and Çelik, 2018). In addition, it is thought that school administrators' openness to opposing paradigms is important for the change, development and innovation of schools. Also, this behavior can contribute to the formation of a democratic society and democratic schools, as

well as helping those teachers who avoid arguments or confrontation to overcome their fears and anxiety and support them to share their criticisms and opinions. However, it should be taken into consideration that there are administrators who do not regard opposition as positive but as an attack on their professional positions (Berber, 2013; Devine and Maassarani, 2011). Administrators with this perspective will not only fail to manage opposing viewpoints, but will also create an unfavorable environment.

It was found that sub scales of argumentativeness had a statistically significant effect on horizontal dissent, a sub scale of organizational dissent. Avoidance and approach forms of argumentativeness were significant predictors of horizontal dissent. As a matter of fact, since horizontal dissent behavior occurs mainly when the employees think that they are perceived as enemies or rivals within the organization (Kassing, 1998), employees may have pursue avoidance for fear that they will lose benefits and interests. Such thoughts may lead them to share their ideas with their fellow teachers because teachers who have a tendency to discuss options and are willing to argue may not want to share some situations with their administrators with concerns about the reactions that they will get. Therefore, they will prefer to express their dissent by talking to other teachers about the situations in question. As a matter of fact, teachers with high argumentative approach styles who enjoy discussions and arguments may display negative behaviors when they cannot express themselves.

While argumentative approach, a sub scale of argumentativeness, was found to significantly predict vertical dissent, a sub scale of organizational dissent, argumentative avoidance was not found to be related to vertical dissent. Since teachers who are energetic and enthusiastic in regards to talking about a controversial subject, who enjoy discussing and defending their views will be highly motivated to persuade others and hence they can question school administrators and school policies by making these situations positive and encouraging. They can make suggestions for correcting the setbacks and solving the problems at their schools. When there an unfair situation unfolds at the school, they can report it to their administrators, express their disagreements and contribute to innovation and change by stating their own ideas. Therefore, dissent can become an important instrument that can provide self-regulation, democracy, justice and organizational innovation at schools (Özdemir, 2013). However, when teachers follow argumentative avoidance style, there will be no contradictions or conflicts at the school, preventing the school to be open to development and change and hindering the formation of a democratic school environment. At the same time, employees argumentative approach style may have to pay heavy prices in this process as a result of their dissident behaviors (Uys, 2008). The reason why teachers stay away from dissent by exhibiting avoidant styles may be related to their shying from paying the price. However, if school administrators can guide teachers with argumentative approach style to vertical dissent behaviors, they can provide an opportunity to compete with other schools by providing more rapid change and innovation and will also show that those who are exhibiting avoidance behaviors will not experience adverse results.

While argumentative avoidance, a sub scale of argumentativeness, was found to significantly predict displaced dissent, a sub scale of organizational dissent, argumentative approach style did not affect displaced dissent. It may be considered normal for teachers who display avoidance to exhibit displaced dissent behaviors since they do not wish to take part in a controversial situations and therefore direct the subject to emotional issues. As a matter of fact, teachers who do not want to engage in discussions at the school will want to talk about their problems with their friends and family outside the school rather than their colleagues because the teachers with this argumentative style will be worried that the people around them may get a negative impression and they may not want to be together with teachers who do not agree with their ideas. Therefore, it may be natural for teachers who are in this situation to explain their dissent behaviors to their friends and family rather than their colleagues by avoiding vertical or horizontal dissent behaviors at the school.

While the argumentative approach had a statistically significant effect on organizational dissent, argumentative

avoidance did not predict organizational dissent. Teachers with argumentative avoidance style may think that the discussion will affect them negatively and this type of thinking may stop them from exhibiting dissent behaviors. On the other hand, teachers with argumentative approach have high motivation for discussion, feel energetic and enjoy discussions and therefore it will be easier for them to exhibit organizational dissent behaviors. It is expected that constructive opposition has a positive contribution in making the right decisions and in solving problems in organizations with common sense (Morrison, 2011). Teachers should have argumentative approach style in order to ensure the existence of constructive opposition at schools. In addition to providing the development and satisfaction of teachers, the opposition provides them with different paradigms and approaches (Sadykova and Tutar, 2014). For this reason, positive and constructive dissent behaviors of teachers with argumentative approach style are regarded to be positive in terms of the effectiveness of the school. Administrators can contribute to the development of their schools by caring about the positive and constructive dissent behaviors and turning these behaviors into opportunities.

The following suggestions were developed in line with study results:

- School administrators should create a school culture and climate in which teachers can demonstrate argumentative approach behaviors that may benefit the school.
- With the help of their administration styles, school administrators should create an environment in which teachers can share vertical dissent views and display argumentative approach behaviors and vertical and horizontal dissent behaviors in order to achieve success in school policies, education and training activities, in making joint decisions, in uncovering different ideas and identifying and eliminating problems at their schools.

Abstract

Mobile technology in education is becoming an increasingly interesting option for the future. Smart and personal access to interactive multimedia content (IMC) requires a developed infrastructure for present and future Smart Cities. The arrival of 5G technology will significantly improve the existing smart learning models and enable significant involvement of IoT technology. Connecting IoT within 5G mobile networks will enhance Smart Learning Environments (SLE) for each user. SLE is physical and virtual environment that provides faster access to IMC, enriching the environment with contextual and adaptive digital devices that provide situations, events, interventions and perceptions needed to encourage users to learn, know, and resolve situations (identification), actively and virtually interact with the group, exercise and think. All these elements will not be able to provide adequate quality through existing models without an active student model supported by IoT technology. This paper discusses the possibilities and future implications of the new 5G technology, ubiquitous computing and IoT as components of Smart learning environments.

Keywords: mobile technology, personal smart learning environments, 5G, student models, contextual model

Introduction

The possibilities mobile technology currently offers have significantly improved the way people use computer technology in their everyday life. The reason for this is that mobile devices have, due to their availability, finally become "personal devices", and they now provide their users with a way to continuously interact and communicate with their device and its online and offline features. The development of mobile networks bandwidth has also allowed users to access various types of network content, communication and entertainment in a multimedia-based and interactive way. Today, we are witnessing the introduction of 5G mobile technology, something that will enhance this experience even further.

Apart from providing increased speed, it is expected that 5G will support the development of Internet of Things' (IoT) ecosystem, where networks could be used to satisfy the communication needs of billions of interconnected devices. These services will support a compromise between speed, bandwidth, latency and expenses (Mavromoustakis, Mastorakis, & Batalla, 2016). Unlike current standards, 5G introduces several important features such as low latency, allowing users to interact in real time, which is important for cloud services; low energy consumption, ensuring the longevity of quality services; and significant increase in mobile networks' speed and bandwidth. These features are the basis for future use of IoT devices and technology.

Eloff wrote about the Internet of future as far back as ten years ago: "The Future Internet will be based on mobile technology and consist of billions of digital devices, people, services and other physical objects having the

potential to seamlessly connect, interact and exchange information about themselves and their environment " (Eloff, Eloff, Dlamini, & Zieliński, 2009). Ten years later, this vision is becoming a reality. This is preceded by a continuous development of technology, but also by the development of a society able to accept technological changes. While this vision was quite advanced in its day and age, it is now a logical continuation of human society's and technology's evolution. In this and future synergistic development of society and technology, also known in scientific literature as IoPTS (Internet of People, Things and Services), i.e. Internet of People (IoP), Internet of Things (IoT) and Internet of Services (IoS), Internet of People shows how Internet of Things and Services will be used in the future (Al-Fuqaha, Guizani, Mohammadi, Aledhari, & Ayyash, 2015; Ejaz & Anpalagan, 2019).

Internet of Things and the smart learning environment

Advances in the field of mobile technology have directly impacted the development of IoT (Internet of Things) technology, which has become an important part of future Smart City environments. There are several points of view concerning IoT's definition, but one of the most precise and most complete ones is given by Gartner Inc¹, a research and advisory company, which states: "The Internet of Things (IoT) is the network of physical objects that contain embedded technology to communicate and sense or interact with their internal states or the external environment". In fact, we can consider various physical devices (objects) which possess the technology that allows them to collect data from their surroundings, have the ability to process data and based on that "communicate" or act in their environment. The number of those devices is continuously rising, and their number, type, place and purpose will surpass all our expectations in the future (Kale, 2018; Sun, Wang, & Ahmad, 2017). Apart from these basic functions the devices possess, we can expect to see new, interesting and more demanding features which will greatly rely on artificial intelligence (Sun et al., 2017). The development of this information and communication ecosystem has only just begun, and judging from the feats achieved so far, we can expect to see an advanced IoT information and communication ecosystem.

This unique environment composed of ubiquitous IoT devices creates an ICT environment that can significantly impact and advance learning and teaching processes. In such an environment we cannot be satisfied with mere access to information and simple learning and teaching support. Rather, we should aim for active participation in the learning process through guiding every student, by means of active instructions, by using proactive learning suggestions whose aim is to support and entice students in the right moment. It is therefore necessary to think about creating a "smart environment" that will entice learning and teaching processes. Even Ilkyu Ha and Chonggun Kim considered a smart learning environment to be a combination of technology and pedagogy whose goal is to create an ecosystem designed to provide evidence about changes in knowledge in real time and the sustainability and acquisition of skills which are imperceptibly transferred onto students when they move from one learning context into another (Bădică & Nguyen, 2013). Many authors, such as Chin (1997), state that a smart learning environment is focused on the student and based on applied information and communication technology. Chin states that this technology must have the following features: it should be able to adapt to different learning styles and abilities, provide support to students' development and support lifelong learning. This specific environment must contain modern pedagogical aspects and knowledge (Chin & Chen, 2013). The pedagogical aspects are aimed at the most recent research in the field of applied ICT technology in learning and teaching processes (Daniela, 2019; Lorenzo & Gallon, 2019).

Creating a smart learning environment for every student therefore becomes an intriguing idea we must aspire to. Authors such as Koper believe that smart learning environments are primarily physical environments enhanced with digital devices and adaptable contexts, with the goal of promoting better and faster learning (Koper, 2014). Klimova (2015) defined the concept of SLE as a smart learning environment supported by technology that can

¹ <https://www.gartner.com/it-glossary/internet-of-things/>

make adaptations and provide adequate support (L. Uskov, Howlett, & Jain, 2015). According to Zhu, it is emphasized that intelligent learning is based on two different types of technology, (1) intelligent devices and (2) intelligent technology (Z.-T. Zhu, Yu, & Riezebos, 2016). Zhu et al. set basic features of a smart learning environment through location awareness, context awareness, interoperability, seamless connection, adaptability, and ubiquitousness (Z. T. Zhu & Bin, 2012).

It is necessary to emphasize here that this paper stresses that smart learning environments have to become personal smart learning environments. Personal smart learning environments thus become interesting environments focused on an individual. The concepts of a smart classroom and a smart learning environment aim to make students' environments more efficient, adaptable and interesting. We can also view the smart learning classroom concept as a potential integration of individual smart environments. The model proposed here only partially considers this possibility, but it does provide further steps for developing a future model.

In accordance with these basic ideas, Zhu et al. created and described key elements that determine smart education as a product of a smart learning environment: location awareness (in smart learning, the location in real time is important data the systems need in order to adapt the content and situation to the student); context awareness (exploring different activity scenarios and information); social awareness (sensing social relationships); interoperability (setting standards for different resources, services and platforms); seamless connection (providing continuous service when any device connects); adaptability (pushing learning resources according to access, preference and demand); ubiquitousness (predicting student's demands until clearly expressed, providing visual and transparent access to learning resources and services); record completeness (recording learning path data to mine and analyse in depth, then providing reasonable assessment, suggestions and pushing on-demand service); natural interaction (transferring the senses of multimodal interaction, including position and facial expression recognition); high engagement (immersion in multidirectional interactive learning experiences in technology-enriched environments) (Z.-T. Zhu et al., 2016).

Zhu et al. also propose an interesting model of a smart environment set in an interesting surrounding. If we analyse the elements of the model, we can see that it is not completely focused on an individual but on the smart learning environment. The proposed elements are predictors which can point to future development of technology, adaptability and future focus on an individual and social environment. However, the question that has to be raised is whether the proposed model can be adapted to each and every student. Can every student, with all their specificities, fully utilize the elements?

Hwang created a smart learning environment model composed of the following modules:

- A learning status detecting module (which detects learners' real-world status, such as locations and learning behaviours, and environmental contexts such as temperature and humidity).
- A learning performance evaluation module (records and evaluates learner's performance).
- An adaptive learning task module (assigns learning tasks to learners based on their learning progress, learning performance, personal factors and their learning objectives).
- An adaptive learning content module (based on the learning progress, learning performance and other factors, the learning system recommends and organizes learning materials).
- A personal learning support module (learning support to learners based on their learning needs).
- A set of databases for keeping the learner profiles, learning portfolios, learning sheets (the learning portfolio databases contain students' learning schedules, learning progress, homework, assessment results and their interactions with peers and the learning system etc.).
- An inference engine and a knowledge base for determining the "value" of the candidate's learning tasks, strategies and tools as well as their possible combinations. The knowledge base is a collection of the tutoring knowledge and the experience of educators and learners. It can also contain decision-making rules generated

by analysing previous cases, including successful and unsuccessful ones.(Hwang, 2014)

Hwang's model is fully focused on the student and provides continuous support to the learning process. However, the model bases its support on strictly defined support systems and subsystems. The environmental context doesn't have an active role here, i.e. it does not support the interaction of the environment, only the strict subsystems inserted in the information-communication support system. The new ICT ecosystem developed within the confines of the new 5G broadband internet, such as IoT, ubiquitous computing, cloud computing etc., will provide new ways of accessing information from the environment, ways that are connected by different systems. It is a whole new ecosystem.

The personal smart learning environment model

IoT smart environments represent the basic element of creating a contextually aware environment. IoT information system promotes creation and usage of context-aware apps which can adapt to environment context, with or without user's intent. Context is therefore important because it has the primary role in executing apps within the IoT information system and in collecting important parameters during the interaction between users and their environment and forwarding that information to other elements which are of importance to the user (Das & Almhana, 2018). According to Dey, a system is aware of the context if it uses the context to provide relevant information and services to the user, with the relevance depending on the user's task (Dey, 2001). Feng points to the goal of interaction or to the interaction itself, but in the context of the environment and the user (Feng, 2018). Contextually aware apps can adapt their functions, content and interfaces to their user's current situation with less distractions for the user. More specifically, requests like that can reveal context information such as locations, networks, persons in the vicinity, physical parameters or objects etc.

A specific IoT information system that uses a contextual environment has the potential to provide support to the learning process regardless of time and place. In order to see the possibilities of learning in an environment, authors initially dealt with different options ambient learning² provides. The aim of this was to allow students to learn without interruption, i.e. to learn on the move. Research conducted on the matter and the available results point to some key ambient learning predictors that affect the development of context learning environments such as ubiquitous computing, specific personal students' devices that provide access to information, curriculum content design, learning guidelines, content integration, information on the environment and the place of learning, success evaluation etc. (Feng, 2018).

Just like we analysed the importance of the IoT environment when it comes to developing a smart learning environment at the beginning, we also have to underline the importance of the student model. The student model represents a series of predictors that allow the system to adapt in order to achieve the desired learning outcome in the best possible and most efficient way for every student. This is why the aim of the student model is interaction between the IoT context environment, set learning outcomes, interaction of the student with the system (publicly available information, scientific community, knowledge bases, access to learning objects etc.) and students' interaction with other participants in the learning process (other students, teachers) (Dumančić, 2019; Dumančić, Bakić-Tomić, & Đolo Celizic, 2012)

In order to facilitate the development of the personal student model in such an environment, it is necessary to develop a personal contextual model, too. Building or modelling the personal contextual model with the

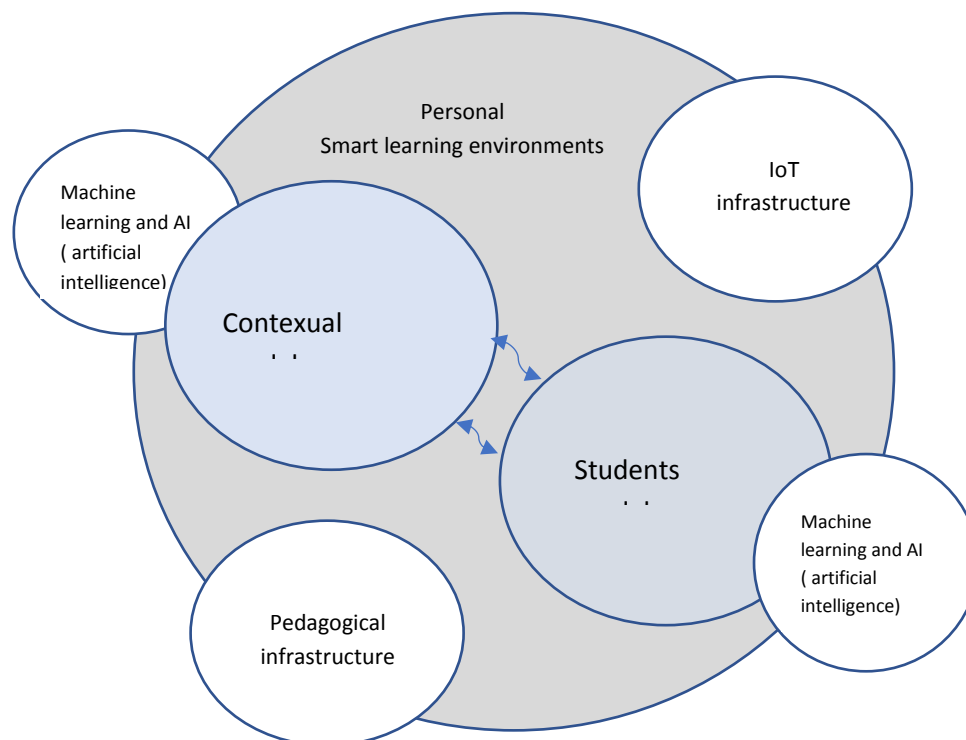

² Project - Ambient, multimodal and context-sensitive lifelong learning, 2006.
(http://www.ambientlearning.net/ambient/download/Files/AMBIENT_LEARNING_FINAL_REPORT.pdf)

application of IoT represents an important infrastructure for collecting different information, which then enables modelling of a personal context. Contextual modelling is necessary to understand a system and its components, and it also supports using and reusing information concerning the context between the apps of the system environment. The product of this interaction is the contextual model. Authors Temdee and Prasad also emphasize the importance of formal representation of the context so that it can be checked for consistency and reasonable judgement (Temdee & Prasad, 2018).

During the last few decades, many contextual models have been developed, from simple ones to complex models aiming for heterogeneity and context mobility. Contextual modelling also has to take into consideration the relationships and dependences of different types of contexts. Building a personal contextual model depends on the goal, i.e. the purpose of the model. The act of preparing information for modelling and the procedure of model creation and testing can be done by using machine learning³ algorithms and methods, as well as by actively using artificial intelligence.

In this paper, we are focused on a personal contextual model which will support smart learning environments. It is a specific contextual model which supports and upgrades the student model, but also depends on it at the same time.

Picture 1. *Personal Smart learning environment*

Every student, in fact, possesses a specific student model created on the basis of various physical, social, communicology-wise, pedagogical, educational and other features. Creating a student model allows every student to master learning objects, communicate with others etc. as efficiently as possible and in the best possible

³ The elements of machine learning include Representation, Evaluation and Optimization. More on that in papers by the other authors.

way. This model is not static – it is dynamic and is being continuously upgraded. The construction of such a model must greatly rely on using elements and procedures of artificial intelligence and machine learning due to the complexity of collecting and processing information about every individual student. The creation of a student model ceaselessly interacts with the personal contextual model, and the two complement each other.

Pedagogical infrastructure encompasses didactic and methodical approaches that promote active learning. Within the smart learning environment, a constructivist approach combined with social constructivism promotes students' active approach to the learning process and mastering the curriculum content, as well as to their societal role. A didactical approach to the constructivist approach interprets learning as an independent process of reality construction, which unfolds in interaction with the environment.

Learning is not mere accepting of knowledge, but a process of a student's integration into a knowledge-based society. It is therefore my belief that the smart learning environment arises as a need and as an option of the current and future knowledge-based society in which students will have an active role.

The proposed smart learning environment is a dynamic model in which all currently recognized elements form an adaptable and active system for every student. It is necessary to emphasize that the interaction between the personal contextual model and the student model and students themselves creates a smart learning environment.

Conclusions and Recommendations

Personal learning environments were created after an extensive study of scientific literature and after analysing the possibilities that new mobile and IoT technologies bring, possibilities that will directly impact the education process. Smart Cities greatly encourage the development of new technologies and everything that they will bring in the future. Education therefore becomes vital for that future; the planning and deliberation about it should encompass different technologies, methods and activities. Every individual matters and it is important to develop their need for lifelong education in the dynamic environment of the future. Despite technology and all the possibilities it brings, we need to examine learning and education as processes aimed at an individual and their needs, but also as something aimed at a community as a whole. Different technologies must fulfil the needs of every individual over the course of their life. This model needs to be re-examined, changed, proven time and time again and adapted to every single student or learner through various research. Within the confines of the model, key predictors of the relationship between the conceptual and the student model should also be examined with the support of new technologies.

In the near future, we will have to examine and define specific differences between smart learning environments and personal smart learning environments, together with the options current and future IoT technologies will provide. This is expressed as a scientific and personal research area of interest.

Abstract

The article is devoted studying the features of state regulation of the labor market. The essence of the labor market has been identified and legal regulation of the labor market and trends of its development are taken into consideration. At the current stage of economic development, it is necessary to improve labor market regulation not only in the republic and regions, but also in economic sectors. To achieve a positive outcome, there is a need for an integrated approach to its improvement, based on a qualitatively new level of the regulatory system. Regulation of the labor market should be based on application of modern technologies and timely adjustments to monitor the market situation. The main concepts and categories that reflect the processes in the employment area of the population are reflected in article in one or another way. In particular, factors and mechanisms affecting level of employment have been studied.

Keywords: economy, labor, market, development, mechanism

Introduction

In modern conditions, the most effective methods of employment and labor market regulation are used. The state regulates investments in various sectors of the economy, controls the retraining of employees, monitoring of employment, implements various programs to reduce unemployment, pays unemployment benefits, organizes public affairs. All measures taken to reduce unemployment or to help the unemployed people require a significant amount of additional costs, therefore, all countries can solve this problem in a timely and comprehensive manner.

Method

The methodological basis of the article is the works of economist scientists in domestic and foreign countries, the laws, programs, regulations and other normative legal acts in this field. In the research process, economic-statistical, monographic, targeted-program systematic approach, analysis and synthesis, summarization, induction, deduction and other methods were used.

Findings

The state regulation mechanism of the labor market can be considered as a sub-system of the economic system regulation as a whole. It's like a "balance mechanism". In regulating labor relations, all activities of the state should be transparent and open. The labor market is regulated by the state (1, p.118):

- Programs aimed at creating works in the public sector;
- Programs enabling the preparation and retraining of the labor force;

- Programs promoting employment;
- Government programs for public unemployment insurance.

The state mechanism for regulating the labor market can be classified as follows. Administrative methods - are essential elements of economic activity. Economic methods affect labor market participants and stimulate them economically. Therefore, it is possible to provide effective employment by correcting the behaviors of the participants. The state directly affects the direction of the labor market. This is done through the following instruments: employment measures financed by the state, tax incentives for businesses that create jobs and etc.

There are also organizational measures used by the state to create socio-economic conditions for all participants in the labor market. The tools used are: labor market forecasting, development of regional development plans, organization of employment services, etc.

The legislation plays an important role in the state regulation of the labor market. State policy is traditionally based on legislation. Because legislation, norms, and rules are required for the efficient functioning of the market. The main place of labor law resources is the Constitution of the Republic of Azerbaijan dated November 12, 1995. This document, which has the highest legal power, is the basis of the legislation, so that, all laws and other acts of state bodies are adopted on its basis and in accordance with it. The Constitution defines the basic principles of the legal regulation of labor. In accordance with these principles, Article 35 (right to work), Article 36 (Right to Holiday), Article 37 (Right to Rest), Article 38 (Right to Social Security), Article 41 (Right to Health) and other articles of the Basic Law form the basic meaning and content of national labor legislation. After the Constitution, the Labor Code of the Republic of Azerbaijan takes a major place in the system of labor legislation. The Labor Code of the Republic of Azerbaijan consists of 13 sections, 48 chapters and 317 articles approved by the Law of the Republic of Azerbaijan dated February 1, 1999, and entered into force on July 1, 1999. The Labor Law of the Republic of Azerbaijan is a legislative law that combines the legal norms regulating labor relations on the territory of the Republic and makes it systematic. The first important works to regulate the labor market in Azerbaijan has been done by the National Leader Heydar Aliyev. Then President Ilham Aliyev continued his policy in this direction. The main purpose of the policy of the socio-economic development pursued by the Azerbaijani President Ilham Aliyev is the development of human capital, the expansion of employment opportunities and the expansion of entrepreneurship activities, the creation of an inclusive labor market and the provision of good jobs in Azerbaijan. Presidential Decree dated October 26, 2005, "Employment Strategy of Azerbaijan (2006-2015)" was successfully implemented. During the implementation of this strategy, the unemployment rate fell from 7.3% to 5% and rate fell poverty from 29.3% to 4.9%, the population's income increased 5.2 times, the minimum wage increased by 3.5 times, the average monthly nominal wage increased by 3.8 times. Complex measures have been taken to identify trends in the labor market, to increase employment and to create favorable conditions for general economic activity, to increase the competitiveness of the workforce and other key areas. Under the relevant decree of President, the Commission on the regulation and coordination of labor relations was established and this Commission approved the Action Plan to prevent non-formal employment in Azerbaijan. Insurance coverage was initiated with the introduction of the unemployment insurance system. It is expected that the new employment strategy will have an important role in the development of public policy and in the transition to intensive development. This document analyzes the current situation and trends in the labor market in detail and reflects the priorities for 2019-2030. Economic development is the promotion of micro, small and medium enterprises, regulatory framework and institutional development, labor market regulation, labor force development and improvement of labor standards (8). Economic development envisages activities on support micro, small and medium enterprises, regulatory framework and institutional development of labor market regulation, development of labor force skills and improvement of labor standards (8).

It is also important to know certain definitions when improving labor market regulation issues. The conjuncture is a temporary situation that explains some of the signs of the current state of the labor market. An important element of the market mechanism is competition. Competition in the labor market allows with a large number of independent employers and workers to compete freely for prestigious work and skilled workers and allows to enter and to leave the market freely. It is important to maintain and support the citizens working on qualified education and restructuring, including the unemployed, state employment assistance agencies dealing with their social problems, personal services of enterprises and organizations, commercial and non-profit workers' exchange in the labor market infrastructure management. There are also some scientific classifications in this field (2, p.8).

The development of the labor market is closely related to regional development. The labor market is an important element in the regional system and ensures the implementation of the targeted regional rehabilitation process. Within the regional system, it cooperates primarily with finance, credit, and material resources, investments, consumer goods, information and knowledge markets. This involves the development of regional employment programs covering the social protection of the population. Regional programs should be based on the concept of labor market regulation, job creation, and maintenance (as a whole, socio-economic and demographic development of the region, production and occupational potential, etc.).

One of the most important issues in the regulation of the labor market is the serious consideration of human capital. The human factor is a complex, multifaceted, and very important concept. None of the areas such as general development of the society, understanding the laws, revealing the nature of secrets, creating complex robotic systems, conquering space, and so on cannot be achieved without human efforts. In modern conditions, intensification of production, an increase of its efficiency, strengthening of saving mode, and acceleration of socio-economic development are considered as the most important problem. Because of the efficient development of the economy, improving the living standards of the people, and the fulfillment of the tasks facing the society, first of all, depends on these factors. These factors include the capacity of natural resources, organization of production, level of production facilities, development of scientific and technical progress and etc. The extent to which these factors are used determines the dynamics of the development of each society. But the human factor triggers all these factors and is universal for all of them. Without human effort, it is impossible to mobilize any of these factors, to regulate them, and to lead the overall development of society (5, p.14).

The increased interest of the economy to human capital is due to the willingness to evaluate the effectiveness of the productive forces of the organization's employees. Human capital reflects the knowledge, skills, and abilities of people who are able to create personal, social and national well-being. This is a key concept for the successful development of any country in the post-industrial era.

Human capital is the most valuable resource. Human capital, factories, equipment, and production resources are the basic principle of competition, economic growth, and efficiency. Human capital in organizations is a major source of substantial and sustainable competitiveness. The main acceleration of the evolution of mutual relations in the market economy is competition. The successful outcome is the presence of an enterprise that can continue to compete internally and internationally. The most important factor in the market economy is the ability to compete, and people determine the types of economic activity (3, p.7). Therefore, proper execution of human capital assessment models directly affects the activities of enterprises. The role and place of a person in the process of social rehabilitation has been of great interest. Researchers have repeatedly sought to identify the characteristics of human capital, evaluated and characterized them qualitatively and quantitatively (4, p.8).

Proper implementation of human capital in the labor market necessitates labor contracts. Proper regulation of labor relations and continuous improvement of the legal and normative base in this area plays a special role in

the development of socio-economic relations. Thus, the proper management of labor relations on a legal basis reduces the social burden of the state and leads to increased productivity in enterprises and organizations. Considering all this, it can be assumed that general development, as well as personal characteristics on the fields, should be considered during labor relations regulation. The regulation of labor relations is directly related to the labor contract. The Labor Contract (The Employment) Agreement) is a written agreement between the employer and the employee. Based on this contract, the employer provides the employees with relevant work related to their employment functions, creates labor conditions in the Labor Code, other normative legal acts, collective agreement, pays their wage, and the employee undertakes to fulfill the contract of employment. Thus, a labor contract is an important document that reflects all aspects of the current business relationship between the employer and the employee. This document reflects the fundamental rights and fundamental responsibilities of the employee, as well as the fundamental rights and obligations of the employer and the responsibilities of the employer. Each employer must sign a written employment contract with at least two copies. Improvement of the employment contract system has special importance in improving labor market regulation mechanisms. In modern conditions of the labor market, the optimal ratio issues of development and demand is of particular importance. Traditionally, factors related to wage level were determined in the study and implementation of labor supply formation processes. Further development of labor market theory provides for the research and disclosure of the content of the proposal (6, p.1). As a rule, the labor market supply implies the number of labor services that can be offered at a certain time on a certain salary market. (7, pp. 114). Trends and volatility trends can be adjusted depending on the qualitative and quantitative indicators of the proposal's topics. For example, the educational characteristics of the labor force may be the basis for adaptation of supply and demand in the labor market. Therefore, the most important methodological problem in labor market theory is to determine the factors affecting the supply potential in local, regional and national labor markets. Traditionally, classical economic theory determines that labor largely depends on the level of payment. [6, p. 114].

The analysis of the situation in our national space related to the labor market improvement mechanism is also important. Azerbaijan's labor market is constantly developing and at the same time facing structural changes. Small and medium-sized enterprises have started to play a very important role in the economy, the workplaces created in this segment are constantly increasing. The growth of small and medium-sized enterprises is also a serious problem in terms of compliance with labor protection and security measures. In this respect, ILO partners provide technical assistance to develop and implement effective strategies that meet new challenges in this area.

Results, Conclusions and Recommendations

Creating an effective system of state regulation of the labor market is one of the major social goals of reform. In the context of modern socio-economic development, the state policy in the labor market should, in order of priority, fulfill the following tasks:

1. The necessity for the ability to work for increasing labor productivity, improving the quality of products and services;
2. renewal of staff potential as a result of the employment of young people receiving modern vocational training;
3. Strengthening the role of professional labor correlation in increasing employee income and relevant changes in labor motivation (highly productive work - high wages);
4. considering the ability to work economically, prophylactic and proactive vocational educating, training and retraining of economically active citizens in order to provide competitiveness;
5. the inclusion of unemployed citizens in public and other temporary workplaces;
6. providing effective interactions to coordinate the ways in which employees, employers, and government agencies can solve employment problems\$

7. the development of an effective mechanism for the expansion of social partnerships in the creation and protection of workplaces, targeted support for creation and protection of workplaces for non-competitive citizens;
8. Implies that, strengthen the integration of the employment policy program at the regional level, which includes the general plan of socio-economic development, focusing on labor market issues at the regional level. The purpose of this policy is to have an exceptional significance for adapting the HR policy of enterprises and organizations (if labor efficiency is one of the key priorities of the public employment policy). The policy aimed at the shaping of a well-functioning labor market is related to the need to eliminate deformations in the labor market and to the inevitable struggle against unemployment which requires a great investment in the maintenance and development of human capital.
9. As a result of the development of new technologies, cities' labor market is open to competition due to limited workplaces and low demands. The rural population has a lot of chances to find workplaces in the city's industry and service sectors. But how should this be adapted to the need for urban labor? Does the city provide a guarantee for adequate workplaces? These questions should be answered systematically.

Abstract

Digital trends in social and economic development change the labour concepts and attitudes towards careers. Through the life course people more often change their job, residence, specialty. That circumstance implies the need for new skills or retraining within the space of lifetime. This study is based on the assessment of the continuity of Azerbaijani education in the digital economy. The work was performed within the framework of the methodology proposed by the World Bank and aimed at interpreting and combining particular outputs of statistical studies, since a comprehensive statistical survey of the digitization of education has not yet been carried out. The results, on the one hand, indicate great promise in terms of system enhancements and expansion of lifelong education opportunities for all categories of citizens through development of the Azerbaijani digital space and increase the number of training organizations. On the other hand, the development of this direction is weak and of an ad hoc nature: specific goals and objectives, supply and demand, formal and informal methods in each field of Azerbaijani education are not fully taken into account.

Key words: Digital Economy, Information Technologies, Continuing Education, Ongoing Build-up of Digital Literacy

Introduction

Throughout the entire existence of mankind, society in its development went through three stages: agrarian stage with a predominance of agriculture and manual labor, industrial stage with industry dominance and post-industrial or digital stage, which is characterized by the dominance of services in the economy and the emergence of information technologies.

The digital economy, namely the emergence of new opportunities certainly has a positive effect on a person's life.

In this study, one of the tasks under consideration is identifying a number of problems in the digital economy from the perspective of lifelong education in order to maintain a coherent system of rational management. Those objectives include an analysis of the minuses that emerged with the introduction of the "digits" in the life of mankind. Among them we call rising unemployment in the labor market, since the risk of disappearance of some professions and even industries increase: for example, many experts seriously believe that the banking system will disappear over the next ten years (Charungkaittikul, 2018). This will be possible due to the further spread of information technology and its products, such as: shops with electronic cash registers, bots serving customers,

self-driving cars and other things. It is also necessary to note the “digital divide” – the gap in digital education, in terms of access to digital services and products, and, as a result, the gap in the level of well-being of people. So lifelong education is crucial, but at the same time, is the weakest link in the developed national educational systems.

As hypotheses of research on the successful creation and improvement of the system of lifelong education in the digital economy, the authors state the following assumptions:

- In its content, form and functional derivatives, the external and internal continuity in the system “secondary school – higher school – work – pension” should contain digital conditions for the formation of students’ activities and model the internal logic of its development;
- The development of research activities of students should be an integrated and prolonged educational process, accompanied by the formation of the subjective position of the future specialist;
- The educational space “secondary school-higher school-work-pension” should be represented in a single integrative educational system, including organizational-functional, logical-informative and personal subsystems.
- the backbone of lifelong education should be a university complex, which provides the structural and substantive integration of scientific, educational and other institutions.

Research methods

The aim of the research is seeking new approaches to boosting the growth of the educational (general and professional) potential of an individual throughout life in the framework of using the system of state and public institutions and in accordance with the needs of the individual and society, as well as ways of using modern digital and educational technologies to meet the needs in the digital age.

The objective of the presented research is to assess the continuity of education in Azerbaijan in the conditions of a developing digital economy based on modern methods and results of theoretical and statistical researches.

The work is performed within the framework of the methodology proposed by the World Bank, which includes an assessment of five groups of indicators: the continuity of the use of information technology in the educational process; training of teachers for the use of information technology in education; informatization of education management; higher education information infrastructure; regulatory support of digitalization of education. The factual basis of the study is data from official statistics and universities (Fantom & Serajuddin, 2016).

The solution of a wide range of tasks in the process of forming high-quality lifelong education under universal digitalization should be based on the principle of connectedness. Thus, **analysis techniques** of this research allow combining the entire educational structure into a common, usable cascade digital circuit with the necessary degree of aggregation and detailing.

The role of universities in the transformation of education in the digital economy: from knowledge to skills

The digital economy is fundamentally changing the labor market: where a computer can replace a person, it will replace it. Self-employment is a way out for people who have lost their jobs, especially since digital technologies provide new opportunities for organizing and developing business. Thus, the concept of lifelong education received an impulse for development a little more than 30 years ago and the last decade has been actively developing. The task of expanding access to continuing education is driven by the need to create a competitive and knowledge-based economy environment. Lifelong learning, among other things, contributes to the personal self-fulfillment and labor adaptation of the adult population, improves the quality of the human capital.

Furthermore, in the near future, a regular change of profession will become the norm, although even being in the same professional field will require receptiveness to education more and more. The concept of continuing

education assumes that a person's life is not strictly divided into a period of study (before graduation) and work, and learning is an ongoing process throughout life.

Universities should seek ways for maintaining their competitiveness by best preparing students for the real world. Yesterday, in the industrial economy, the effective solution of this task was a list of the curriculum that universities taught their students. However, today, in the conditions of a digitized economy, such training, based on fundamental knowledge, is no longer enough. Therefore, the best universities can give their students today is to teach them continuously learn, to interest them in the lifelong process of education and self-education.

Today, students' willingness for life in the real world is determined by their readiness for a continuous process of education, throughout their careers; their preparedness for the continuous process of self-reequipping. Otherwise, without giving priority to education and self-education, a person becomes obsolete as quickly as high technology.

Therefore, in a rapidly changing digitized world, only those organizations that care about involving their staff in a continuous education process are competitive. Thus, these organizations maintain up to date their ability to "take a digital wave", to adapt to market changes flexibly and quickly.

In order lifelong education to become the life norm, the structure of online education must evolve and the attitude of society towards learning should change. In addition, if the first task is directly related to the development of online platforms, software, content digitization, the second task is the development of a person's inner motivation to learn. As Kovalchuck 's research has shown, the main reason why adults do not go to learn new things is the lack of an internal need for it (Kovalchuck & Vorotnykova, 2017).

On the one hand, researches in Azerbaijan indicate a high level of provision of universities with personal computers and Internet access, and on the other hand, they demonstrate a lack of automation of administrative and educational processes of the university (Rzayev & Suleymanov, 2018). Despite the continuous development of technologies and the emergence of new educational web services, as well as a long-term government policy on the formation of the information educational space, its potential is partially used by universities. Only a third of university students are trained using e-learning or distance learning technologies (Shirzadova, 2016). At the same time, non-state educational institutions provide most of the online educational services available to students (Shirzadova, 2016). In general, the share of online education in the market of educational services in Azerbaijan is small and amounts to 1.8% for higher education programs and 6.7% for additional professional education. 82% of students enrolled in programs with the exclusive use of e-learning are students of private universities (Shirzadova, 2016). The use of technology even in the blended learning format in addition to the IT infrastructure requires appropriate training of teachers and students.

However, a further impediment for participation in lifelong education is a lack of time (workload or family responsibilities). According to the authors, the realization of an individual approach to the organization of training and creation of a more flexible schedule for the possibility of combining work and study can stimulate the adult population to become more actively involved in learning and education.

But, basic or fundamental skills are highlighted in almost all studies, which, as a rule, are laid in the early stages of educational processes. The development of basic skills serves as the foundation for the development of the required skills for lifelong learning. Generally, knowledge have always been the end product of education, but in the digital economy the demand for skills has acquired a systematic, massive and at the same time specific nature.

Skills have a direct connection with the work position and workplace. Otherwise they do not make sense. In view of the high dynamics of the processes of the digital economy, today the skills are characterized by the dynamics of their lifetime, tied to the life cycle of the workplace, and this distinguishes them from the "petrified"

competencies. Therefore, the formation of specific skills should be carried out, firstly, as soon as possible while they are still relevant, and, secondly, given the fact that they can adapt to new conditions and develop.

Further, another factor that we call polydisciplinary of experience is that the content of skills can cover several different convergent subject areas, which naturally makes it difficult to learn these skills. For the development of such skills, the university environment seems to be very suitable, which is very fruitful for interdisciplinary research and development.

The next factor is the rapid development of the workplace ecosystem, the increase in the volume of scientific and technical information associated with the labor functions, the emergence of fundamentally new ways of working (Evans & Haffenden, 1988). All this requires constant updating of complementary skills.

It is also necessary to mention the factors of mobility and competitiveness of skills, which, as a rule, will be combined in a virtual space to solve common problems, bypassing administrative and international boundaries. Finally, authors note the factor of the increasing role of international standards, the comprehensive system of which is being formed by the world community (Kupriyanovskiy et al, 2017).

In the framework of basic skills, the entire spectrum of digital experience that make up digital literacy is shaped. Digital literacy is the ability to create and use content lading with digital technologies, including computer programming skills, searching and sharing information, and communicating with other people. There are different criteria for the development of digital literacy. For example, Henry Jenkins believes that digital literacy includes the ability to work with a hardware (human interaction with a digital technology), an understanding the features of the device and the ways of dissemination of digital information (that is, the ability to work with software), an awareness of network community and social media features (Jenkins, 2006).

Doug Belshaw singles out eight elements of digital literacy, including an understanding of the cultural context of the Internet environment, the ability of communicating in online communities, the ability of creating and distributing content, skills for using digital technologies for self-development (Belshaw, 2012).

Authors of various digital literacy concepts agree on one thing: only understanding how digital reality works can teach a person to control “information noise” and make interaction with digital technologies into a source of development, but not stress.

Lifelong professional education in the context of the digital economy of Azerbaijan

The observed growth in demand for digital literacy once again emphasizes the profound transformation of society from the industrial structure of society to a society based on knowledge, and in the result the knowledge becomes the main asset and must be continuously regenerated through training and production. Employees in the digital economy should be able to create and process complex information; think systematically and critically; make decisions on a multi-criteria basis; understand the essence of the ongoing processes of a multidisciplinary nature; be adaptive and flexible to new information; be creative; be able to identify and solve real problems of the digital world. But the digitalization of the education system cannot be limited by creating a digital copy of familiar textbooks, digitizing documents and providing all schools with access to high-speed Internet.

“The National Strategy for the Development of the Information Society in Azerbaijan for 2014-2020” (<http://www.mincom.gov.az/upload/files/7127fa87906a4d9af22415aaac9b16ae.PDF>) along with the existing concepts of “information society”, “knowledge society” introduces the concepts of “digital economy”, “ecosystem of digital economy”. Inevitably, new terms appear in education, for example, digital education and lifelong education. A disseminated interpretation of lifelong education is the process of learning the necessary competitive competencies, preparing human capital for the digital economy. Analogy with generally accepted

categories such as “technical education”, “economic education”, “medical education”, etc. is hampered, as there is no clear selection of the subject area for lifelong learning.

Later authors consider the basic direction that affects personnel and lifelong education in the context of development of digital economy of Azerbaijan. The field of education has always been and remains a key element in the global competition of states for economic power and political influence. The “State Strategy for the Development of Education in the Republic of Azerbaijan” (<https://edu.gov.az/ru/page/69>) defined goals and objectives, the solution of which is a necessary condition for Azerbaijan to remain a full-fledged, independent and respected member of the world community.

Along with the above, there is a need to implement new steps to ensure that the education system in the rapidly modernizing Azerbaijan Republic meets the challenges of human capital development, bringing the quality indicators of general education in line with European standards. To improve the quality of education, the restructuring of the education management system and the development of human resources in this area are necessary.

In the conditions of the digital economy formation, the authors propose the following directions for the improvement of personnel in education:

1. The scheme of certification of personnel competencies in terms of continuity of education should be variable and consistent with professional educational standards, the national qualifications system.
2. The system of basic educational programs should ensure digital literacy of the population, training for the digital economy and use its tools and environments.
3. A lifelong education strategy, retraining, advanced training and involvement in the digital economy of public servants over 50 years of age should be implemented.

Suggestions

To achieve these goals, it is necessary to create a system of descriptions of continuous competencies of the digital economy, integrated into the national system of qualifications, interrelated with professional and educational standards. This includes the mandatory creation of a regulatory framework or the “Digital Labor Code” and infrastructure for continuous, flexible, distance employment.

Next comes the problem of personal digital recording of the continuous development of citizens, including the recording of labor and educational processes. To this end, it is necessary to develop and introduce alternative certification systems of “adult education” that are adequate to the tasks of the digital economy. The introduction of the system of lifelong education includes the improvement of additional education.

The goal of lifelong education is not only to teach a person all his life, but also a motivation of teaching himself. Many scientists believe that the formation of stimulating environment should begin as early as elementary school, taking into account the physiological and mental characteristics of a child’s age (Boonloy, 2018). Future changes cannot but influence the educational sector at the initial level, therefore one of the directions should be personnel and program changes in general educational organizations for children.

Discussion

Continuing education is a holistic process consisting of sequential stages of specially organized educational activities that create favorable living conditions. Nevertheless, at present, lifelong education in Azerbaijan is still not treated as a unified system of state and public educational institutions, which ensure organizational, meaningful cohesion and consistency of all levels of education.

Life has its own requirements - developing the ability of a person to quickly respond to all changes, take initiative, expanding communication skills, etc. According to statistics from Azerbaijan, only 97% of university students are under the age of 25 (Silova, Johnson, & Heyneman, 2007). The rest of the population is adults, burdened with family and business concerns, who have either completed their formal training or those who were unable to complete their education. The system of continuous education in Azerbaijan does not meet the requirements of modern life, especially if we consider not only transport costs, but also the costs of organizing the entire system of full-time study. We have been able to observe the growing interest in full-time education with elements of distance education technologies, or, in general, the learning in full distance format. The use of technology even in the blended learning format in addition to the IT infrastructure requires appropriate training of teachers and students. The training of teachers for the use of IT in education, including teaching directly to work with IT themselves, should be complemented by training in methodical work in the information educational space (Shabanov & Quliyev, 2016).

Despite the positive changes in providing the country's educational institutions with computer equipment, in general, the level of information infrastructure of the education system is far from being perfect. Over the past 3 years in general education schools, 12232 teachers have completed special preparatory courses on ICT, which are only 7% of the teaching staff. Over the past 5 years, out of 12,367 people of the teaching staff of higher educational institutions, 391 people (3.2%) completed special training courses in ICT, the indicator for the specialized secondary schools was 90 (1.3%).

Conclusion

Summing up the research, we can say that in terms of automation of various production processes, which led to the complete or partial disappearance of a number of specialties, as well as a massive shortage of specialists with digital knowledge, skills, and abilities, Azerbaijani educational infrastructure should be adapted to new requirements. In the education system, it is necessary to develop and introduce fundamentally new approaches to learning, which will ensure a high level of basic digital literacy of the population. To solve such ambitious tasks, first of all, personnel who possess distinctive social and professional characteristics are necessary. In the information age, the teachers of educational institutions must adapt to the possibilities and limitations of the digital economy, use its benefits on a daily basis and feel comfortable when faced with the digital shock of the future, learning continuously throughout life. On the other hand, the teacher must act as a citizen who interacts responsibly with digital government, digital media, and as an employee with the necessary competencies for effective and continuous activity in the digital economy (including the field of culture and research), using activities in the digital environment and digital tools as a learner and professional.

Email: arzu_huseynova@unec.edu.az

Abstract

The article deals with the application of electronic management systems in the higher education system, the increase of electronic resources, the ways to ensure employment and convenience for teachers and students, the implementation of social reading programs apart from traditional lectures in the training classes, provision of information security, and elimination of electronic backwardness. The article also discusses the use analysis of electronic information system in Azerbaijani higher education institutions and evaluation methods of its economic effectiveness. Created a questionnaire to analyze e-learning, traditional training, and mixed learning. The questionnaire covers 20 electronic resources. The level of use of electronic means in the training process was analyzed based on the survey questionnaire. Survey questionnaire was conducted between teachers and students of higher education institutions.

Cluster, regression, SWOT, and PEST analysis methods were used in the process of query processing. As a result, it was recommended to develop a strategy for the electronic education system and to develop a human resources training system for innovative Technologies.

Key words: LMS, SWOT, PEST, cluster, electronic resources.

Introduction

Establishment of Information Society in Azerbaijan is one of the main priorities of the state policy. The main tasks of the formation of information society are the creation of legal bases of information and knowledge society, the development of human factor, the right of citizens to receive, disseminate and use information, the formation of electronic government, electronic commerce, strengthening of economic, social and intellectual potential of the country, establishment of information and knowledge-based, competitive economy, creation of modern information and communication infrastructure, formation of uniform national electronic information space, implementation of electronic governance systems in higher education system, increase of electronic resources, determining the ways to ensure employment and convenience for teachers and students, implementation of social reading programs apart from traditional lectures in the training classes, provision of information security, and elimination of electronic backwardness.

The tendency of global informatization of the society is directly related to the development of educational institutions. This requires the creation of a continuing education system that ensures that everyone has access to quality basic education, as well as to the wishes and demands of everyone at any time and place, from the point of view of the availability of education. It is important to use electronic education (e-education) technologies to build such education system. E-education technologies are the most effective tool for managing new types of education and developing the necessary knowledge and skills in the future for lifelong education. E-education creates a bridge between labor activity and education and creates extensive opportunities for lifelong education.

Metod

In recent years, the ways in which people have interacted with each other has undoubtedly changed. The use of

public network utilities, such as face-to-face dialogue and telephone conversations, continues to increase. Facebook and Twitter. Nothing is different from this phenomenon. It should be noted that students are not separated from smart phones that can update their status.

Note that today there are considerable improvements in internet resources development in Azerbaijan. The main reason for this is the increased interest of the pedagogical staff in the medium and higher education of using the internet as the educational tool. Today, higher education institutions are provided with computer and internet in Azerbaijan. The results of the analyzes show that they are used effectively in the education process. Today's teachers are interested in the development of electronic resources in electronic governance systems. The Azerbaijani state is not indifferent to these issues.

1. Current situation

The State Strategy for the Development of Education in the Republic of Azerbaijan was approved by the Decree 13 of October 24, 2013. The decree states: "In modern times the role of education in economic life has significantly increased. At the moment, education should be accompanied by the introduction of the required knowledge and skills in the economy, as well as the comprehensive training of the person to future life and integration into the society¹. The most important of all is the factor that raises the role of education in economic life. At the same time, rapid technological advancement requires regular updates of knowledge and skills. This increases the demand for new smart educational technologies and more appropriate qualifications and competitiveness. Based on knowledge, the education system occupies a special place in the development of the economy".

The society of information and knowledge creates enormous opportunities for publicizing the individual knowledge with the help of the Internet. At present, a number of reforms are being carried out in Azerbaijan in the direction of formation of information and knowledge society. Adopted by the Decree of the President of the Republic of Azerbaijan dated December 29, 2012², "Azerbaijan 2020: Outlook for the Future" Development Concept and "Strategic Roadmap for the National Economy Perspective of the Republic of Azerbaijan" approved by Decree of the President of the Republic of Azerbaijan dated December 6, 2016 has been accepted. These state programs also give impulse to the development of other knowledge-based economics infrastructure - high quality education, effective fundamental science, knowledge production and high technologies, effective science-technical business venture, and implementation of ideas and transfer. The important role of e-education in the development of national education systems has been reflected in relevant documents confirmed in our country. Thus, the Law of Republic of Azerbaijan on education "833-IIIQ of June 19, 2009" was approved³.

2. Analysis of electronic education system in Azerbaijan and methods of their economic efficiency evaluation

The core of the modern electronic education system is the **LMS (Learning Management System)** or the training process management system. **LMS** is designed for a large number of students and focuses on cooperative training in educational institutions. The main feature is the ability of the trainee to pass a certain part of the course, the date of entry into the course, the number of visits, and to control the process of passing the course. This system allows the user to sign up for listening the course. Sends the registered user a reminder of the next online course. The trainee can check his or her own values. Also, has the ability to chat, participate in different social groups.

¹ "State strategy under development of education in Azerbaijan Republic" by Order No.13 dated 24.10.2013. Baku, Azerbaijan. 2013, <https://edu.gov.az/en/page/473>

² Development Concept "Azerbaijan 2020: The View to the Future", 29 December 2012

³ National Strategy for the Development of Information Society in the Republic of Azerbaijan for 2014-2020 https://president.az/files/future_en.pdf

Here are some examples of electronic education systems currently available around the world:

1. **e LEARNING 3000** - (eLearning Server 4G + RLS + TinCan API for the mobile training). The program uses more universities. Integrated: BD, Active Directories, Navision, 1C, Lotus, SAP
<http://hypermethod.ru/>
2. **Web TUTOR** - (supports the international standarts such as SCORM 1.2, SCORM 2004, AICC, TinCan). Working with IE və Mozilla FireFox browsers.
http://websoft.ru/db/wb/root_id/webtutor_sdo/doc.html
3. **MOODLE** 2.6 - (GNU General Public License) shared by license. Integrated: Joomla. 30% of higher education institutions in US, and Czech, Slovak, Hungarian and Thai schools are using it.

It is known that the implementation of advanced technologies in the education system serves to innovative development. The implementation of the LMS system and the Moodle, which has been used to improve the quality of education and dynamic development in our country, has become widespread. Attention is paid to the existing problems and ways to resolve them, discussion of the advantages and perspectives of development, and study the international experience. It is noted that in the modern world, the application of advanced technologies in any field of activity, including education, has a great importance in terms of improving quality in this area, achieving positive quality indicators and dynamic development. It is also noted, that MOODLE LMS is more widely used in the world in comparison with the Blackboard and Sakai LMSs.

At present, the LMS system is implemented in our country. In the UNEC (ASUE), Prometheus has been prepared for 20 observation surveys in the 2015 academic year with 30 teachers and students and 30 secondary education providers in the electronic education system.

As a result, **SWOT** analysis method was used in the processing of surveys, 2 (two) tables were developed on the general state of teachers and students' use of electronic education system.

Table 1. Analysis of teachers' use of electronic education system

Online-simulation	
Use of e-databases on materials posted online	

Socialnet

As we see from the analysis, students are more interested in using electronic education system than teachers. On the other hand, although many countries around the world are using electronic education system and using the LMS system, the issue of the importance of establishing this system in our country is reflected only in government programs. Establishing the LMS system will result in more benefits for students.

Let's look at the regression model to calculate the effects of survey results on each other. For this purpose we will process the request data after the survey has been completed.

Table 3 Assessment of survey results

N	e-resources	High school teachers	Middle school teachers	Students	Pupils
1.	Youtube	14	19	11	17
2.	Video-lesson	12	21	10	4

18.	Offline	2	9	6	4
19.	e-mail	25	26	16	28
20.	Chat	29	27	18	30

To ensure the convenience of the processing, let's codify the result parameters in the survey questionnaire and determine the coded informatics indicators. Codify data in survey form as e-resource and divide them into clusters:

Table 4. Grouping of e-resources according to usage level

N	e-resources	Result indicator		Factor indexes	
		High teacher	Middle teacher	Student	Pupil
Cluster 1 (usage level of network technology)					
1.	Chat (mob.)	29	27	18	30
2.	Sos.net	24	21	19	8
3.	Forum	4	6	2	2
4.	Webinar	9	3	2	6
5.	e-mail	25	26	16	28
6.	Youtube	14	19	11	17
Cluster 2 (usage level of e-training materials)					
7.	Video-lesson	12	21	10	4
8.	e-book	30	28	15	24
9.	Online simulation	8	7	4	8
10.	e-material	11	14	5	6

11. e-lecture	9	18	6	6
12. Wikipediya	10	12	8	13
13. e-base	10	7	2	10
14. e-library	11	8	3	9
15. Search	5	12	7	17
Cluster 3 (priority level of e-education)				
16. Traditional	24	23	23	10
17. Hybrid	12	25	12	10
18. Real time mode	10	13	3	14
19. Online	5	8	3	8
20. Offline	2	9	6	4
Average result	13,2	15,35	8,75	11,7

The table summarizes the result indicator and the factor indexes of the e-resources divided into cluster groups. As you can see, the result indicator of the electronic resources listed in Cluster 1 and the factor indexes are high. Because 99% of the population of Azerbaijan is a mobile phone user. There is a disparity between the value of the result indicator and the value of the factor index on electronic resources found in Cluster 2. Thus, the high teacher's parameters value is lower than the factor index value. In the field of education, there is a great need for creative staff, who work with innovations.

Innovation potential in Azerbaijan is weak. Finally, Cluster 3 usage levels of parameters value are quite low. Because, the azerbaijani-language electronic resources are quite low. No methodological resources have been developed for the use of electronic resources in Azerbaijan. Generally, there is no normative legal document in this field.

Thus, the high teacher's index is calculated based on 20 indicators of 3 factor indexes. Here, e-resources differ from each other by the value of factor groups. For example the average values showing the level of use of e-resources on factor groups were calculated and diagram based on it was calculated.

Figure 1. Comparison of factor index.

Regression models are set up on the interaction between the middle teacher, student and pupil factors and the high teacher factor of indicators included in the group of factor indexes. As a result, all units became equal. Let's take a look at the impact of the survey results on each other.

The obtained equality of values and statistics are given in Table 5. The linear regression model is designed for the

following indicators:

Figure 2. Regression model indicators

Interaction between the high teacher's factor and the other 3 (three) factors – the middle teacher, student, and pupil is determined by the index of the use of 20 electronic resources.

Table 5. Linear regression equations for the group of factors

Factor group	Linear regression equation	Determination coefficient	Darbin-Outson coefficient
Teacher schol	$Y_i = 5,1851 + 0,7701 X_i$ Middle teacher	$R^2 = 0,6683$	DW=2,11
Student	$Y_i = 3.0584 + 0.6547 X_i$ Student	$R^2=0,4913$	DW=1,58
Pupil	$Y_i = 0,1786 + 0,6494 X_i$ Pupil	$R^2 = 0,7199$	DW=1,89

It should be noted that the determinant coefficient depends entirely on the indications of result index value of the high teacher. The determinant coefficient of middle teacher factor indicates that 67% of high teacher depend on a middle teacher. Darbin-Watson's coefficient is smaller than 2, meaning that autocorrecting is adequate for indicators of equality. The determinant coefficients in the high teacher's coefficient, middle teacher, student, and student-dependency models show that the high teacher's result indicator depend on the indicators included in the model: at least 49% of the student factor and 71% of the pupil factor⁴.

The problem of reducing the usage level of electronic resources by teachers has been identified as a result of the regression model based on the questionnaire survey. To analyze the cause of the problem, we need to use the macro environment analysis, in other words PEST analysis. PEST is a political, economic, social and technological environment. Macro-environment is political, legal, economic, demographic, social, cultural, technological and environmental changes in our society's life . We will look at the economic and political environment together because the interaction between them makes it difficult to identify individual effects that are often taken separately. Political change in one sphere creates economic change in other spheres, and changes in the economy can accelerate political activities and changes in general.

Table 6 . PEST analysis

POLITICAL Factor	Impact on institutions	PEST educational Planned event	analysis
State does not provide teachers with free internet	The teacher can not work on it		Teachers will be given a workshop on e-mail usage
ECONOMICAL IT department is closing Low funding from public sector	Budget reduction		Control over budget spending reduction Requirement for quality improvement, skilled workers search
	Demand for employers in multi-profile courses		Testing of teachers

⁴ Model evaluation of an Innovative Capital, OCT 12-14, 2016, 607-609. Web of Science
<https://ieeexplore.ieee.org/document/7991775>

IT + health		
SOCIAL		
Rise of salary	Preparation for distance lessons Preparing graduates for a global career	Appropriate salary Work experience on Lonardoo / Erasmus schemes
TECHNOLOGICAL		
Webcam, networking, social networking and online students	Web demand for web-teacers in online social student groups	An electronic warehouse that stores educational facilities, Open Source Web 2.0 new website for students and teachers to use interactivity

In Table 6, we need to look at all the factors in the PEST analysis and to analyze the impact on their higher education institutions by choosing the important ones, and in the end, the most positive and most negative factor that will affect the university's overall macro environment. PEST analysis was based on questionnaire survey. Strategic conditions created by external environment affecting the low level of use of e-resources by teachers in higher education institutions were assessed.

Conclusions

The possibilities for e-learning in Azerbaijan are quite complicated. Development of methodology and normative base is at a low level. The uncertainty of the criteria for the quality of electronic courses, complicates the implementation of electron education.

In the course of the study, the current situation has been analyzed and suggestions have been made to address the problem⁵.

The efficiency of training on the basis of information resources depends on the quality and quantity of resources and information technologies used by teachers and students. Furthermore, the economic effect of electronic courses depends on the number of students.

Electronic training is offered by the government to provide e-standards for new generation technologies, support broadband effective and other emerging technology systems, accelerate technical work required for the national e-portfolio development, and elaborate electronic education methodological plans. In addition, it is recommended that a strategy for the electron training system be developed to expand the national electron education network and create a system of personnel training on innovative technologies.

Abstract

Our aim is to analyze sustainability on energy governance, recent trends of the electricity sector in Azerbaijan. In particular, the degree of efficiency of the electricity system and the tariff structure to give recommendations for future development and perspectives of liberalization. We argue that government policy should be oriented towards identification of those factors that seek energy efficiency for sustainable development, uncover several laws, ensuring energy security and encourage electricity market. Besides that, by comparing electricity tariffs in Azerbaijan with some other European countries we find advantages in the Azerbaijan-EU partnership on the energy field, thus we propose appropriate forms of cooperation regarding to European Neighborhood Policy.

Key words: sustainable development, energy, Azerbaijan, regulatory authority, electricity sector, transmission, distribution, tariffs, generation.

Introduction

The main objective of the Azerbaijani Government in the energy sector has been to become self-sufficient in terms of meeting the energy demand. This objective has been achieved for oil since 1998 and for gas and electricity since 2007. Moreover, in addition to traditional fossil fuels exports, there is also currently potential of renewable energy deployment especially of wind power and solar photovoltaic energy. According to Action Plan 2011–2015, approved for the implementation of the State Program on Poverty Reduction and Sustainable Development (2008–2015), (2015–2030) the country begin liberalization of enterprises in the fuel and energy sector. Liberalization of some projects in energy fields could bring a synchronized development of small and medium-sized enterprises (SME). Especially the electricity sector which ensures the energy security of the country becomes more important for improvement. Substantial measures were taken for the formation of legislative basis in the power engineering sector, and improvement of legal basis concerning this field. Several laws were passed on power engineering, including the law on “Power Engineering”, “The Use of Energy Resources”, “Electrical Power Engineering” and “Electric and Thermal stations”. Azerbaijan become a regional leader in managing the energy system and raise its export and transit potential in this field. A short-term target should be to prevent wasting natural resources and to develop an alternative, renewable energy for internal needs.³ Baku city and its provisions mostly located on the coast could be supplied with wind and solar photovoltaic energy set using innovative solar heating system in all residential buildings and industrial constructions.

Method

The method of the research is based on a technical-legal analysis of the statistical data on energy sector in Azerbaijan, which is drawn up by the Azerbaijan Ministry of Energy and other regulatory Authorities such as tariff council. Other

¹ Especially in Absheron peninsula (coast of Caspian Sea where is located capital city Baku) where annual sunny and windy days prevail.

strategy to give a comparative analysis in power generation capacity and production, the electricity consumption and dynamics of export and import in Azerbaijan.

1. Institutional structure and legislation

A significant feature is that today Azerbaijan does not depend on foreign resources in the energy sector. Thus, it is a privileged starting point for sustainable development. It provides 100% of its gross energy consumption through domestic production, which is currently largely reliant on the exploitation of the country's hydrocarbon reserves. On the other hand, Azerbaijan cannot depend solely on its energy sector. It must promote sectors as well to build a robust economy for the future. Over the last years, Azerbaijan has successfully identified political development and administrative reform as national priorities in order to increase economic growth, alleviate poverty and decrease unemployment. Azerbaijan has significantly improved its performance and competitiveness in the economy. It is currently the best result among the CIS countries; ranking 39th among 140 countries⁴. The European Union (EU) has endorsed these national development plans of the Government of Azerbaijan and is currently supporting their implementation through the European Neighborhood Policy.

The Ministry of Energy (MIE) is the central executive authority implementing state policy and regulation for the energy sector. Regulatory policy is implemented primarily by the MIE, and also by the Ministry of Economy and Industry and the Tariff Council. The MIE is largely responsible for implementing the various regulations, orders and decrees issued by the government. The MIE has a board, approved by the Cabinet of Ministers, and has authority to issue orders and decrees within its area of competence. Such competence extends to most areas within the energy sector, but not to tariff regulation, which is within the area of competence of the energy regulator, the Tariff Council.

The Tariff Council acts pursuant to authority granted to it by Presidential Decree (26 December 2005), the Regulations on the Tariff (Pricing) Council, and the Resolution by the Cabinet of Ministers (9 March 2006). The Tariff Council establishes the tariff methodology, approves the tariff level proposed by regulated companies (including but not limited to energy), proposes changes to the legal framework as it relates to pricing; and settles disputes regarding price regulation and tariff application. It may act upon its own initiative within its tariff jurisdiction. The Tariff Council has a Chairman and 12 additional Council members who serve in a Council not a staff capacity. The Chairperson is the Minister of Economic Development and the 12 Council members are Deputy Ministers (10 members) and deputy heads of Committees (2 members). In the event that the President, pursuant to a decree, replaces the Minister and deputy heads of ministries and committees, that decree automatically replaces the Council Chairperson and Council members. There are no fixed terms, with the Chairman and members serving for the duration of their appointment by the President.

The main legislative acts regulating the power sector are the Energy Resources Law, dated 30 March 1996, the Law on Electrical Energy (the Electricity Law), dated 13 June 1998, and the Law on Electricity and Heat Power Stations (the Power Station Law), dated 28 December 1999. To satisfy the public's need for electricity and gas, the government adopted the State Program on the Development of Fuel-Energetic Complex of Azerbaijan (2005-2015)⁵. To address the growing global concerns over air-polluting emissions, in 2004, the president approved the "State Program on the Use of Alternative and Renewable Energy Sources in Azerbaijan Republic". Till the 2020 it's expected to increase alternative and nuclear energy percentage of total energy use in Azerbaijan.

According to the Electricity Law, the energy system of the Azerbaijan Republic should make provision for the following. The State Electrical Enterprise operates transmission lines of more than 110 kV, dispatching centers and

⁴ Elshan Ahmadov (2013) Azerbaijan in the context of competitiveness, sustainable development and green economy. Materials of the Baku International Humanitarian Forum, p.259.

⁵ State program on development of fuel-energy sector in Azerbaijan Republic (in 2005-2015 years) (in Azerbaijan language, zip. 1227 kB) http://www.azenerji.com/az/powersystem/law/Dovlet_enerji_proqrami.pdf

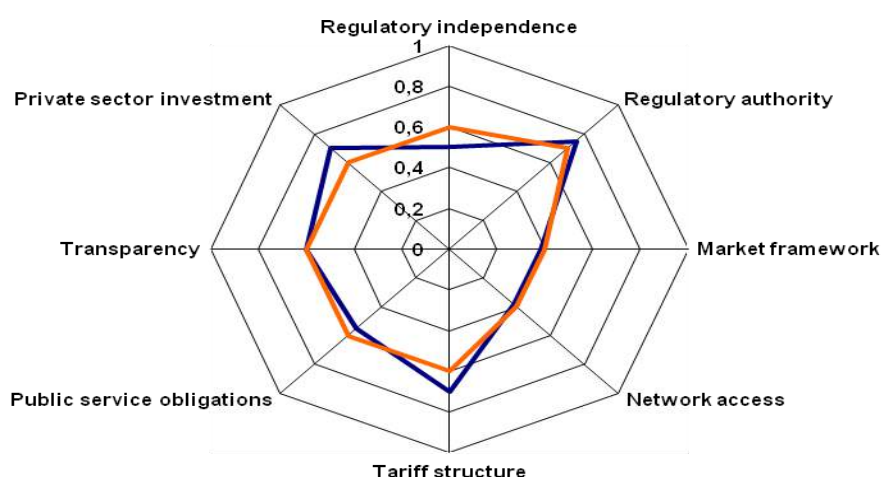

energy production enterprises; second, The State Electrical Enterprise purchases energy produced by independent energy producers for its transportation through the transmission network, and conducts interstate energy exchanges; third Energy suppliers, which purchase electricity from the State Electrical Enterprise or other independent energy producers and sell it to consumers; and finally independent energy producers, which are economically and organizationally independent legal entities and are not part of the common state electrical energy system. These producers generate energy and supply it to consumers directly through their own distribution networks or via the State Electrical Enterprise or energy suppliers. These entities may also export their power.

The main objectives of state regulation of tariffs for electricity are ensuring energy security of the country; maintain a reliable power supply to consumers, set tariffs at a level that ensures the interests of consumers and producers of electricity, to favor investment in power generation facilities and develop interconnections. Moreover, to ensure direct state regulation of prices (tariffs), pricing authorized by the Government of a public authority and establishing methods for calculating tariffs to order their approval and to which all regulatory authorities and businesses. In this way reduction of prices, tariffs and losses, establishing free market and private power plants. Improving the quality of service and improving competitive conditions. Besides that, adapting to Europe standards, harmonization of legislative framework to the Directive and the Regulation of the European Parliament legislative framework and project implementation on transmission and distribution are the tasks set to the government. Besides these regulatory factors, there are many organizational and behavioral factors that influence the choices of project developers⁶. In Section 4 we discuss in more detail the tariff system.

Figure 1 presents the electricity sector results of Azerbaijan, in accordance with the benchmarks and indicators identified in the assessment model. The extremity of each axis represents an optimum score of 1.0, that is, full compliance with international best practices. The fuller the “web”, the closer the overall electricity regulatory framework approximates international best practices. The results for Azerbaijan are represented by blue line.

Figure 1. Electricity spider graph of Azerbaijan⁷

⁶ Sonja Luthi, Thomas Prassler (2011) Analyzing policy support instruments and regulatory risk factors for wind energy deployment - A developers' perspective, Energy Policy 39 pp. 4876–4892

⁷ European Bank for Reconstruction and Development, Group C Countries Report, 2010, p. 197., and In-Depth Review of the Energy Efficiency Policy of Azerbaijan. Energy Charter Secretariat, 2013, Brussels. P.50-66.

For comparison purposes, the red line presents the electricity sector average of the Group C countries (EBRD, 2009). Substantial measures were taken for the formation of legislative basis in the power engineering sector, and improvement of legal basis concerning this field. Several laws were passed on power engineering, including the law on “Power Engineering”, “The Use of Energy Resources”, “Electrical Power Engineering”, “Electric and Thermal stations”, etc.

The Electricity Law requires that individuals and legal entities obtain special permission for conducting activities in the generation, transportation and distribution of electricity if not otherwise determined by law. As a general rule, special permission to carry out activities in the power sector is granted, and the contractors determined, on a competitive basis. The law provides that in certain cases permission may be issued without a tender on the decision of the MIE. The Electricity Law also provides that high-voltage installations cannot be constructed and put into operation without prior special permission unless otherwise provided by law.

2. Electricity prices

The regulated entities are required to provide economic justification for the expenses which make up part of prices (tariffs).⁸ The calculated tariffs are reviewed by the Tariff Council and published upon approval. A uniform tariff for the residential use and other tariffs for commercial and industrial enterprises are in force. In legal terms foreign capital investment in energy assets/companies is permitted and not restricted. Investments in new generating capacities are encouraged, and long-term electricity procurement is guaranteed.

The government has established a medium-term tariff policy that incorporates a transition to full cost recovery for utility service providers with a 10% return on equity. This will enable the utilities to become financially self-sustaining. The Tariff Council chaired by the Minister of Economic Development determines the retail and wholesale tariffs as well as the gas and fuel supply prices. The Tariff Council has powers to set tariffs for any kind of renewable energy, but only wind energy and mini hydro power tariffs have been set. There is no difference in tariffs between cogeneration and traditional power systems. At present, a uniform tariff is applied. The Ministry of Economy of Azerbaijan informed about ongoing discussion in the Tariff Council concerning possible adoption of support schemes (such as feed-in tariffs and feed-in premiums) for the development of renewable energy sector.

The regulated entities are required to provide economic substantiation of the expenses that are part of prices (tariffs). The calculated tariffs are reviewed by the Tariff Council and published upon approval. A uniform tariff for the population and other tariffs for commercial and industrial enterprises are in force. The following types of tariffs exist in the electricity sector: tariffs for the purchase of electricity from producers; wholesale electricity sale tariffs; retail electricity sale tariffs; export and import electricity tariffs.

Tariffs are calculated on a cost-benefit basis, using reports for previous years and actual data, as well as forecasted data, taking into account estimations by the utility companies. Table 1 reports tariffs for electric power and services including wholesale, retail rates and tariffs for consumers' day time and night time

Table 1. Tariffs of electric power, (Manat (AZN), 9 Euro)¹⁰

The name of services		Tariffs for 1 kVt/h (VAT included)
I.	Wholesale Rates	
1.2.	Power of Azerenerji JSC	5,7 AZN (3) EUR
1.3.	Private production of small hydro power plants	5,0 AZN (2,6) EUR
1.4.	Wind Power Stations	5,5 AZN (2,9) EUR
II.	Retail rates	
2.1.	For all consumers (monthly consumption up to 300 kVt) with a monthly consumption of more than 300 kW	7,0 AZN (3,6) EUR 11,0 AZN (5,8) EUR
III.	Transit transmission tariffs	
3.1.	Electricity transmission	0,2 AZN (0,11) EUR
IV.	Carried out directly on the power supply lines 35 and 110 square meters, which is stable demand for trucks per day, chemical and aluminum industry, mining based production of steel melting that the average energy consumption for the purposes of producing is not less than 5 million kilowatt/hour	
4.1.	Time of day (morning till 08.00-22.00)	5,8 AZN 3,1 EUR
4.2.	Night time (from 22.00 till 08.00)	2,8 AZN 1,75 EUR

3. Electricity system and power generation capacity

The power sector, along with the oil and gas sectors, has a leading role in the economy of Azerbaijan. Its importance is strengthening energy efficiency and to enrich the development of energy network in Azerbaijan economy. Azerbaijan is fully electrified, and electrical power is the third most utilized energy source (first is natural gas and second is oil) for domestic and industrial use. The sustainable development of the power sector is a top policy priority for the government. Table 2 reports the evolution of the installed capacity and generation of electricity from 1995 until 2013 in Azerbaijan.

Table 2. Electricity generation capacity (MWt) (1995 – 2013)¹¹

Years	The capacity of power plants at the end of the year (MWt)	TPP generation	HPS generation
1995	5 044	4 256	787,7
2000	4 912	3 990	921,9
2005	5 157	4 187	970,1
2010	6 396	5 401	995
2013	7 310	6 227	1083
2015	7 806	6 652	1 103
2016	7 910	6 726	1 105
2017	7 941	6 748	1 106

¹¹ State Statistical Committee of the Republic of Azerbaijan http://www.stat.gov.az/source/balance_fuel/

Azerbaijan's electricity sector is dominated by a vertically integrated company, Azerenergy JSC, which is a 100% state-owned enterprise. Azerenergy was established by Executive Order of the President No. 423 of 17 June 1996. It is the largest electrical power producer in Azerbaijan. Azerenergy JSC produces, transports, distributes and sells electricity throughout the whole country, except in the city of Baku where the electricity distribution is performed by Bakuelektrikshebeke (Bakuelectricnetwork) SC. Azerenergy is entitled to submit proposals on tariff increases and to take part in the tariff regulation process, but the final authority with regard to tariff determination in the electricity sector lies with the Tariff Council.

Azerenergy owns over 200 substations as well as 14 hydro power plants and 13 thermal power plants. Much attention should be paid to the issues of renovation and replacement of the outdated generating capacities of the power transmission system. The important aspect of the problem is close location of the utilities and the consumers to the generating capacities with a view to avoid loss in the energy system. Construction of some new power plants and substations and capital repair of available facilities are planned in the future.

Majority of Azerenergy electrical generation is done at thermal power plants where fossil fuels, mostly heavy fuel oil and natural gas, are used to power steam turbines or gas turbines. Coal powered generation ceased in 1991. Azerenergy has neither nuclear power nor geothermal generating capacity. Hydropower is for now the most important renewable energy (RE) resource in Azerbaijan and in 2010 hydropower satisfied about 18% of the need for electricity generation. Azerbaijan has about 1000 MW of operating hydropower capacity and an additional 62 MW of planned hydropower capacity.¹²

Although there has been little implementation of wind energy in Azerbaijan until the present day, interest has been growing. Its use has huge prospects in some regions of Azerbaijan. Calculations suggest that in Azerbaijan the economically feasible potential to produce about 800 MW of wind power. There are already planned projects of wind energy (Figure 2). The main potential is in the southeast around the Caspian coast.¹³ Wind turbines are one of the most technologically viable and cost-effective options (Morthorst and Chandler, 2004). However, land-use planning challenges pose a significant barrier to the further development of on-shore wind energy in many countries. When making determinations on new wind energy project applications, local planning authorities must balance the needs and views of the local public with the broader national targets and guidance for renewable energy development¹⁴.

Figure 2. Planning projects by the years 2014 – 2020¹⁵

¹² The largest Hydro Power Plant "Mingachevir" in Mingachevir city on the Kura River, renovated in 2001, 360MW; Some of the Hydro Power Plants reconstruction are completed, many of them is under construction and some of them in need of reconstruction.

¹⁵ State Agency on Alternative and Renewable Energy Sources (SAARES) <http://area.gov.az/>

The estimates of the solar, biomass and geothermal potential are more uncertain. Even though there is sufficient space to install solar panels, the estimated potential of 5000 MW can only be a long-term goal due to the relatively high upfront investment cost. Biomass utilization is equally unlikely without an incentive system in place. There exists only the potential of geothermal energy for heat supply, due to the relatively low temperatures of the wells.

The main barrier to RES development is the low tariffs with 3.2 US\$/kWh for small hydropower plants (HPPs) and 5.7 US\$/kWh for wind. Another barrier is the lack of a legal basis for connection rules.¹⁶ In order to overcome the barriers to developing RES in Azerbaijan two projects are relevant. The preparation and implementation of an action plan for RE and EE.¹⁷ Second is the improvement of legislation in the field of RE and EE, and compliance with the law of the European Union. This project is ongoing on the part of SAARES in co-operation with the International Academy of Ecoenergy. Azerbaijan is interested in finding solutions to the problems regarding environmental protection and the rational utilisation of natural resources. In support of Azerbaijan's environmental protection goals, a number of important laws, legal documents and state programmes have been developed and approved in order to improve the ecological situation in the country.

4. Dynamics of consumption-production and export-import

Today Azerbaijan's electricity generating capacities allow to completely ensuring the country's peak demand for electric energy. The country's generating capacities are used in various amounts and at different times, which depends on demand, weather conditions and seasons. Nonetheless, Azerbaijan has enough capacity to completely ensure the electricity supply. There are enough resources to ensure the peak energy demand of the country. It also allows exporting electrical power abroad. See the changes on electricity production in last 20 years on (Table 3).

Table 3. Electricity production in Azerbaijan (billion kWt/h) (1995-2017)¹⁸

Years	Electricity generation, billion.kWt/hour	TPP generation	HPS generation	non-energy facilities	through generators	wind power	solar photovoltaic energy
1995	17 044	15401	1 556	86,6	...	-	-

¹⁸ State Statistical Committee of the Republic of Azerbaijan http://www.stat.gov.az/source/balance_fuel/

2000	18 699	17 069	1 534	83,1	13,0	-	-
2005	22 872	19 344	3 009	430,5	88,0	-	-
2008	21 642	19 090	2 232	319,6	-	-	-
2010	18 710	15 003	3 446	259,7	-	0,5	-
2013	23 354	20 065	1 489	1798	-	0,8	0,8
2015	24 688,4	20 904,6	1 637,5	1 955,3			
2016	24 952,9	20 699,0	1 959,3	2 062,0			
2017	24 320,9	20 445,4	1 746,4	1 899,5			

Figure 4¹⁹ shows that how the balance changes after the year 2006. If before 2006 domestic consumption exceeded production, after 2006 the balance changes in favor of production. It gave opportunity to focus on export capabilities. However, one of the reasons for the fall in demand was substantial rises in tariffs tripled in January 2007 coupled with the implementation of the government's policy to install meters and increase bill collection, especially in the recent years for the Azerbaijan government has targeted to become an exporter of power generation in the region. This government program mainly played role to be targeted on preventing transmission and distribution losses, reforming energy legislation and framework to reach an energy efficiency result in economy. In other words, substantial rises in tariffs in January 2007 from 24 \$/MWh to 75 \$/MWh was not so significant if we compare the prices on Table 1 with the prices on Figure 3.

Figure 3. Dynamics of consumption and production of electricity in Azerbaijan for the years, (1995-2018), billion kWt/h²⁰

All above aspects promote the country to open a new stage of development strategy till 2020 in Azerbaijan. Securing long-term energy independence is a stated policy goal for fostering economic growth. One of the main goals was to

¹⁹ State Statistical Committee of the Republic of Azerbaijan http://www.stat.gov.az/source/balance_fuel/

reduce domestic dependence from gas and oil energy supply. Strengthening power generation and renewable energy construction became an important goal to perform.

Figure 4 shows the import-export dynamics of electricity power from 1995 to 2015. After 2006 the balance had changed. In 2007 Azerbaijan became an exporter of electricity power. In recent years the government has targeted to increase role of non-oil and gas sectors of economy.

Figure 4. Dynamics of export and import of electricity in Azerbaijan for the years (1994-2011)²¹

The demand on electricity is expected to double between 2012 and 2022, and to increase by almost 140% by 2025 (see Figure 5). The peak demand is also expected to double by 2022–2023 (USAID, 2013)

5. Transmission system; interconnections with neighbouring countries

²¹ Ministry of Energy of the Republic of Azerbaijan <http://www.minenergy.gov.az/?e=526&a=2> and Index Mundi, Azerbaijan Electricity Imports by Year <http://www.indexmundi.com/energy.aspx?country=az&product=electricity&graph=imports>

²² Azerenergy JSC, <http://www.azenerji.com/en/powersystem/powerlines.html>

Azerbaijan historically has been part of the transmission grid IPS/UPS of CIS countries with a common mode of operation and centralized supervisory control. It has an installed generation capacity of 300 GW, and produces 1,200 TWh per year for its 280 million customers. The IPS includes the national networks of Azerbaijan, Belarus, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Mongolia, Tajikistan and Ukraine. The Russian portion of the interconnection is known as Unified power system of Russia (UPS) and includes six regional transmission operators: ECO Center, ECO South, ECO North-West, ECO Middle Volga, ECO Urals and ECO Siberia. IPS/UPS is synchronously interconnected with the Baltic countries. In addition, it has an inter-link with the Nordic system via a back to back High Voltage Direct Current (HVDC) connection in Finland with a capacity of 1420 megawatts. Increasing transmission capacity and expanding the market by uniting with neighboring synchronous networks will make such manipulations more difficult.

Azerbaijan has a direct border with Russia, Iran, Turkey, Georgia and Armenia on the land and border with Russia, Iran, Turkmenistan and Kazakhstan by the Caspian Sea. Azerbaijan currently has one 330-kV line, one 110-kV line interconnection with Georgia, a 330-kV line, with another 330-kV line planned with Russia. Interconnection with Armenia includes a 330-kV line, one 220-kV line, and three 110-kV lines, all of which have been out of use since the Nagorno-Karabakh dispute. There are two 154-kV lines to Nakhchivan, one 132-kV line between Parsabad (Iran) and Imishli (Azerbaijan) and one 132-kV line at Astara (Azerbaijan). Finally, Turkey one 150-kV line and one 220-230-kV line via Iran both to Nakhchivan (Azerbaijan) and there exist plans to build a 500-kV line the following interconnections with its neighbors (Table 4).

Table 4. Azerbaijan Interconnections

Country	Type of Connection	Maximum Capacity (MW)	Current Status of Line
Armenia	One line 330 kV	420	non operational
	One line 330 kV		non operational
	Two lines 110 kV		non operational
Georgia	One line 500 kV	850	operational
	One line 330 kV	250	operational
Russia		500	operational
Iran			operational
			operational
Turkey		100	operational
		40	operational

Conclusions

Energy market grow and liberalization is a long process that requires strong and sustained political commitment, extensive and detailed preparation, and continuous development to allow for necessary improvements while sustaining ongoing investment. It is, in fact, a process that has not yet been completed anywhere in the world. In recent years some elements of dynamism have been introduced in the electricity sector through the privatization of mini-power plants and the establishment of two independent regional electricity distribution companies in Azerbaijan. With prospects of sustained demand growth through to 2020, the power sector will require substantial investment for the construction of new electric generation plants, refurbishment of existing facilities and strengthening of the power grid. The rehabilitation of the generation, transmission and distribution assets in the power sectors need to continue. This

will maximize the fuel burning efficiency and minimize the technical transmission and distribution losses. Also, future energy strategies and policies should be transparent and consistent with long-term goals and should consider initiating programs for energy efficiency and setting objectives for key sectors. In the future it will be necessary to ensure renewal of the capacities of the Azerbaijani thermal electric power station, which has been in service for 30 years, or provide alternative generating capacities. Besides that, wind power and solar photovoltaic energy must be developed as well as at the state level and at the household level in every apartment, especially in capital city where annual sunny and windy days exceed. It could contribute to energy efficiency of capital city, sustainable development, ecological issues and faster socio-economic development.

Implementing a good electricity sector liberalization program is a technical, institutional and political challenge. Furthermore, it is necessary to enhance energy security by increasing conventional and unconventional fuels production, utilizing renewable energy potential and maximizing energy efficiency gains and diversifying energy supplies via new interconnections with neighboring markets. Also, to increase a consumer excess potentially competitive segments as generation, marketing and retail supply could be vertically separated from segments that will continue to be regulated (distribution, transmission, system operations) either structurally or functionally. These changes are thought to be necessary to guard against cross-subsidization of competitive businesses from regulated businesses and discriminatory policies affecting access to distribution and transmission networks upon which all competitive suppliers depend. But in horizontal restructuring of the generation segment, to create an adequate number of competing generators to mitigate market power and to ensure that wholesale markets are reasonably competitive. In this way the application of regulatory rules and supporting network institutions to promote efficient access to the transmission network by wholesale buyers and sellers in order to facilitate efficient competitive production and exchange. This includes mechanisms efficiently to allocate scarce transmission capacity among competing network users, and to provide for efficient siting and interconnection of new generating facilities. Finally creation of independent regulatory agencies with good information about the costs, service quality and comparative performance of the firms supplying regulated network services, the authority to enforce regulatory requirements, and an expert staff to use this information and authority to regulate effectively the prices charged by distribution and transmission companies and the terms and conditions of access to these networks by wholesale and retail suppliers of power, are also an important but underappreciated component of successful reforms. Transition mechanisms must be put in place to move from the old system to the new system. These mechanisms should be compatible with the development of well-functioning competitive markets.

Abstract

The question of providing national and international security is a problem of high importance for nation-states. As terror-sourced threats cross national borders and target a larger geography of countries or even the entire world in the sequel of globalization, governments are inclined to make a greater effort to provide both national and global stability. Within this scope, the costs that are being faced with to reimburse the economic and social destruction caused by terror and to prevent further terrorist incidents significantly disrupt the economic development processes of countries. As a country with high risks of internal and external threats to security in consequence of its geographical position, Turkey is enduring considerable economic and social costs as well as making significant efforts in fight against terror. One important factor separating developed countries from developing countries is the human capital. Human capital is the knowledge, abilities and skills of a person that helps increase productivity in economic activities. Education is one of the most important elements of human capital. Terrorist incidents cause the implementation of economic development projects to remain inconclusive by posing an obstacle to education, which is a significant element of overall economic development. For this reason, it is becoming increasingly important to investigate the effects of terror on education to be able to maintain economic growth and development.

For this purpose, the effects of terror on education were investigated with the help of a time series analysis and the annual data from 1978–2017 of Turkey's economy. The findings obtained from the study suggested that a rise in terror led to a decline in expenditure on education. In this context, the reduction of terror in a country can help the realization of economic growth and development by having a positive effect on many important factors, especially education.

Key Words: Education, Terror, Time Series Analysis, FMOLS.

Introduction

It is known that terrorism, which became one of the leading concerns of public opinion at the international level, is deeply rooted in history. It has cut across all boundaries with the advancements in technology and has become one of the leading shared problems of the globe. Violent acts caused by terrorism have been threatening humanity in differing ways and scales for centuries.

Over the years, especially in the past century, there has been a constant change in the action patterns, objectives, strategies and weapons of terrorism. While the problem of terror arose largely from the political arguments early in the modern age, it has lately been featuring ethnic and religious differences in consequence of the structural changes it went through (Laqueur 1996: 25).

The issue of terrorism, on which states do not seem to be able to come to an agreement, has been increasingly discussed internationally since the beginning of the 21st century. With the advances in technology, terrorist groups emerging in different types and formats became increasingly more dangerous and destructive through the strict and quality training they undergo (Bal, 2006: 1). There are typically two suggestions to reduce the negative outcomes caused by terrorism. One of these suggestions is increasing the amount of funds reserved for defense

expenditures, and the other is to invest in educational and health expenditures to increase the welfare level of persons who might be affiliated with or sympathize terrorist organizations (Sezgin et al., 2008: 5).

In countries facing the problem of terrorism, the environment of trust and stability deteriorates, which results in interruptions in investments, especially in essential requirements such as employment, education and health. Thus, limited funds in the country are canalized into the defense sector, which drastically reduces the funds being used in other more active sectors. These circumstances pose an obstacle to progress in underdeveloped countries. Direct and indirect investments and human capital investments such as education and health are only possible through security and stability, which are the prerequisites for development and progress. Increases in general quality of life and social and cultural investments in the progress of society, especially in educational opportunities, form the basis of economic progress.

Progress is a far-reaching progress that involves quantitative increases in national income and production, fundamental changes in institutions, reforms in economic and social structures and changes in standards of judgments and behavioral patterns. To speak of progress in a country, there needs to be positive changes in people's mental structures and social habits as well as economic, social and cultural improvements in the society (Güner, 1978: 177).

A major element contributing to the development and progression of countries is education. Education has various positive effects including enhancing public awareness, promoting critical and analytical thinking, helping speed up technological advancements and promoting enhancement of sociocultural skills. Education also paves the way for the sustainability of economic growth and technological advancements by contributing to the development of intellectual advanced thought as well as to skilled labor that can adapt to changing life standards. Thus, it is crucial to increase the funds reserved for education while using these funds effectively to ensure social and socioeconomic development (Gündüz, 2017: 58).

Education is a process of providing knowledge and skills and contributing to the social adjustment of the individual. Education, in a broad sense, involves all modes of learning. More specifically, it refers to knowledge transferred in educational institutions. As far as the economic aspect is concerned, it is important to express how educational qualities are used in the production process and what they are beneficial for (Ünal, 1993: 225).

Being an input of production process, education contributes to economic progress and gives rise to positive changes in individual and social conduct. Besides its close relationship to economic progress, education is also highly important for providing social unity. Education is considered a crucial element in strengthening social unity, especially in ethnically, culturally and socially diverse countries. It is known that as the level of education in a society increases, crime and terrorism rates decrease rapidly, and governments acquire a more democratic stance. This in turn ensures a rather smooth economic development and progress (Krueger & Lindahl, 2001: 1107).

Levels of development in different countries can be evaluated based on various indicators. Two of the most significant of these indicators are the real GDP per capita and educational and health expenditures, which are also referred to as current investments of progress.

As far as studies investigating the relationship of terrorism and education are concerned, it is seen that theoretical studies are limited. Studies involving econometric analyses, on the other hand, are only rare. The findings that these studies provide suggest that the relationship between education and terrorism differ from country to country and that increase in educational funds has a deterrent effect on terrorist incidents. Major empirical studies of this particular context in the literature are mentioned below.

Krueger & Maleckova (2003) investigated the relationship between education, poverty and terrorism. Their study suggests that neither a high level of education nor poverty has a direct link to terrorism. It is mentioned in the study that many terrorists come from well-educated families and are financially well-off. Another model put forward in the study points to a negative correlation between per capita income and number of individuals involved in terrorism in the country.

Testas (2004) indicated in their study investigating data from 37 Muslim countries over the years 1968 to 1991 that internal conflicts, per capita income and education played a crucial role in the emergence of terrorism, which they stated to be a controversial subject. The level of education appeared to be a positive indicator of terrorism, whereas per capita income was a negative indicator. Increasing level of education leads to better trained terrorists and to more destructive terrorist acts being carried out.

Azam & Thelen (2008) focused on the importance of education. In their study looking into data from 176 countries over the years 1990 to 2004, they suggested that Western countries should support education in other countries through external funds to be protected from terrorist attacks.

In their study of Bosnia and Herzegovina, Swee (2009) stated that there was less participation in secondary education in areas more intensely affected by war and that boys were less likely than girls to participate in education. Shemyakina (2011) stated that the civil war that took place in Tajikistan from 1992 to 1998 has significantly and negatively affected the participation of children aged 7 to 15 in education. This effect was more evident in girls. Singh & Shemyakina (2013) indicated that the civil war that took place in Punjab region from 1981 to 1993 significantly declined enrollments in school and that this decline was significantly higher for girls.

Güvercin (2018) investigated the impact of terrorism on education practically for 80 cities in Turkey. In the study where the terrorism index was used as the independent variable, it was found that the decrease in participation in secondary education was much higher in the Eastern cities of Turkey compared to the cities in other regions.

Analysis

Research Period and Data Set

The present study aims to determine the impact of terrorism on education in Turkey through a time-series analysis. In accordance with this purpose, variables will be generated considering annual series of the period of 1978 – 2017. In empirical studies using macroeconomic variables, it is common to take logarithms of series. One important reason for this is to stabilize the variance of the series that is demonstrating an exponential change at level by transforming it to a linear function. For this reason, all series in this study have their logarithms taken.

The model used in the present study is as follows:

$$LEDU_t = \beta_1 + \beta_2(LTER)_t + \beta_3(LGDPP)_t + \beta_4(LSTU)_t + u_t$$

Definitions and ways of acquisition of variables used in the model are given below:

LEDU: Involves all public expenditures for education. It is acquired from World Bank database in the nominal (USD) form and is converted into the real form through the GDP deflator of the country.

LTER: Refers to the terrorism index for Turkey. It is compiled from the Global Terrorism Database set of START, which is an internationally acclaimed research and education center.

LGDPP: Refers to real GDP per capita. The number is acquired from World Bank database in real (USD) values.

LSTU: Refers to the total number of enrolled students in Turkey as acquired from the websites of Turkish Statistical Institute and Council of Higher Education. Descriptions and sources of variables will be summarized below in a table.

Table 1. Variables and Sources

Variables	Definition of Variables	Data Sources
LEDU	Real Education Expenditures	World Development Indicators
LTER	<i>Terrorism Index (Turkey)</i>	<i>Global Terrorism Database</i>
LGDP	Real Gross Domestic Product Per Capita	World Development Indicators
LSTU	<i>Total Number of Students</i>	<i>Turkish Statistical Institute and Council of Higher Education (Turkey)</i>

Unit Root Tests

To obtain reliable results from time series analyses, it is primarily necessary to investigate the stationarity of the series. Regression analyses conducted without being subject to unit root tests are bound to lose their reliability, and it is not going to be possible to test whether the series are cointegrated (Feltham & Giles, 2003: 153).

ADF and PP Unit Root Tests and Results

Augmented Dickey Fuller (ADF) and Phillips-Perron (PP) unit root tests are among the most widely used tests in determining the stationarity of series in time series analyses. Thus, these two tests were the preferred methods of analysis in the present study. Table 2 below shows the results of ADF and PP unit root tests applied for the series.

Table 2. Results of ADF and PP Unit Root Tests

Variables	ADF		PP	
	Intercept	Intercept and Trend Level	Intercept	Intercept and Trend
LEDU	-0.31	-2.57	-0.28	-2.27
LTER	-1.55	-1.61	-1.84	-1.89
LGDP	-0.60	-2.00	-0.52	-2.02
LSTU	-0.59	-2.37	-0.54	-2.49
		First Difference		
LEDU	-6.27*	-6.19*	-6.29*	-6.21*
LTER	-5.47*	-5.46*	-5.48*	-5.46*
LGDP	-6.26*	-6.17*	-6.29*	-6.19*
LSTU	-6.08*	-6.01*	-6.35*	-6.29*
		Critical Values		
% 1	-3.65	-4.26	-3.65	-4.26
% 5	-2.95	-3.55	-2.95	-3.55
% 10	-2.62	-3.21	-2.62	-3.21

Note: The asterisk (*) indicates that the variables are stationary at the 1% significance level. Critical values in ADF and PP tests were based on the critical table values by MacKinnon (1996).

When Table 2 is considered, it is apparent that all series used in the models are stationary at the first difference [I (1)]. Thus, Johansen Cointegration Test is to be used to investigate the cointegration relationship between the series.

Johansen Cointegration Test and Results

The first study on the theory of cointegration is the single-equation cointegration analysis by Engle & Granger (1987). This analysis was later further developed by Johansen (1988) as ‘multiple-equation’ consisting of a system of simultaneous equations. Johansen cointegration method, which is based on vector autoregression (VAR), is considered to be more powerful in determining cointegration relationships in case of multiple independent variables. The advantage of Johansen cointegration analysis over the Engle-Granger method is that the series contain more information due to the use of level values related to the series in long-term analyses. The greatest limitation in Johansen analysis is the need for the series to be included in the analysis to be stationary at the same order (Doğan et al., 2016: 415-416).

In this method, characteristic root numbers are calculated using the following two statistical methods:

$$\Lambda_{\text{iz(trace)}} = -T \sum_{i=r+1}^m \ln(1 - \lambda_i)$$

$$\Lambda_{\text{max}} = -T \ln(1 - \lambda_{r+1})$$

λ_i , estimated above refers to estimated values of eigenvalues acquired from the π matrix, while T refers to number of observations given in the model. The trace statistics test the alternative hypothesis of “there are more than r cointegrated vectors” against the null hypothesis of “there are maximum r number of cointegrated vectors”. Maximum eigenvalue statistics on the other hand test the alternative hypothesis of “there are r+1 number of cointegrated vectors” against the null hypothesis of “there are r number of cointegrated vectors” (Love & Chandra, 2004: 487).

Johansen cointegration test assumes all variables to be endogenous. Therefore, it is necessary that estimations are made via matrices and vectors. For this reason, it is primarily essential to estimate the VAR model and to determine optimal lag lengths (Sevüktekin & Çınar, 2014: 593).

Table 3. Lag Length Test Results

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-16.43438	NA	3.55e-05	1.104561	1.278714	1.165958
1	121.3626	238.3515*	4.94e-08*	-5.479060*	-4.608293*	-5.172074*
2	126.3997	7.623780	9.23e-08	-4.886473	-3.319093	-4.333898
3	137.6241	14.56132	1.30e-07	-4.628329	-2.364337	-3.830166

Note: (*), indicates the optimal lag length for each model selection criterion.

Referring to Table 3 above, it is apparent that the optimal lag length is one (1) in terms of all information criteria.

Table 4. Johansen Cointegration Test Results

Cointegration Rank Test (Trace)				
(H ₀)	Eigenvalue	Trace Statistic	0.05 Critical Value	Probability

$r \leq 2$	0.202062	8.351788	11.22480	0.1532
$r \leq 3$	0.005003	0.185564	4.129906	0.7210

Note: (*), shows that the H_0 basic hypothesis at 5% significance level is rejected and that the test statistics are significant.

When the results in Table 4 above are evaluated, it is seen that there is a long-termed relationship between series that are investigated through both maximum eigenvalue test and trace test. Since the maximum eigenvalue test values and the maximum trace test values are greater than the critical value at 5% significance level, H_0 hypothesis suggesting 'no cointegration' is refuted for this significance level. Thus, there is a cointegration relationship between the variables.

While a cointegration exists between variables, and as they are first-order stationary, estimating such a model with the ordinary least squares method (OLS) causes deviations from the actual properties of OLS, which is unbiased, consistent and efficient. Besides, once the properties of the OLS estimators are disrupted, the efficiency of the technique to be applied is also disrupted; so, the hypothesis tests are no longer valid. Thus, while the two variables are cointegrated, the relationship between the explanatory variables and error terms emerges and leads to the problem of endogeneity. In this case, variables lose their asymptotic properties. The FMOLS method was suggested to overcome this problem (Berke, 2012: 250-251). The results of estimations regarding long run coefficients are given in Table 5 below.

Table 5. Long Run Coefficients Forecast Results

<i>Model : $LEDU_t = \beta_0 + \beta_1 LTER_t + \beta_2 LGDPP_t + \beta_3 LSTU_t + u_t$</i>				
Variables	Coefficient	Standard Error / Probability	R^2	Adj- R^2
LTER	-0.54*	0.013 (0.0002)		
LGDPP	0.47*	0.001 (0.0000)		
LSTU	0.57*	0.167 (0.0018)	0.847	0.838
C	0.01	0.005 (0.5421)		

Note: (*), indicates the significance level of 1%.

FMOLS results used to estimate long run cointegration coefficients are given in Table 5. According to the FMOLS results, the coefficients of all independent variables are as expected and are statistically significant. The results of the estimation suggest that a 1% increase in terrorism results in a 0.54% decrease in educational expenditures. In addition, it was found that a 1% increase in real GDP per capita led to approximately 0.47% increase in educational expenditure, whereas a similar 1% increase in total number of students produced an approximate 0.57% increase in educational expenditure. The model had an explanatory power of $R^2 \cong 0.84$, suggesting that the independent variables accounted for the presence of the dependent variable at a rate of approximately 84%.

Discussion and Conclusion

Education is one of the leading elements in preparing individuals to become members of society. Education tries to adapt individuals into society by preparing them for social life. The level of development of a society is closely linked to the access the people in that society have to a quality education through which they can give back to their community. Studies in the field of education prove it to be the most effective factor for socio-economic progress. Education is crucial not only for economic progress but also for political and cultural development, technological innovation and global competitive power. An important element through which

developed countries differ from others is their level of education and knowledge. Falling behind in education qualitatively or quantitatively either due to terrorism or economic reasons hinders social development and progress. Thus, before anything else, it is necessary to transfer economic sources into sectors with high output, with education being in the first place.

The present study investigated the effects of terrorism on education. The findings of the study produced similar findings to those investigating the relationship between educational expenditure and terrorism with the use of econometric analyses. A significant decrease in educational expenditure parallel with an increase in terrorist acts was identified in Turkey. This finding reveals the effect of terrorism on education at present in Turkey and provides important warnings for countries facing similar problems.

Thus, it is crucial for countries to improve their understanding of social state to reduce the negative outcomes of terrorism. One of the major duties of a social state is to provide fundamental needs such as education, health and security to their citizens in a fair manner. Otherwise, the image of a country that is insecure and distant from its people in national and international spheres make economic growth and progress difficult.

Initially, it is necessary to increase the level of education in the society through increasing the share of national income reserved for education, therefore reducing sympathy for terrorism, which results in great destruction. It can be foreseen that, in the contrary case, the destructive effect of terrorism will increasingly continue.

Abstract

At present, issues of devaluation of national currencies are becoming relevant due to the need for many governments to stimulate economic development. Devaluation is primarily due to macroeconomic factors. The subjects of research are the current state of the monetary system of various countries, the reasons for the devaluation of national currencies, the impact of the change in the key rate of the US Federal Reserve on the economies of other countries. A direct depreciation of the currency is made on the basis of a decision of the central bank or other regulatory authority of the country. Such a decision can be made in the form of an official depreciation of the national currency, refusal to support the exchange rate, refusal from the currency corridor, or from pegging the national currency to other countries' exchange rates or to currency baskets. The main objectives of the devaluation are to reduce the deficit of payment balance, increase the competitiveness of national goods on the world market, and stimulate domestic production. A significant increase in the volatility of the national currency rate, caused by both the devaluation of national currencies and the change in key rates of central banks, requires more careful study. The monetary authorities of any country constantly have to choose how to conduct an independent monetary policy. In one case, they should refuse to regulate the exchange rate, in the other they should adhere to the fixed exchange rate regime at the price of abandoning independent monetary policy.

The reasons for the devaluation are different in countries depending on the cost of raw materials extracted and countries where the economy is focused on the production of goods and their sale in foreign markets. In the first case, this is the execution of the budget, and in the second - the protection of domestic producers. The decision of the National Bank to devalue the national currency indicates that this method is resorted to when traditional levers of influence on the economy do not work. The devaluation of the national currencies of major economies suggests the beginning of currency wars between major economic powers. The current practice of devaluations suggests that, as in the past century, the main objectives are to increase competitiveness and the formation of a deficit-free budget. States with market economies always strive to balance their economies, including the way of devaluing the national currency. Devaluation becomes relevant in the context of uneven inflation in an open market economy, that is, due to macroeconomic factors. The goals and the level of devaluation are different in different countries. The level of devaluation of the national currency is influenced by gold and foreign exchange

reserves, the dependence of the country's budget on the cost of resources sold, diversification of the economy and other factors.

Keywords: devaluation, hidden devaluation, national currency, exchange rate, inflation, monetary policy, budget deficit, central bank, gold and foreign exchange reserves

1. Introduction

The Great Depression in the early 1930s led to the rapid refusal of all countries from the gold standard, with the exception of the United States. Although formally the gold content of the currency could be preserved, but only as an exchange rate indicator relative to other currencies. In the United States, however, during this period, gold was legally removed from private ownership. At the same time, trying to counter the deepening of the economic downturn, all participants of international trade took the path of sharply increasing tariff and non-tariff barriers, as well as restrictions on cross-border capital movements. In such conditions, the simplest way to ensure net exports was a competitive devaluation. Since practically all countries have taken this path, this phenomenon was later called currency wars [1]. However, a sharp rejection of the gold collateral for their currencies and competitive devaluations caused even greater difficulties in servicing foreign trade payments. As a result, the share of barter in international trade increased, and clearing unions were created to solve the problems of net-importers through the organization of offsets. In such conditions, the currency in international trade from an objective indicator of the balance of supply and demand for goods, services and capital between different countries gradually began to turn into a policy-based means of payment.

The active use of the exchange rate of a number of countries as an instrument of the state's economic policy in order to establish macroeconomic equilibrium in the national economy requires studying how the causes, ways, and degree of goal achievement are achieved. At present, the issues of devaluation of national currencies are becoming relevant in connection with the emergence of the need in many governments to stimulate economic development. Devaluation is due to previous aggregate macroeconomic factors. Direct depreciation is based on a central decision of the bank or other regulatory body of the country. Such a decision can be made in the form of official devaluation of the national currency, refusal to support the exchange rate, currency corridor or pegging the national currency to other exchange rates of countries or to currency baskets. The main objectives of the devaluation are to reduce the balance of payments deficit, increase the competitiveness of domestic goods on the world market, and stimulate domestic production. The term "devaluation" refers to the process of depreciation of the national currency, that is, the main currency for settlements in one territory. Devaluation is the official state-recognized depreciation of the national currency against foreign currency rates.

In a globalized world financial system, devaluation processes go beyond the limits of one country and describe the ratio of exchange rates relative to each other. This is the main difference from inflation, which describes the dynamics of prices strictly within one country. After the abolition of the gold money equivalent, devaluation became the main means of manipulating currency to increase the internal competitiveness of commodity producers. In the XX century, there were more than 400 devaluations of national currencies. In all countries, growth processes occur continuously, or currency depreciation occurs. It is believed that the depreciation of any currency can be called a devaluation if it is significant enough.

2. Methodology

Using the methods of observation, grouping, induction, deduction, and classification, we analyzed the devaluations in different countries.

3. Literature Review

Historically, devaluation analysis has focused on potential income and employment effects. Devaluation was primarily seen as a means of supporting national exports and improving the competitiveness of exported goods on the international market. In the 1930s, countries facing domestic pressure decided to devalue their national currencies in the hope of easing domestic pressure.

There are a number of modern scientific research on the development and improvement of theories that study the devaluation of national currencies. If it is theoretically assumed that financial globalization will lead to full capital mobility, then, in accordance with economics, ideas about the effectiveness of monetary policy are primarily due to the chosen exchange rate regime. This presentation is mainly based on the Mandell-Fleming model, which is an extended version of the IS-LM model of neoclassical synthesis for an open economy [2]. It should be noted that the model of application of Mandell-Fleming is becoming traditional for assessing the effectiveness of monetary policy in the specified conditions. The monetary authorities of any country constantly have to choose how to conduct an independent monetary policy.

In one case, they have to abandon the regulation of the exchange rate, in the other, to adhere to a fixed waiver of the exchange rate with the price of an independent monetary policy. This choice was a textbook and received the name of the position of the so-called impossible trinity (impossible trinity). This implies that the economy can not simultaneously be present at a fixed exchange rate, full capital mobility and monetary policy aimed at achieving domestic goals. The changing conditions in the global economy associated with the growth of capital between countries have responded to two main areas: the continuation of the line of R. Kahn and J.M. Keynes[3,4]. The influence of the central bank on economic activity in the short term is limited by the rapid growth of short-term mobile capital flows. When central banks lower interest rates, they leave the country in search of higher returns, which have a huge impact on economic development.

In the long run, capital outflows due to monetary policy easing can lead to a fall in the exchange rate. As a result, on one hand, exports will be stimulated, and on the other, inflation will be accelerated, including through rising prices for imported goods. Therefore, we agree with those scientists who believe that the effectiveness of monetary policy is directly dependent on the choice of the exchange rate regime. This process itself plays an important role in the context of financial globalization, especially in that monetary policy, including the devaluation of the national currency, is becoming increasingly interconnected with the ongoing monetary policy in the country. Practice shows that the liberalization of currency restrictions should be carried out in a more balanced way, since it carries additional risks. At the same time, a double task falls on the national central banks: maintaining the stability of the domestic monetary sphere and the financial system. An important remark was made by M. Aglietti and A. Orleans: the time of the inflation round was replaced by the volatility of prices for financial assets at the same time as the potentially deflationary effect for the economy in the event of a sharp fall in interest rates on financial markets [5]. According to the researchers, this is what contributes to resolving tensions in highly centralized national financial systems. These scholars are focusing on the deflationary nature of economic crises, noting that under these conditions there is a fall in asset prices, which means that we have to talk about trends in the rise of deflation. The situation in economically developed countries influences modern inflationary processes in other countries. This leads to the inability of national governments to service debt in foreign currency at current rates. The result is the likelihood that leading countries will be able to restructure the debt burden on their own budgets and thereby lose trust borrowers and investors. As a result, any budget deficit will sooner or later be monetized by currency devaluation. Some scholars are considering a new scheme; the functioning of monetary zones is not based on the demand for money, but on the supply and demand of borrowed funds provided by banks, and paying considerable attention to institutions. Thus, according to their concept, there is the possibility of active monetary policy even in the context of financial globalization, leading to a gradual leveling of interest rates.

The fact is that in these conditions the national central bank may provide funds to commercial banks in the country and thereby affect the loan offer. However, as Russian practice shows, interest rates on devaluation and interest rate deduction can lead to additional devaluation, since borrowing money from commercial banks of the central bank does not lend to the economy, and withdrawing money to the foreign exchange market for speculation. Therefore, in modern economics, trying to study the causes and consequences of changes in exchange rates, there are different directions, schools and directions. Nevertheless, we agree with the conclusions of M.A. Panilova that the whole diversity of exchange rate theories can be reduced to two approaches: regulatory and positive [6]. A positive approach assumes the exchange rate of research as a given goal, then its dynamics are studied and future values are predicted. The regulatory approach considers what the exchange rate should be in terms of optimal economic policy. Valuation issues are also addressed in the ever-

improving balance of payments theories. E.M. Petrikova, having studied the existing basic billing theories of balance, comes to the conclusion that in the new world the monetary system should satisfy a number of conditions:

- its operation should not be dependent on any national or interstate financial institutions;
- it is designed to promote effective international payments and build financial and economic relations between countries;
- it should automatically smooth out payment imbalances and minimize the occurrence of financial crises in the global economy [7].

There are many reasons that cause the devaluation. Usually this phenomenon occurs under the influence of various macroeconomic factors. Reasons that lead to a fall in the value of the national currency include the payment deficit (the state does not have enough funds to pay its own obligations to other countries), deterioration in the country's trade balance when imports exceed exports, and high inflation. Devaluation can also occur due to the weakening of the state's economy as a result of crises, wars, natural disasters, and major technological accidents.

4. Analysis of the problem

Consider how countries are oriented, resorting to the devaluation of the national currency. The Basel Bank for International Settlements has published a report stating that in a number of leading Western countries, basic discount rates are at a record low, which has already led to a certain imbalance in economic development, debt growth and, as a result, financial risks. Productivity becomes too weak, and the room for maneuver in macroeconomic policy is limited [7].

The report also notes that the decline in oil prices has already led to certain structural changes in the economy. Now it should take advantage of the central banks of the leading countries of the world and move away from policies that focused solely on monetary regulation. As you know, there is a Keynesian approach, and then the operational use of money as a tool for daily management of the economic situation and the pace of stimulating economic development. The Basel Bank for International Settlements proposes to limit the effect of spontaneous market stabilizers. One of the ways to stimulate the economic development maneuver is the devaluation of the national currency. The current practice of devaluation suggests that, as in the past century, the main objectives are improving competitiveness and the formation of an adequate budget. Market economies always strive to balance their economies, including by devaluing the national currency. For example, the National Bank of Switzerland (SNB) in early March 2009 took a number of measures to weaken the national currency. This happened after he stated that a strong national currency creates an “inadequate complication of monetary conditions” during a period when the central bank is struggling with a recession in the Swiss economy. Pursuing the goal of supporting domestic producers in the current crisis conditions in the hope of increasing the competitiveness of the national economy, the Swiss central bank deliberately devalued the national currency. Thus, Switzerland deliberately went to the depreciation of its franc against other currencies. The intervention of such a large central market activity of the bank actually opened the way for other central banks to follow their example. Analysts say that this step contributed to the beginning of competition between countries in the field of devaluation.

The central banks of different countries periodically implement various programs to stimulate their economies through monetary measures. However, the example of a Swiss bank that tied the franc to euro values of 1.2 showed that the use of hard pegs even for economically developed countries is fraught with risk. The fact is that the debt crisis in Europe made the Swiss franc an interesting currency for keeping funds. However, such a hard relationship required the acquisition by the National Bank of Switzerland of increasing the amount of the euro and spending its gold reserves. In the spring of 2015, the SNB abandoned the hard peg and intentionally went to strengthen the national currency.

Such a rigid peg to any currency, even through devaluation, makes the currency of a given country dependent on the monetary policy of other countries. Japan is one of the most economically developed countries actively using

the devaluation of the national currency to restore its economy. The peculiarity of the Japanese economy is that it has a minimum of natural resources. On one hand, this reduces the dependence of the national currency and budget on the cost of hydrocarbons. At the same time, the indirect costs of hydrocarbons affect the economy of Japan, as it is forced to buy oil products abroad.

The economic revival under the leadership of Japanese Prime Minister Shinzo Abe has even been given the name “abonomics” when it emerges from deflation traps; the printing press is used as the main incentive measure. The essence of monetary policy was not to prevent inflation, but to overcome the negative consequences for deflation of the economy (inhibition of consumer and investment demand). As a result, the competitiveness of export-oriented producers increased in Japan. However, the monetary policy pursued in this direction forced investors to withdraw funds from Japanese securities and invest money in euro denominated bonds. At some point, this led to the creation of illusions for overcoming the crisis in a number of European countries (Italy, Spain, etc.). At the same time, Asian countries have reacted negatively to Japan’s monetary policy. Another reason for the devaluation is the need to form the country's budget deficit and its balance. This basis for devaluation is observed in countries where budgeting depends on hydrocarbon prices. Russia and the Republic of Azerbaijan belong to this group.

Figure 1. The dynamics of the dollar-ruble [9].

In August-September 1998, the dollar exchange rate soared 3, 4 times in Russia from 6.18 to 21 rubles. In January 2000, it was already 29.5 (4.8 times as compared with August 1998). In the period from August 2008 to January 2009, the dollar soared 1.6 times from 23.40 to 36.45. July- December 2014 the rise of the USD / RUB rate 2.35 times from 33, 70 to 79.25 (see figure 1). The peculiarity of Russia lies in the fact that a model of economic growth has been formed, focused on the conversion of oil and gas in the form of super-profits in domestic demand. She was provided with a rapid increase in wages in all sectors and social transfers, increasing macroeconomic stability. But business strategies turned out to be focused on expanding production, and increasing efficiency did not become a priority.

Devaluation in Turkey, Russia, Iran, Kazakhstan, Ukraine, Belarus, Georgia and other neighboring countries has resulted in an increase in the prices of products produced in Azerbaijan compared with the products produced in

these countries, while reducing the volume of exports of such products from the country, the increase in imports from neighboring countries had a negative impact on the foreign trade balance and caused a currency outflow from the country. At the same time, domestic and foreign investors invested their assets in Azerbaijan by selling their assets in Azerbaijan, using high-valued assets in Azerbaijan to strengthen their foreign exchange flow. Increased import volumes, declining export volumes, increased foreign exchange demand in the foreign exchange market, in turn, increased the pressure on the manat [10].

The government hoping that oil prices would rise again soon as it was in 2008-2009, only the Central Bank's monetary reserves were only pursuing a policy aimed at maintaining the exchange rate of manat against foreign currencies in the foreign exchange market in January 2015 - January 2015 the Central Bank's foreign exchange reserves decreased by 16.5% in absolute terms and in absolute terms by US \$ 2513.4 million to US \$ 12680 million [8]. Consequently, the foreign exchange reserves of the Central Bank, saving stock and improving the competitiveness of products produced in the country, on February 21, 2015, the Central Bank decided to devalue the manat and converted 1 dollar to 1.05 manat, 1 euro = 1.19 As a result of the devaluation, the US dollar appreciated by 34.6% against the manat, while euro by 33.7% . The rise in foreign currency caused some problems in the socio-economic life of the country. There were problems with payment of foreign currency loans, the prices of imported products began to rise. Changes in exchange actualized the increase in prices for the products produced in the country.

Devaluation has further aggravated existing problems in the agricultural sector. It turned out that the production of wheat flour produced in the country was inefficient, and both flour and wheat was imported from abroad to meet the demand. Therefore, at the end of March, a 25% drop in bread prices was observed, which touched the interests and resulted in dissatisfaction of the massive population whose nominal income remained unchanged. To eliminate this problem, value added tax (VAT) on wheat import was abolished according to the relevant decree of country's President. The measures taken by the President on the artificial price increases were strengthened. The devaluation of the manat will allow the State Budget to deduce from the Oil Fund. Thus, the amount of transfers from the Oil Fund in the budget draft for 2015 was estimated at 10388 million manats, which would have been \$ 13317.95 million ($\$ 1 = 0.78$ manats) in US dollars [11]. After the first devaluation of manat, the Oil Fund had to use \$ 9893.33 million to get 10388 million manats to be transferred to the state budget, which would save 3424.62 million dollars.

After the February devaluation, it was assumed that the pressure on the manat would end and the stability in the currency market would continue. But not everything was as expected. Thus, in March-December 2015, intervention of the Central Bank (CB) into the currency market was continued in order to preserve the new exchange rate of manat. As a result, during the month of February 2015, the CB's foreign exchange reserves in absolute terms amounted to 4758.8 million dollars, and relative expression decreased by 1.76 times. Negative processes in the currency market and exhaustion of foreign exchange reserves in the currency market forced the Azerbaijani government to make a decision on the new devaluation of the manat by shifting to floating exchange rate policy. On December 21, 2015, $\$ 1 = 1.55$, and at 1 euro = 1.7 manats were assigned. According to the official data of the CB of Azerbaijan, the rate of manat on December 21, 2015 increased by 47.63% or 0.501 AZN compared to December 18 and accounted for 1.55 AZN [12,13]. As for the euro exchange rate, the single currency of the Euro Zone has increased by 47.88% or 0.5456 manat and accounted for 1.6850 manats. The rate of Russian ruble against the manat increased by 47.3% or 0.007 manats, which accounted for 0.0218 manats. In general, as a result of devaluations in 2015, the manat was 98.7% against the dollar and 91% against the euro. CB transition to floating exchange rate and re-devaluation of manat further aggravated the problem of credit debts in foreign currency in the banking sector. The devaluation of manat in some sense has caused a disturbance among the population, and those who lost their trust in the national currency decided to convert all that is left to foreign currency, which, in turn, increased foreign exchange demand in currency market.

A similar model is used in the Venezuelan economy. Since currency regulation here has its specifics (the dollar circulation in the country is limited), a sharp decline in oil prices aggravated the situation in the economy. More than 90% of Venezuelan exports go to the oil, and when its price drops by more than 50%, the country is approaching default. Analysis of the largest oil exporters in the world in 2008 indicates that in different

countries the exchange rate regime was different. The majority of the OPEC countries preferred saving a fixed exchange rate to the national currency of the United States. Thus, they haven't used devaluation even despite the fall in oil prices (Saudi Arabia, UAE) or used it, but at a minimum amount (Kuwait, Qatar). For them monetary stability turned out to be more important. A group of other countries (Venezuela, Iran, Malaysia, Turkmenistan) is not a market for national currency formation. The inability to convert national currency together with the possibility of manipulating trade and investment flows at various rates allowed this country to depreciate their currencies by no more than 3-3.5%. The countries in the third group, where a floating exchange rate was used, carried out a massive devaluation. In the group of oil exporters, the devaluation since mid-2008 was 24-27%, and in the group of gas exporters 21-25%. In our opinion, one of the important aspects of devaluation's success is its speed. The Central Banks of Norway and Australia rapidly devalued, and the rate was 0.25-0.31%. The Russian ruble depreciated against the dollar by almost double- 0.18 per share. As the experience of Norway and Australia shows, a quick devaluation allows you to adapt to the changing conditions of international commodity markets. A cursory depreciation of the Norwegian and Australian currencies ended in the late 2008 and changed the stabilization and strengthening.

A closed economy with a significant drop in commodity prices and budget imbalances, as well as the lack of reserve funds formed in the country during the period of high hydrocarbon prices, is forced to devalue the national currency. For example, in Venezuela in February 2013, the national currency devalued against the US dollar by 46.5%. This decision was made due to the need to increase the financial performance of the government and minimize budget expenditures. Devaluation is designed to optimize revenues, especially aimed at financing social programs for the poor in Venezuela. Most of the economic work devoted to the success of Norway and the positive experience in dealing with the "raw curse" was that the main reason for the success of the policy was the development of the institutional environment in the broadest sense of the word. Consequently, the Norwegian way is to create a developed economic environment with a low level of corruption while protecting market and competitive mechanisms.

A number of countries that are not oil exporters also had to devalue the national currency in 2014. For example, the new Israeli shekel was devalued by 12.7% at the end of July 2014. Local economists point out that the country's economy was directly affected by the economic downturn in Russia. Israeli goods worth \$ 3 billion were imported into the country annually, primarily agricultural products (fruits, vegetables, flowers). In 2014, the National Bank of Kazakhstan also devalued the tenge. The main reasons cited were the bad economic situation in the BRICS countries, capital outflows from developing countries, the transition to the free formation of the Russian ruble exchange rate. In 2014, in total imports to Kazakhstan, goods from Russia accounted for 36.2%. The export of goods from Kazakhstan to Russia is three times less than this volume. Thus, the National Bank of Kazakhstan devalued, pursuing the main goal-to protect domestic producers. As you can see, the devaluation of the national currencies of oil exporters leads to the need to devalue the currencies of the countries economically related to them. And some spend it in order to preserve the supply of their products to the country's market, devaluing their currency, others - to protect domestic producers. About 20 developing countries devalued national currencies in 2014–2015.

Fig. 2. Consolidated forecast of leading banks and investment companies [9].

Separately, the National Bank of China made a decision on the devaluation of the national currency. This was primarily due to the need to support the country's economy, since the traditional levers almost ceased to operate. The devaluation of the Yuan has become a tool that will solve economic problems.

It should also be noted that the decision of the People's Bank of China followed the refusal of the International Monetary Fund to recognize the currency reserve of China. After that, the PRC became free in making decisions about promoting its exports. However, we believe that the Bank of China is ahead of the US Federal Reserve in the increase of interest rates in the fall of 2015. This allows you to talk about the beginning of currency wars between the largest economic powers in the world.

Devaluation in developing countries in recent years has attracted the attention of economists of the Financial Times. Their study of changes in national exchange rates of 107 countries in 2013–2015 and their export and import in subsequent years showed that there is no statistical link between currency devaluation and export volume, so the former does not lead to an increase in the latter [14].

We believe that this study to some extent replaces the ultimate goal of the devaluation of the national currency, primarily as a result of the fact that in this case the volume of oil supplies was measured, not the value in national currency. The sale is carried out in dollars, and domestically this revenue is converted at a new rate, which allows the budget to be executed with a minimum deficit.

An overview of national currencies shows that targets and levels of devaluation are not the same in different countries. However, the objectives of devaluation include:

- protection of domestic producers;
- ensuring the execution of a deficit-free budget;
- preservation of foreign exchange reserves.

The level of devaluation of the national currency is influenced by:

- ✓ the level of foreign exchange reserves and, accordingly, the ability to support the budget;
- ✓ the dependence of the country's budget on the cost of resources sold;
- ✓ economic diversification;
- ✓ the dependence of the national economy on the economic policies of countries devaluing their currencies.

5. Conclusions and suggestions

Devaluation, being an economic process, has its pros and cons. The emergence of devaluation entails a number of risks for the state economy.

The disadvantages include the consequences of devaluation:

- loss of business reputation, the country becomes less attractive for foreign partners;
- a significant decrease in the standard of living and purchasing power of citizens of the country;
- reduction of social payments;
- loss of confidence in the national currency;
- decline in imports. Due to the high price, imported goods become uncompetitive;
- reduction of investments and production resources attracted from abroad;
- withdrawal of funds abroad;
- acceleration of inflation. Usually, devaluation is accompanied by inflation — price increase for consumer goods are mainly imported;
- massive transfer of savings to more stable foreign currencies;
- early closure of bank deposits, unwillingness to keep funds in accounts;
- a significant weakening of the financial and banking services market.

The advantages include the consequences of devaluation:

- improving the country's balance of payments;
- a significant increase in revenue derived from export currency transactions. To sell goods for depreciating national currency in the domestic market becomes unprofitable, which leads to an increase in exports of goods.

This, in turn, increases the inflow of "hard" currencies into the country;

- reduction of gold and foreign exchange reserves. With devaluation, there is no need to support the artificial exchange rate of the national currency at the expense of gold and foreign exchange reserves.
- a significant increase in demand for national products and goods of own production;
- a significant increase and a significant increase in its own production.

Due to the realization of any part of the above options, the value of foreign currency is artificially reduced, the population stops the mass exchange in US dollars and euro and starts to buy local goods for the national currency. Cashless payments by bank cards stimulate the process of returning the money supply to non-cash accounts.

As the experience of devaluation shows, the functioning of the global financial system depends primarily on the conduct of monetary policy pursued in the interests of the economy of a particular state.

The reasons for the devaluation in countries that depend on the cost of raw materials produced, and in countries where the economy is focused on the production of goods and their implementation in foreign markets, are different. In the first case, this is the execution of the budget, and in the second - the protection of domestic producers. The decision of the People's Bank of China to devalue the national currency suggests that this method is resorted to when traditional levers of influence on the economy do not work. The devaluation of the Yuan allows us to talk about the beginning of currency wars between the major economic powers.

Devaluation becomes relevant in conditions of uneven inflation in an open market economy, that is, due to macroeconomic factors. The objectives and the level of devaluation are different in different countries. The level of national currency devaluation is influenced by gold reserves, the country's budget dependence on the cost of sold resources, economic diversification and other factors.

Abstract

The development of the higher education is one of the most important tasks of Economics. Modern tendencies of development put forward new demands, namely on the quality of education. Therefore, there is a need for a systematic study of higher education development priorities, directions and models of Ukraine and Azerbaijan. Among the issues discussed in this article is the renovation of the sphere of higher education in these countries, the transfer of attention from the learning process to the result, focus on a competent approach and the search for effective mechanisms for its implementation. The purpose of the article is the results of approbation of methods and models for assessing the quality of educational activities on the basis of a competent approach, which allow taking into account the mutual influence of the directions of activity of universities, as well as their influence on the results of studying students. The article presents the template of the model of competences taking into account the modular two-level organization of the higher education system. The methodology for evaluating the quality of educational activities is based on the competence approach. Among the methods that have been used are: system and competence approaches, BSC analysis and comparison, generalization, etc. The application of these methods of analysis enabled us to trace how the entire chain of causation in the form of a vertical vector is gradually reflected in all components of the BSC.

The main results of this study indicate that the quality of the organization of the university affects the level of competence of students. A BSC-analysis was conducted in eight directions of the university's activity, which allowed to reflect its strengths and weaknesses.

At the same time one can consider different variants of the change of activity and choose the one which will allow to form the highest level of competencies for students. Using a model to assess the quality of learning activities can predict the level of competence of students depending on the quality of the organization of the educational process, as well as identify areas of activity that need improvement and which can affect the formation. a certain level of competence.

Key words: education, system, models, evaluation.

Introduction.

The development of the economy in the sphere of higher education is one of the most important tasks of Economics. Crisis phenomena that accompany the formation of the domestic market economy, indicate the need to find ways and solutions to the problems of higher education development. Therefore, there is a need for a

systematic study of the theory of economic development, which is related to the need to determine the priorities, directions and models of higher education development in Ukraine. Modern tendencies of development put forward new demands, namely on the quality of education. One of the vectors for solving these issues is the renovation of the higher education sphere, the transfer of attention from the learning process to its outcome, focusing on a competence approach and the search for effective mechanisms for its implementation.

Purpose.

The paper examines the results of the approbation of mathematical methods and models for assessing the quality of educational activities on the basis of the competence approach, which allow taking into account the mutual influence of the directions of the university activities, as well as their influence on the results of students' studying, which allow taking into account the mutual influence of the directions of the university activities, as well as their influence on the results of students' studying.

Methods

Competence approach, mathematical methods and models, the method of assessing the quality of educational activity, neural network approach.

Findings

Considered methods and models for assessing the quality of educational activities on the basis of the competence approach allow taking into account the mutual influence of the directions of the university activities, as well as their influence on the results of students' studying. The model of a balanced map of indicators of higher education that includes the strategic goal - improving the quality of education, as well as eight options that describe the main directions of the university was proposed.

It is determined that the quality of the organization of the university affects the level of students' competencies. The conducted experiment showed that the application of the neural network approach will allow higher education institutions to predict the achievement of a given level of competencies, depending on the quality of organization in higher educational institutions. At the same time, it is possible to consider various variants of the change of activity and choose the one which will allow to form the highest level of competencies for students. The use of the model for assessing the quality of educational activities allows to predict the level of competencies of students, depending on the quality of the organization of the educational process, as well as identify areas of activity that need improvement and which can affect the formation of a given level of competencies.

Introduction. The study of economic development in the sphere of higher education is one of the most important tasks of Economics. The contradictory nature of the processes of economic development in Ukraine and the crisis phenomena that accompany the formation of the domestic market economy indicate the need to find ways and solve problems of the development of the higher education. The need for systematic study of the theory of economic development is connected with the necessity of determining the priorities, directions and models of the development of the higher education of Ukraine [5].

The main objective of higher education is to prepare a qualified specialist of the appropriate level and profile, competitive in the labor market, competent, the one who is fluent professionally and is familiar with related fields of activity, ready for permanent professional growth, professional mobility. One of the ways to address this is to renovate the sphere of higher education, shifting attention from the learning process to its outcome, focusing on a competence approach and the search for effective mechanisms for its implementation.

Within the Bologna process, European universities, differently and with varying degrees of enthusiasm are

mastering competent approach, which is seen as a kind of tool for strengthening the social interaction of the higher education with the world of work as a means of deepening their cooperation and recovery in the new conditions of mutual trust [6].

Ukraine began to focus on the competence approach within the development of standards for higher education of the second generation. It was then that an attempt was made to move from the existing system-activity approach to competence. However, the standards of the current generation do not use a competent approach.

Literature review. The theoretical and methodological basis consists of the works of domestic and foreign specialists in the sphere of the quality of assessment of students' knowledge of higher educational institutions on the basis of competence approach, assessment of activities, mathematical methods and models. In the work we use the principles, developed by foreign authors: T. Durand [5], R. Kaplan, D. Noton [9], P. Niven [4].

From the domestic authors these issues addressed V. Baidenko [2, 3], O. Zablotska [8], I. Zymnia [9], A. Kozlov [11], V. Luhovyi [12], etc.

The educational standards were based on the methods proposed in the TUNING project, launched in 2000 and actively supported financially and morally by the European Commission, and now the project covers the vast majority of countries that have signed the Bologna Declaration [16]. According to these recommendations, third-generation draft standards have been developed, in which the results of education are reflected differently from their predecessors: these standards have a loan-competent format.

Methodology and the aim of the article is the results of the approbation of mathematical methods and models for assessing the quality of educational activities on the basis of competence approach, which allow taking into account the mutual influence of the activity directions of the universities, as well as their influence on the results of students' studying.

The main results of the study. In order to promote the Bologna process in Ukraine, it is necessary to develop recommendations, in which the main place should be taken by the norm of quality of the result, which a competence orientation is able to give them. It is necessary to develop the main characteristics of the quality standards of the result, composition and levels, formed by students and graduates of relevant and perspective competencies (requirements for academic and professional preparedness of graduates). Educational standards in the outlined conceptual model will contribute to the development of the quality assurance system at the University, National and European levels. [1].

We should not simplify the implementation of a competent approach in the domestic high school to the level of borrowing of those implemented in European universities of universal and subject-specific competencies. It should be emphasized that only individual academic disciplines or even the content of the entire educational program can not be responsible for the formation of some competencies. Competencies are also a result of educational technologies, methods, forms organization, learning environment, and so on.

Fig. 1 presents a template of competence model which takes into account the modular two-level organization of the higher education system.

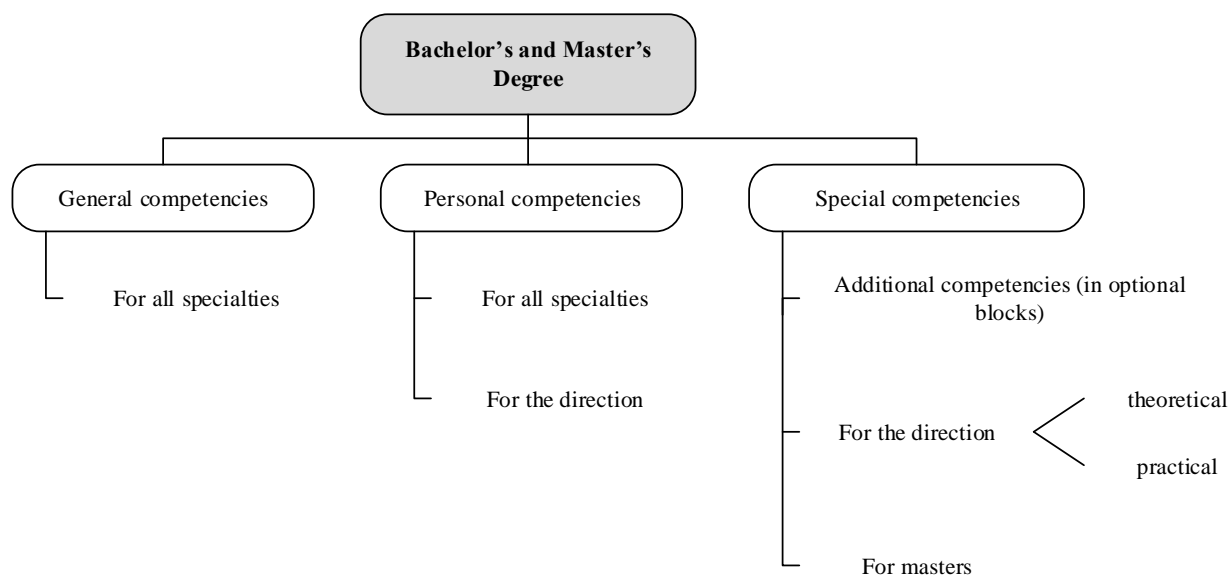

Fig. 1. Template of competency model.

The experience in creating projects of the state educational standards of higher education of a new generation testifies to the diversity of methodological approaches [6,7].

Two proposed classes of competencies will also be present in the proposed template, but their content will be slightly different. In the process of education, any student specifying in any fields receives two blocks of knowledge:

- the first one concerns general scientific approaches and methods, basic concepts and definitions;
- the second unit belongs directly to his specialty, and the knowledge and skills that he will receive will be developed by special competencies.

Consequently, in this template there will be general competencies that are characteristic of all areas of study, as well as special ones that relate to a particular direction.

In addition to these two classes, it is necessary to allocate another class of competencies - the personal. This class of competencies can be characterized as skills and rather it characterizes directly the student himself, but its self-development, as well as the composition depends on the subjects studied by the student.

Thus, the template of a competence model initially includes only general competencies and general personal competencies.

Indicators used in these procedures could become the source of a balanced system of indicators (BSC). BSC is something more than a simple set of key indicators or basic success factors. The multidimensional indicators in a properly constructed system should consist of interrelated goals and assessment criteria for their achievement, which are consistently complementary.

A balanced system of performance indicators is the interdependence of causal relations with the criteria for evaluating the results and the factors for achieving it. BSC developers have identified four components: finances, customers, internal processes, training and staff development. These components have been designed to meet the requirements of a wide variety of organizations and industries. However, these components are an example, not a

dogma. There is no such mathematical theorem that could prove that the four components of the BSC are necessary and sufficient; they «should be regarded as a template, not as a rigid scheme» [12].

It is clear that the components for a balanced system should be chosen, guided by the knowledge of the strategy. To select the components of the BSC it is necessary to determine the key components that will describe the strategy.

The four constituents are wide enough to cover most of the components [10]. However, it is possible that an organization receives a competitive advantage through relationships or processes based on another component. In this case, you can add a constituent to display this component. For example, the effectiveness of a university can largely depend on the quality of carrying out scientific work. Adding a constituent that reflects scientific activity will be of great significance for this organization.

Based on the findings of the BSC developers that the four constituents are merely an example, in the construction of a university activity assessment system, it is suggested that eight constituents be assigned to fig. 2.

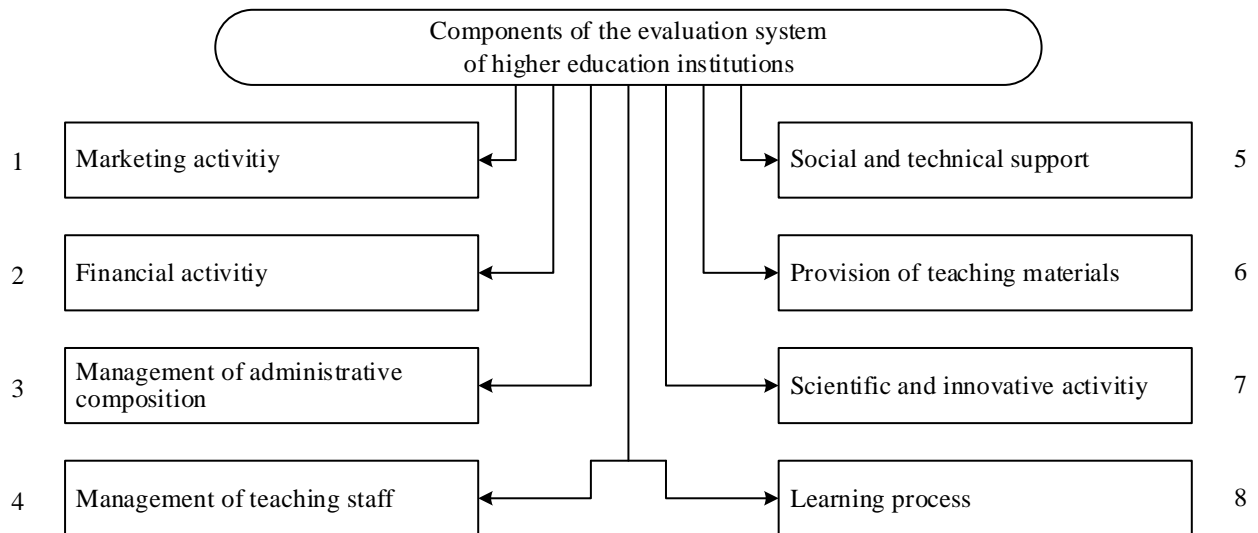

Fig. 2. Components of the evaluation system of the university activity

The purpose of the BSC is to assess the quality of the organization of the learning process. For successful students' training, it is necessary that the main directions of the higher education institutions function at an appropriate level of quality. So, these directions should be included in the BSC.

It should be borne in mind that the resource components should be located on the lower levels of the BSC. The BSC proposed by us will evaluate the availability of university in two directions:

1. «Social and technical provision» – takes into account the provision of students and teachers with social and technical goods (food, accommodation, etc.).
2. «Educational and methodological provision» – takes into account the availability of the literature in the university.

The last component below the «Learning Process» (see Fig. 2) refers to the development and assessment of the

scientific potential of the university. Without the development of science, the university is unlikely to be able to supply its students with new and relevant knowledge, and, consequently, the learning process should be based on the results obtained in the implementation of scientific research, experiments and projects. The top of the model is a component, the assessment of which will reflect the level and quality of the organization of the educational process in universities.

The chain of causation, being the main element in the construction of the BSC, runs through all the components of this system [13]. Thus, it is possible to trace how the whole chain of causation in the form of a vertical vector is gradually reflected in all components of the BSC (see Fig. 2).

Two models can be used to assess the quality of education in HEIs:

1. Competence model - to assess the quality of graduates knowledge.
2. Balanced Scorecard (BSC) – to assess the quality of the educational process organization.

Assessing the quality of education on the basis of these models will give a certain result, but it will not be objective due to the fact that these models are used separately, without any binding to each other.

The competency model and the model of the activities of higher educational institutions, described with the help of a balanced scorecard, affect each other and can not be considered separately.

Combining balanced scorecards and a competency model by establishing a link between a specific purpose of the BSC and a specific competence is a very difficult task since an individual goal has an impact on the competency model as a whole, rather than on its individual elements. Combining models with this method will not fully reflect the impact of the quality of the organization's areas of activity on the quality of student knowledge, expressed as a set of competencies.

However, the relationship between these models can be set at the level of BSC options and competency groups(Figure3).

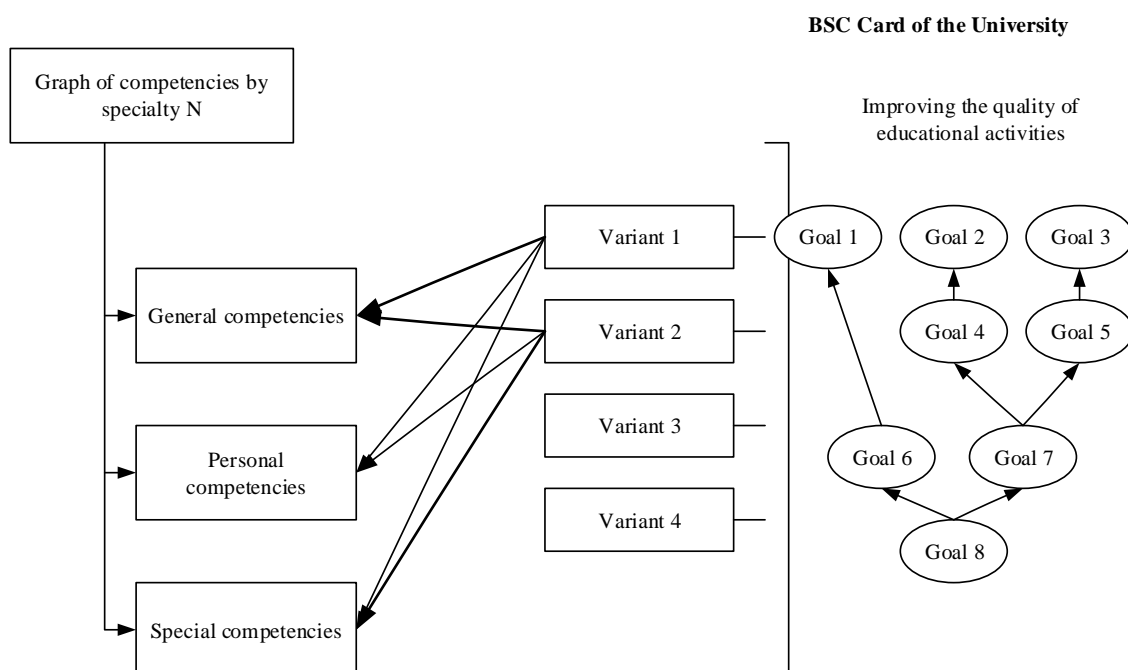

Fig. 3. Interconnection of BSC card and competency model of student.

In order to bind the BSC and the competency model, it is necessary to form some kind of mathematical relationship between the groups of competences and the BSC variants, which will allow determining the competence values depending on the contents of the options for the composition of the BSC. Detection of such a dependency is a non-trivial task, because each indicator varies in different ways on the competence of students, and therefore the dependence will be described by different functions. Theoretically, it is possible to find an averaged function, which to some extent will be suitable for each particular variant, but again it will have a high degree of inaccuracy.

Determining the relationship between the series of values of competencies and variants of the BSC card is possible only through the use of a neural network approach that works on the principle of biological neural networks – networks of nerve cells of a living organism.

The final value of the degree of implementation of the component was calculated as the sum of the stages values of the goals:

$$x_l = \sum_{j=1}^m c_{jl}$$

In order to validate the model of education quality assessment, its testing was carried out on the basis of the National Academy of Management.

The conducted experiment confirmed that the use of a developed model for assessing the quality of education based on BSC and a competent approach will allow predicting the level of students' competencies, depending on the quality of the organization of the educational process.

Results, Conclusions and Recommendations

A mathematical model for assessing the quality of educational activity in higher educational institutions, that is centered on the neural network which is based on the logistic function, is developed. The proposed model of a balanced map of indicators of higher education includes one strategic goal – improving the quality of education, as well as eight options that describe the main directions of the university. The proposed BSC card template is not a standard and may vary depending on the size, purpose and direction of the university.

The developed questionnaire allowed to assess the level of competence of graduates.

Each of the elements of the developed model: the competence tree and the BSC card provide an opportunity to evaluate and identify improvements in the quality of education in higher education institutions.

The BSC map allows to monitor the main directions of the University's activities by setting goals and indicators that reflect the performance of each direction. Applying this model, one can identify a set of directions, where the state of the goals that determine this direction do not meet the norm. The unsatisfactory state of any purpose implies the need to adjust the activity controlled by this goal as well as the purposes that underlie the desired goal. For example, when testing the developed model with the help of the BSC card, it was discovered that the goal «Increase the level of projects implemented by graduates», which is part of the «Educational process» direction, is lower than the norm. Therefore, it is necessary to pay attention to the preparation of students who will graduate, namely – the provision of students with materials for writing master's thesis, the quality of organizing events in the framework of preparation for protection, the quality of advice of scientific managers. In addition, the goal «Increasing the level of projects implemented by graduates» is based on the goal «Provision of students with laboratory equipment», and therefore the leadership of the university needs either to upgrade

laboratory equipment or to make it current or major repairs.

It was noted that the quality of the university organization affects the level of competence of students. Therefore, the elimination of problems in the organization of activities should lead to an increase in the quality of competencies. If an expert on the quality of higher education in the analysis of the student's competence tree finds the inconsistency of the norm of certain values of competencies, while all the directions of the BSC card are in line with the norm, then he needs to pay attention to the quality of the content or the quality of teaching subjects that develop this competence.

The conducted experiment showed that the application of the neural network approach will allow higher education institutions to predict the achievement of a given level of competence, depending on the quality of organization of activities in higher educational institutions.

Applying the neural network approach, the university has the ability to predict the level of competency values that students will receive in case of changes to certain areas of higher education. At the same time, it is possible to consider various variants of the change of activity and choose the one which will allow to form the highest level of competencies for students.

The use of the model for assessing the quality of educational activities can predict the level of competence of students, depending on the quality of the organization of the educational process, as well as identify areas of activity that need improvement and which can affect the formation of a given level of competence.

Tourism Education in Azerbaijan: Current Situation, Problems And Solutions

Gadir BAYRAMLI

Azerbaijan State University of Economics (UNEC); Email: kadirbayramli@gmail.com

Abstract

Tourism has been chosen as one of the priority areas among non-oil sectors. Although there are prerequisites for the development of tourism in a country with rich natural and historical-cultural recreation resources, the use of country's rich tourism potential is not sufficient. One of the reasons why tourism cannot achieve any result is the problems of tourism education. This problem is also delaying the transition to sustainable development of tourism. These reasons make it necessary to carry out research on tourism education, identify and solve problems.

Some issues related to tourism education have been touched upon in the Strategic Roadmap for Tourism Development, tourism related programs and some tourism textbooks, and highlighted the importance of solving the problem. Almost all tourism education institutions and most of the qualified cadres in tourism are concentrated in the capital Baku and other major cities. This indicates that there is an inequality in the location of skilled cadres in the field of tourism, and according to these figures the regions are far behind the major cities like Baku, Ganja and Sumgayit. Investigation of tourism education requires a comprehensive and systematic analysis.

Statistical analysis, comparative analysis and SWOT analysis methods have been used in this article, which examines the problems of tourism education in Azerbaijan.

If problems on tourism education are solved, it will be possible to make better use of the country's recreational potential and improve the quality of tourism services. The problem of tourism education is to increase the number of enterprises providing tourist education, to study and apply the experience of developed countries, to strengthen the staff in the tourism education institutions, to introduce innovative methods of teaching, to improve the quality of textbooks, to enhance tourism education in the regions, and to provide internship opportunities for students and young researchers to meet their needs.

Key words: Tourism education, innovative methods, effective use, staff, internship opportunities.

Introduction

Tourism having a special place in the non-oil sector is developing fast during the last years. Infrastructure in the tourism destinations is strengthening and the number of foreign tourists is increasing. All this requires to increase the number and quality of specialised personnel for tourism sector. And strengthening the cadre is possible by tourism education meeting the modern requirements. Despite not any special program of tourism education was prepared in Azerbaijan, the tourism education was shown as one of the priorities in the Strategic Roadmap and other State Programs and increasing of investment in this field was overseen. There is a need for detailed investigation of tourism education for development of this sector.

Because of small number of statistical data of tourism education and broadcasting on the topic, the preference has been given to information from Internet. This article aims to partially remedy deficiency in the field of tourism education in Azerbaijan.

Methods

The methods of statistical analysis, comparative analysis and SWOT analysis methods have been used in this article. Because of that there are not any detailed data of tourism education in Azerbaijan in the reports of the State Statistical Department, State Tourism Agency and other state bodies, it has been forced to use incoherent information placed in Internet. When using comparative analysis method, such countries as Turkey and Russia, having the similar economic and social status and peculiarities of development of tourism as well as having close tourism relations with Azerbaijan have been chosen. By SWOT analysis the strong and weak sides of tourism education in the country as well as opportunities and threats have been pointed out.

Tourism education and its significance

Tourism education means such activities as to impart tourism consciousness (concept) to students, teach basic principles of hospitality, improve general and professional knowledge of personnel working in the tourism industry, grow managers, research specialists and technical workers for this industry. The aims of tourism education are to impart tourism consciousness (concept) to people, to increase productivity in tourism sector, to give professional knowledge and behaviour to personnel rendering service to tourists, to teach future workers to provide balance among authority, capacity and responsibility (Mavis, Kozak:1992:169).

Tourism education opens up wide opportunities for saving cultural and historical heritage, thereby saves not only monuments as material objects but also language, customs, folklore and many other ethnocultural components. Professional tourism education moulds a specialist who is responsible for the holistic and constructive development of the whole tourism movement (Fedulin, 2008:71).

Tourism education is necessary for coping with a strong and dynamic marketing conception, getting support from lobbies for favor of the country, forming public opinion, establishing public relations and solving complex problems caused by marketing.

Professional and qualification structure of the personnel of tourism is permanently improving since dynamic changes of consumer demand and social and economic conditions of tourism business require proper corrections. At the same time the existing practice of preparation of personnel of a country has to be permanently harmonized with the world practice and standards. For effective production activity the content of preparation of tourism personnel should be defined by qualification testimonial representing science-based set of professional abilities and skills officially fixed in qualification requirements at state level.

Principles of educational conditions and models of formation of highly skilled specialists – tourism activity leaders at vocational guidance level through the first level of professional education (colleges), tourism type of higher schools and graduate schools in conditions of Azerbaijan deserve consideration.

Tourism education should be approached to not only as preparation of personnel but also as educating investors and leaders, tradesmen, managers of both public and private sectors and on the whole the people.

Comparative analysis of tourism education in Azerbaijan

Tourism education is provided in about 10 universities and 2 specialized colleges. Baku State University (BSU) started tourism education in 1980 as the first step. The main scientific direction of the Department of Economic and Social Geography of Foreign Countries and Tourism of the Faculty of Geography of BSU is Development Perspectives and Regional Problems of Tourism in Azerbaijan. The Department has relations with Balikesir University and Chanakkala University and Turksoy Centre in Ankara (Baku State University, <http://bsu.edu.az>, 2019).

This university is the first higher school starting tourism research. At present, the university prepares personnel on Tourism and Hoteling specialization. Some students have internship in foreign countries (USA, Turkey, Cyprus) during summer.

An only university specialized in Tourism Education in Azerbaijan is Azerbaijan University of Tourism and Management which was established in 2006. 3 faculties and 9 academic departments specialized on different fields of tourism are acting in the university. Students specialized in Tourism and Hoteling have their internship not only in Azerbaijan but in other countries, too. Students can individually apply for this practice and use

chances coming from cooperation of the university with foreign hotel and tourism companies located in Kazakhstan, Germany, Malta, Daghestan, Israel, Greece, Russia, Spain, Turkey, Czech Republic, USA, Northern Cyprus, the Ukraine, UAE, and Seychelles Islands. An agreement on double degree program was signed between Azerbaijan University of Tourism and Management and Krems University of Austria (Azerbaijan University of Tourism and Management, <http://atsmu.edu.az>, 2019).

After gaining independence of Azerbaijan in 1991, tourism sections have been opened in public and private universities and now these sections are acting in about 10 universities.

Tourism sections are acting in Turkish World of Economics Faculty of Azerbaijan State University of Economics and its Zaqatala branch having highly qualified specialists and infrastructure for tourism education. Tourism section students have opportunities to have internship in various tourism enterprises. Besides these universities, tourism sections are acting in Azerbaijan Cooperation University, Ganja State University, Mingachevir State University, Lenkaran State University, Western Caspian University and Sumgayit State University. Majority of sections providing tourism education are located in Baku. These universities have a wider personnel and infrastructure, when material and technical basis and personnel of regional universities are weaker and they have less specializations.

Besides universities, two colleges providing tourism education (Baku Physical Education and Tourism College and Mingachevir Tourism College) are acting. In Mingachevir Tourism College prepares various specialists and 4 of them are directly connected with tourism (Mingachevir College of Tourism, <https://mtk.az>, 2019). Majority of institutions providing tourism education in Azerbaijan started to act during last 20 years and their alumni satisfy demands on tourism personnel only partly. In the Strategic Roadmap for Tourism Development it was shown that only 10% of workers acting in the tourism sector are tourism specialists (Strategic Roadmap for the Development of Tourism Industry in the Republic of Azerbaijan, 2016:75). The number of workers acting in the tourism sector in 2018 was 53222 people (Statistical Yearbook of the State Statistical Committee of the Republic of Azerbaijan, 2019:19). When comparing Azerbaijan with countries having tourism relations with it (Turkey and Russia) we can observe that the number of tourism education schools and specialities provided, is much less than in those countries. 40 tourism faculties and 14 tourism management and hoteling institutions were acting in Turkey in 2018. Besides, there are 12 tourism management sections in Economics and Organization of Business faculties of universities (Keles, 2018:220). Widening of tourism education net caused the increase of ratio of people working in tourism sector. So 2,000,218 people were working at tourism sector in Turkey in 2016 which was 8% of all working people (Şit, 2016:101).

It is planned for 2023 to increase the number of workplaces at tourism sector for 80% in comparison with 2013 (Çelik, <https://www.turizmgunlugu.com>, 2017).

There is a tourism net in Turkey bringing together universities, vocational schools and colleges and they play significant role in preparation of the personnel. Transformation of 200 vocational schools to colleges should be realised during the next 5 years (<https://www.ntv.com.tr>, 2019).

Despite the big number of tourism education schools, many researchers are pointing out the existence of some serious problems in tourism education field in Turkey. The main problems are shortages in the policy and planning of tourism education, weak coordination between the tourism sector and schools providing tourism education, deficiency of integration in tourism education, lack of legal protection of educated tourism specialists and insufficient level of foreign languages (Olçay, 2018:385).

In Russia having close tourism relations with Azerbaijan, until 1990 there were not any higher education schools providing tourism education. 286 higher education schools providing tourism education have been registered in 2018 in Russia which made progress in the field of tourism education during independence. In Russia feeling deficiency in tourism personnel meeting international standards the main problem in tourism education is provision of mainly theoretical knowledge to students and low level of practical skills of alumni [- Trusova, Trusov, 2015:179]. As a result of tourism reforms and some advancements in the field of tourism education it became possible to raise the share of tourism sector in economy to 3.47% or 3 trillion roubles in 2017 (<https://www.interfax.ru>, 2018).

4.5% of able-bodied population worked in tourism sector in Russia in 2017 and rising of this indicator to 5.9% is prognosticated in 2028 (<http://www.atorus.ru>, 2019). The researchers are pointing out that absolut majority of people working in tourism sector in Russia do not have professional tourism education.

According to data of experts, about 80 percent of the present collaborators of domestic tourist firms do not have the relevant education (Radkov, <https://akvobr.ru>).

Existence of similiar problems in the field of tourism both in Azerbaijan and in the selected for comparision countries (Turkey and Russia) is being observed. In all three countries the main problems are difficulties in length of service and smallness of practical knowledge of alumni, insufficient level of foreign languages, weak coordination between the tourism sector and schools providing tourism education. Absence of solution of tourism education problems is among the reasons why the rich tourism potential is weakly used in all three countries.

Efforts for development of tourism education in Azerbaijan

Holding of some international events (Eurovision 2012 -Song Contest, the First European Games, the Fourth Islamic Solidarity Games, Formula 1 Grand Prix, UEFA Europa League final etc.) during the last 10 years not only raised the prestige of the country, it also demonstrated how preparation of tourism personnel is important. Declaration of tourism as one of priority fields in the non-oil sector requires development of tourism education. Tourism education is especially mentioned in the state programs of the country connected with tourism. One of the activity directions of the State Program on Development of Tourism in Azerbaijan Republic in 2010-2014 adopted in 2010 was "Improvement of personnel preparation and refresher training system, realisation of projects on education abroad" (State Program on Tourism Development in the Republic of Azerbaijan for 2010-2014, 2010:64)..

"The Strategic Roadmap for Tourism Industry Development" can be evaluated as the most important stage in tourism education development. The fourth strategic goal of this document ratified on December 6, 2016 is "creation of national tourism quality system for increasing pleasure of tourists". The following measures for development of tourism education were planned in "the Strategic Roadmap":

- Creation of a working group for coordination of tourism education and training programs;
- Creation of regional vocational schools of tourism within Azerbaijan University of Tourism and Management;
- Preparation of profession standards and curricula on tourism sector and taking measures for certification of tourism guides;
- Organizing educational seminars for representatives of sectors connected with tourism;
- Taking measures for MBA programs on Tourism (Strategic Roadmap, 2016:76-77).

Strengthening professional tourism education is one of the main conditions for complete realization of reforms conducted in this field. Despite this priority will not directly influence on the sector, but will help increase the

real GDP of Azerbaijan. Successful implementation of the Strategic Roadmap will be helpful for creation of new working places in education field and increasing interest of young people in tourism specialization. Taking into consideration the development tendency of world tourism, features of tourism development in the country, development of new destinations and kinds of tourism, there is a need for preparation of “The Strategy of Tourism Education Development”.

Creation of the State Tourism Agency in the country in 2018 can be evaluated as continuation of structure reforms. Realization of the tasks of Agency (improvement of research and statistics for a longer development, preparation of relevant state programs and development concepts, marketing for defining the main tourism markets, taking propaganda measures for involvement of tourists from suitable countries and regions, preparation and realization of marketing and communication plans of regions and cities, development of tourism education, the maximum use of opportunities of innovations and modern technologies in tourism, widening state-private business cooperation etc.) is possible only by tourism education meeting the developed modern requirements (State Tourism Agency of the Republic of Azerbaijan, 2019)

Main peculiarities of tourism education in Azerbaijan

The system of tourism education of Azerbaijan is similar to the system of developing and post-soviet countries. The peculiarities of tourism education in Azerbaijan belonging to the group of developing states because of the level of development can be generalized as following:

- Tourism education is a new phenomenon for Azerbaijan. With small exceptions, tourism education started in the period of independence.
- Ecological and tourism consciousness is not inculcated before the university education.
- Tourism education schools are mainly concentrated in big cities and tourism education in the regions is limited.
- The number of specializations in universities providing tourism education is small.
- The system of tourism education of Azerbaijan is similar to the system of post-soviet countries.
- There is not any systematic approach in Azerbaijani tourism education.
- Frequent structural changes are observed in the schools providing tourism education.

Problems of tourism education in Azerbaijan

There has been no significant progress in the field of tourism education in Azerbaijan during the Soviet period which ended in 1991. Changes in tourism education in Azerbaijan became possible after the country gained independence in 1991. In the first years of independence, tourism departments were opened at various universities, and in 2006, the University of Tourism was established. Despite some work in the field of tourism education, only 10% of the country's tourism sector is qualified. The shortage of personnel in the tourism sector also hinders the sustainable development of tourism, making it difficult to fully utilize the tourism potential. At the same time, due to the shortage of professional staff, it is not possible to effectively carry out activities in the field of planning, marketing and promotion in tourism.

Most of Azerbaijan's tourism education facilities are located in Baku. The number of tourism education establishments and specialties in the regions is low. Armenian occupation of 20% of Azerbaijani territory has made it impossible to establish tourism education facilities in the unique destinations of Nagorno-Karabakh and its surroundings.

Lack of professional staff and quality textbooks in tourism education institutions in Azerbaijan has a negative impact on the development of tourism education. At the same time, there is a discrepancy between the curriculum in tourism education institutions.

Inadequate understanding of tourism in higher education can be seen as an important disadvantage in tourism education.

In the Strategic Roadmap for Tourism Development, the number of graduates from tourism specialty are very low in Azerbaijan, despite the growing popularity of tourism among young people, it is not yet sufficiently prioritized by students because of its seasonal character. At the same time, it was noted that the material and technical base available in higher, secondary special and primary vocational schools in Azerbaijan does not meet international standards and students are being taught more theoretical knowledge. All these factors make it necessary to hold reforms in tourism education and to study the experience of advanced tourism countries, and to take into account the social and economic conditions in Azerbaijan.

SWOT analysis on tourism education in Azerbaijan

Analysis of tourism education in Azerbaijan has allowed to summarize both its strengths and weaknesses, as well as opportunities and threats. The results of the author's SWOT analysis are given below.

Table 1. SWOT analysis of tourism education in Azerbaijan

Advantages	Weaknesses
<ol style="list-style-type: none"> 1. Availability of tourism education university, tourism departments at several universities and colleges 2. Certain experience in tourism education 3. Availability of a certain number of personnel studying abroad in the field of tourism 4. To highlight the need to improve the quality of tourism education and conduct tourism research in government tourism programs. 5. Providing certain internship opportunities for students studying tourism 6. Availability of masters and doctoral education in some universities of the country in the field of tourism education 	<ol style="list-style-type: none"> 1. Lack of understanding of tourism in lyceums and secondary schools 2. Fewer universities and colleges providing tourism education 3. The fact that tourism education facilities are mainly located in the capital Baku and there are few tourism education facilities in the regions. 4. Lack of specialties in tourism education institutions 5. Lack of highly qualified tourism personnel in universities 6. Lack of quality textbooks 7. Limited opportunities for students studying in tourism to study abroad 8. Poor cooperation between tourism companies and universities.
<p>Opportunities</p> <ol style="list-style-type: none"> 1. Transformation of Azerbaijani high schools with great potential (UNEC, Baku State University and Khazar University) into tourism education centers of the region 2. Sending Azerbaijani tourism graduates to gain master's and doctoral education to Turkish universities where language problems are not experienced. 3. Organization of teacher and student exchanges with Tourism Universities in Turkey, Russia, Ukraine, Kazakhstan. 4. To provide internship in prestigious scientific centers of the world cooperating with Azerbaijani universities. 5. Creation of a personnel bank for the tourism sector. Increasing the tourism quota in the list of students sent abroad through the Ministry of Education of Azerbaijan. 6. Active participation in the educational projects of the World Tourism Organization, UNESCO and other 	<p>Threats</p> <ol style="list-style-type: none"> 1. Occupation of tourism areas of Azerbaijan, such as Shusha, Khankendi and Kalbajar and failure to establish tourism education facilities 2. The problem of finding employment for graduates of tourism department 3. Redirecting recipients of tourism education to other areas 4. The influx of graduates from tourism departments to foreign countries 5. Non coming back students studying tourism abroad

international organizations.

7. Use the North-South and East-West transport corridors to expand tourism links

Results, Conclusions and Recommendations

Rapid development of tourism in Azerbaijan requires improvement of tourism education. In order to solve the problems related to tourism education in the country, we consider it expedient to implement the following measures.

Inclusion of tourism related sections to the books "Geography and Life Knowledge" taught in high school in order to increase the understanding of tourism (consciousness) at an early age

- Organization of Tourism Olympiads in the country
- Organization of Young Tourists Clubs in secondary schools and colleges;
- Strengthening the material and technical base of universities and colleges providing tourism education
- Establishing network of vocational schools providing tourism education
- Sending employees in tourism education institutions to the leading tourism education universities of the world for research and internship purpose and to tourism companies providing internship opportunity. leaders in the world's leading tourism education universities and internship tourism companies.
- Implementation of "Tourism-oriented Secondary School → Vocational Schools → Colleges → University" scheme in tourism education system
- Creation of jobs in the tourism sector for women and youth.
- Resolving the insurance problem of the tourism sector.
- Definition of professional standards in tourism.
- Establishment of cooperation between the tourism sector and tourism education institutions.
- Implementation of effective planning of tourism education.
- Development of joint internship programs by tourism companies and companies.
- Strengthening foreign language teaching in tourism education institutions
- Opening of tourism guide courses by professional teachers.
- The use of Turkey's Anatolian Tourism Specialist internships

Azerbaijan needs to expand its rapidly developing tourism sector and increase investment in this area. The provision of the tourism sector with qualified personnel depends on the quality of education. For the comprehensive development of tourism education in Azerbaijan, it is necessary to develop and implement the "Tourism Education Strategy" based on the priorities outlined in the Strategic Roadmap.

The three-tiered tourism education system could be more useful for Azerbaijan. If this system is implemented, it will be possible for the tourism sector to train all personnel from technical staff to managers.

Qualitative tourism education is of particular importance in terms of optimizing the environmental impact of tourism and sustainable development of tourism. Effective use of Azerbaijan's rich tourism potential will depend on the development of tourism education in the country.

Inclusive Education is the Basis for Universalizing of Higher Education

Sevinj MAHSIMOVA

*Coordinator of Inclusive education center of Azerbaijan State University of Economics (UNEC)
AZ1001, Istiqlaliyyat str., 6, Baku, Azerbaijan
Email: sevinc.mehsimova@gmail.com*

Abstract

For many years, the focus of scientific and pedagogical research has been on finding effective strategies for the theory of inclusion, which contributes to the achievement of the main goal of inclusive education - the creation of a truly humanistic society based on inclusive culture. Currently, the most relevant is the development of inclusive higher education as a science - research and practical direction.

The principles of universal learning design allow you to create the conditions for the actual introduction of students with a variety of educational needs into the process. The use of the system of universal learning design allows to solve many problems of the transition period, to pay attention to the peculiarities of students' personality development. Universal design in education improves the development of inclusive forms of education and professional competence of teachers.

Keywords: Universalization in high education, Inclusive education in Azerbaijan, Inclusive high education, Universal design in learning, Innovations in high education

Introduction

“Pedagogy should focus not on yesterday’s, but on the future of human development,” stated L.S.Vygotsky, one of the founders of modern pedagogical science.

Enhancing higher education and improving the efficiency of the educational process is associated with a global approach to education, with the internationalization of education. “Global education” reflects the emergence of new approaches to understanding the integrity of the world and the actualization of those subject areas that reflect the sustainability of social development, the importance of international understanding and peace, the rights of every person, of democracy and cultural diversity.

Global education is related with the reflection in the educational process of the trends of universalization lifestyle and the strengthening of the regional development; the organizational forms are of great importance themselves, that they allow improving educational practice. Radical changes in the cultural, social, economic and political spheres of society in many countries led to the formation and development of inclusive education. These changes cause undoubted modifications in ideology of society and in relation to people with disabilities.

Exploring foreign literature on the formation and development of inclusive education could be divided into several stages, beginning from complete denial (up to the XVIII century) then insensibly integration of people with disabilities and socially disadvantaged into society (from the XVIII century to the beginning of the twentieth century).

1. The first steps of universalization in educational systems.

L.S. Vygotsky, J.Karger & C.Hitchcock and others researchers of pedagogical science state, in the first decades of the XIX century, the problem of co-education not only occupied the minds of progressive teachers, but also in a number of cases was successfully tested in the folk schools in some European countries. European inclusive pedagogy begins in the XIX century with the pedagogical ideas of J.Pestalozzi - about the need and possibility of

teaching all children and preparing them for future work activities, about diversified development in accordance with their nature and needs, about the importance of teaching for children with mental retardation, physically and socially disadvantaged. (Karger, 2004) (Kukuev, 2010) (Vygotsky, 1983)

After more than a hundred years, European education will rediscover educational integration for itself and find a new ways to solve the related problems. In the 40s of XX century begins the most progressive stage of the development of inclusive society and education. The period of the Second World War and the following years forced the society to reconsider its attitude to the value of human life. The economic, technological and informational capabilities of the European developed countries and the USA allowed establishing all conditions for the implementation of inclusive education, with the existing system of special education.

In Europe, integration begins to implement mainly in a legislative and practical way. The Declaration adopted by the Salamanca Conference (UNESCO held the World Conference on Education for Persons with Disabilities) calls for understanding of the inclusive education content and the introduction of this concept into pedagogical terminology, contributing to the improvement of national education systems, integrating special and general education systems in inclusive context. (Convention, 2006) (Declaration, 2006)

From this time begins the period of experimental search in the field of inclusive education, which is characterized by increased integration processes in education, a significant contribution to the promotion of them made progressive-minded foreign teachers and representatives of public organizations. The development of inclusive education as a research and practical direction has become relevant for the post-Soviet countries. The education provided for people with disabilities in Soviet society was implemented by isolation in special educational institutions (boarding schools, special schools), etc.

2. Inclusive education in post-Soviet countries

Only from the late 80s of the twentieth century the concept of inclusive society and inclusive education began to expand. The first inclusive educational institutions in Russia appeared at the turn of the 1980s – 1990s, but then inclusive schools operated without appropriate systems. At that time there was practically absence of legislation, the level of accessibility of the educational environment was extremely low. In Russia, the systemic implementation of inclusive education, enshrined in legislative acts, is occurring at a very slow rate. In the overwhelming majority of cases, the initiative in promoting integration ideas belonged to representatives of public organizations and parent associations.

Interesting is also the experience of Belarus, which started in the integration process contemporaneously with Russia in the late 80s of the twentieth century, achieved good success and continues to develop. In Ukraine, a differentiated system of special education began to establish in the middle of the 20th century.

The development of integration processes in post-Soviet countries was influent by the recognition of new values of education as a social system that creates conditions for human development and society. Nevertheless, one of the most acute problems in post-Soviet education is the weak system of implementing inclusive environment for young people with disabilities. Therefore, it is timely and important to study and analyze the inclusive education in detail, to consider its implementation taking into account the specifics of the national context. (Kukuev, 2010) (Luchkov, 1981)

3. Measures taken by the State for the development of inclusive education in Azerbaijan

Since the 90s of the twentieth century changes in the same area began in the education system of Azerbaijan. Some educational institutions of the country began working in the mode of integration (the creation of special

classes for children with developmental disabilities). Here it should be noted that during this period there was extremely increasing in the number of children with disabilities and orphans among refugees from the occupied territories of Nagorno-Karabakh and adjacent areas.

The educational reforms carried out in recent years in the Republic of Azerbaijan have made it possible to achieve significant success in inclusive education field. In the late 90s of the twentieth century started by National leader Heydar Aliyev changes in inclusive education development continue to improve and expand through various laws and programs by the leadership of Azerbaijan. Heydar Aliyev Foundation has made an invaluable contribution to implementation of these programs. The Foundation has conducted a whole range of measures to strengthen the material and technical and educational base for educational institutions and youth with disabilities.

It should be noted adopted by the Decree of the President of Azerbaijan Ilham Aliyev of December 14, 2017, “The State Program for the Development of Inclusive Education for Persons with Disabilities in the Azerbaijan Republic for 2018-2024”. This Program indicates specific ways to improve and conceptual development of inclusive education in the country, such as: improving regulatory legislation to provide inclusive education for persons with disabilities at all levels of education; training of teachers and their involvement in additional education; creation of a database of people with disabilities related to inclusive education, etc. (State program on the development of inclusive education for people with disabilities in the Republic of Azerbaijan in 2018-2024 , December 14, 2017) (State Strategy for the Development of Education in the Republic of Azerbaijan , October 24, 2013)

The result of the successful implementation of these programs is today's educational policy in our country. Sustainable development is observed at all levels of the educational system. Special attention is attracted by the continuous improvement and high level of education in universities, for which inclusion remains one of the priority directions of development. Here we can proudly mention the development of higher inclusive education at Azerbaijan State University of Economics (UNEC). UNEC has been studying for young people with disabilities for many years. Previously, for students who did not have the opportunity to attend university (for health reasons or because of inaccessible infrastructure), classes were held remotely. Nevertheless, in recent years, UNEC has been implementing a full-fledged including young people with disabilities into educational process.

In February 2018, at UNEC was organized an international conference: “Inclusive Higher Education: International Trends and UNEC Experience”. After the conference, was arranged specialized training for university teaching staff in all areas of inclusive education. Leading experts from Azerbaijan, Russia, Turkey, Dubai, Ireland and Germany conducted the training.

Several important factors contribute to the successful implementation of inclusive education in educational institutions of the country. The first is the professional and personal readiness of teachers to implement the process of full inclusion. This process requires urgent improvement. Currently, within the framework of state projects and programs, the Ministry of Education of Azerbaijan has taken a number of measures to organize advanced training courses for secondary school teachers in inclusive area, various thematic trainings, and mandatory courses for leaders of inclusive educational institutions.

4. New concepts for universalization of inclusive education in world experience

The implementation of all these measures raised the level of professionalism of teachers of schools and universities in inclusion framework. Still teachers in inclusive groups are considered as special educators. There is still a difference between a teacher of common groups and a teacher of inclusive groups. It is important to note

that for a full-fledged inclusive education, especially higher education, there should be no difference in the teaching systems, and all teachers should be equally prepared for universal classes, the system of education should be universal.

Some foreign scientists researching (A.Meyer, D.Rose & D.Gordon; H. Macdonald & R.Teed, and others) point about the creation of a universal theoretical model for ensuring inclusion in an educational institution. According to their observations, the process of implementing inclusive education should be based on the flexibility of pedagogy in relation to all students. At the same time, the results of many years of research prove that it is impossible to create a unified model of inclusive education. However, it is important to understand the need to change educational methodologies. Pedagogical research confirms the need to adopt the flexibility of curriculum and teaching methods because of the diverse needs of students. (Billingsley, 1991) (Boone, 2005) (Cole, 2005) (McDonald) (Meyer, 2014)

It should be emphasized, that the improvement of the education system, the improvement of pedagogical science leads to the universality of the education system as a whole. In early 1990s, the American specialists of the Center for Applied Technologies (CAST) drew attention to the fact that the concept of universal design of R. Mace is applicable to the field of education. The term “universal design” is proposed by the architect Ronald Mace as the definition of approaches to the design of any products and environment from the standpoint of aesthetics and affordable use by all, regardless of age, ability or status (Meyer, 2014) (Rose, 2002)

Using the elements of flexibility, inclusiveness and foresight of people's needs, as well as advanced scientific achievements, CAST specialists created a concept and technology of universal design for teaching Universal Design for Learning, which encourages educators to look for universal tools for students with different abilities.

The concept of "universal design" only enters the environment of education in our country. It is still accepted as an architectural term, i.e. accepted as “accessible environment”, “accessible infrastructure”. In 2006, after ratification the UN Convention on the Rights of Persons with Disabilities, the Republic of Azerbaijan accepted an international obligation to ensure the observance of the principles of universal design in the surrounding area, in the service sector, including education. The term “universal design” means the design of objects, furnishings, programs and services, designed to make them as suitable as possible for all people without the need for adaptation or special design. (Convention, 2006) (Declaration, 2006)

The principles of universal learning design allow creating the conditions for the actual introduction of students with a various educational needs into the process. For students with special needs, he provides the necessary ongoing support in the process of adoption the general curriculum: not only support by specialists in individual classes, but also every day, in each lesson, each teacher - due to the flexibility and universality of the curriculum. (Billingsley, 1991) (Boone, 2005) (McDonald)

Analyzing the research of many scientists, we can formulate a universal learning design as a “pedagogical design”. As a scientific discipline, the universal “Pedagogical Design” (Instructional Design), is engaged in the development of the most effective, rational and comfortable tactics, methods and systems of education. Discipline is extensive and is based on the following principles:

- 1) “Presentation” - development of training materials (instructional design), multifarious ways of presenting information and knowledge provide students various ways of obtaining them, the opportunity to choose.
- 2) “Demonstration” - development of the learning process itself, providing students the opportunities to choose different variants of expression and demonstrate what they know, (learning design).

3) “Participation” - development of an educational (training) environment, various ways of attracting attention, stimulating students' interest, and increasing motivation (environment design).

To support teachers prepare flexible curricula that meet the needs of all students, CAST has developed the Universal Design of Learning principles and technology. It should be noted, that the “Guide to Universal Design in Education” states that universal design of education is based on the achievements of cognitive science, on the laws of the brain. As you know, different parts of the brain play a specific role in the processing of information, its memorization, and subsequent use in various activities. (Mayer, 2011) (Meyer, 2014) (Milem, 2005) (Rose, 2002) (Rose D. H., 2006)

Precisely universality as the principle of educational design allows involving in the learning process not only students with disabilities, but also all, including the teachers themselves. Developing a curriculum and teaching materials based on universal design, the teacher analyzes what nuances a student may have during learning. The teacher should pay attention to several aspects simultaneously: the student’s physical needs through assistive technologies; cognitive, organizational, and motivational - through effective teaching. Versatility is achieved by providing all students with different educational needs with different alternatives, options within flexible training modules. It should be noted here, the difference of universal design from differentiated learning, which is based on the modification of ready-made "unified" programs based on an assessment of the individual needs of the student.

According to some foreign scientists (LS Vygotsky; E.McWilliam; R.Felder & R.Brent; J.Milem, J.Mitchell & A.Antonio), several factors play an important role in learning: the difference between social classes, different the level of understanding and perception, gender, freedom, sexuality, religiosity, ethnic origin and racial indicators, as well as personal characteristics. And all this requires special attention in the teaching process, especially in inclusive groups. The most important thing in improving the teaching process is the professionalism of teachers. For example, David Rose emphasizes that a professional teacher uses not only informational material, but also facial expressions, voice, body movement, etc. Universal design of learning involves applying of all methodologies of classical pedagogical science, as well as all modern methods. Here we are talking about digital educational materials, auxiliary information technologies. (McWilliam, 1999) (Milem, 2005) (Rose D. H., 2006) (Vygotsky, 1983)

5. Including innovations for universalization of education

In their works, foreign scientists Boone, R., & Higgins, K.; McWilliam, E. and the others, emphasize that information technologies can be used to personalize education and make it more interactive, that interactivity remains central to effective learning. The use of technology affects the motivation of students and teachers. It is important to correctly determine which media and which information technology is best suited for more efficient use.

Talking about the digital divide, it should be noted, that at present, when developing computers, mobile devices and various applications, mobility, sight and hearing limitations are necessarily taken into account. And most operating systems and devices have special features that professional teachers have to know for use in universal education design.

Already developed many services and applications that facilitate the learning process and, in general, life. Several of them should note: Windows and MacOSX systems have embedded modes that allow people with disabilities to use this system, use the Internet, etc., speech recognition and other parameters for people with disabilities. In the Apple system devices, are built in various technologies that allow people with vision, hearing,

and physical skills limitations to gain knowledge and develop. In the Google Chrome browser and in Google documents, are available image resizing, speaking and voice interface. (Boone, 2005) (Kukuev, 2010) (McWilliam, 1999) (Meyer, 2014)

There is an application for phones “Be my eyes”, whose job is that a user with visually impairment or not seeing, if he does not see something around, can direct the camera to the place where he wants to watch something, and the volunteer tell him online what's where. The application Yandex Talk on Android for people with hearing or speech impairment, it simplifies communication between people with and without disabilities.

"Tecla device" allows people with limited mobility to access a smartphone or tablet. The adaptive site “Online cinema for the blind” has applied technology that allows people with visual impairments to understand what is happening on the screen, in addition, the site has collected comments on what is happening, written in Braille. The Smooth service is the first service of building routes in the city with circumvention of obstacles, indispensable for people with limited mobility. The application "Soudofon" helps deaf and hard of hearing people in creating a comfortable communication environment. All of the above digital technologies and applications, if necessary, can be used by teachers in the learning process. This enriches the basis for improving the system of universal design in education. (Meyer, 2014) (Milem, 2005) (Rose D. &, 2002) (Rose D. H., 2006)

Conclusions

Tools are effective only when uses them correctly. We should not forget that all teaching materials and tools are effective only when the teacher uses them correctly. The main task in preparing classes using the principles of universal design is to provide students with the choice opportunity, think over alternative types of tasks and different ways of presenting materials, methods and forms of assessment, pace of work, etc. The implementation of the system of universal learning design allows solving many problems of the transition period, to pay attention to the peculiarities of students' personality development. Universal design in education improves the development of inclusive forms of education and professional competence of teachers.

At the end, I would like to reiterate that inclusive education is not only the physical introduction of students with disabilities into the learning process. Studying the numerous works of scientists in this field, we can formulate the following definition: “Inclusive education is a multifaceted pedagogical science, the fundamental basis of which is versatility, uniqueness, value of all students, designed to ensure the effective implementation and participation of every person, including people with disabilities contributing to their further full social engagement.

This is an advanced and innovative system of organization of the teaching process. This is such as arrange the educational process, which can be achieved, by improving pedagogical science, observing the principles of universal education design. These are new approaches that ensure the full understanding and acceptance of information by all students. These approaches take into account all the diversity, labor and aesthetic education, endowments and the individual characteristics of all students.

Abstract

Today, lifelong education of personnel is the process of formation of each employee's high professionalism, modern economic thinking, ability to work in economic relations. In this article, the authors explore impact of Information Technologies' (IT) implementation into the work of human resource departments for increased effectiveness. Modern relations at the enterprise require the most important network-based enterprise's unit that is to be a strategic, flexible, cost-effective and service-oriented division of the organization. The authors use the experience and initiatives of enterprises and national banks to show implications of the implementation of IT in Human Resources Management (HRM). Although the influence of IT on HRM has been a focus of scientists' attention, no empirical research has been conducted in this area in Azerbaijan. Obtained data show that IT is not widely used in organizations to perform HRM functions in the dynamic economy of Azerbaijan. The results also show that, while IT should have a certain impact on all sectors in terms of HRM, the used IT types vary considerably in recruitment, maintenance and development tasks.

Key words: Lifelong Education, HR Effectiveness, Recruitment Needs, Maintenance and Development Tasks, Management and Planning Tasks

Introduction

In the workplace, the functions of the organizer of lifelong education of personnel are carried out by training units or the staff divisions. Continuing education of personnel includes professional development, secondary vocational guidance or retraining. Most forms of advanced training are associated with specific changes in technology and information and communication technologies.

The rapid development of IT, as well as their implementation in all spheres of human life in recent years, has led to a dramatic expansion of information interpretability. It is impossible today to imagine an enterprise space without IT (Ferratt et al., 2005).

Enterprise-wide information systems is an organizational streamlined, interconnected set of techniques and methods used for storage, processing and dissemination of information for the achievement of the desired objectives. Such an understanding of an information system involves the use of special computer engineering

and communication tools as basic technical means of information processing for implementation of specific processes at enterprises (Agarwal & Ferratt, 2001).

The creation of an information system assumes that the basic operations of accumulating, storing and processing information are assigned to computing equipment, while the professionals perform only a certain part of manual operations or accomplish procedures that require a creative approach in preparing management decisions (Eddy et al., 1999). At the same time, computing equipment works in close cooperation with specialists who control its actions, change the values of separate parameters in support of operational objectives, and enter input data for meeting challenges and management functions (Klein et al., 2001).

This study is devoted to the analysis of IT used in the personnel departments of commercial enterprises and several banks in Azerbaijan. The study aims to highlight several issues:

- What technologies in personnel management do enterprises and banks in Azerbaijan use?
- Does IT of personnel department facilitate the overall efficiency of enterprises and banks?
- Are there any differences in the impact of IT in national and international banks in Azerbaijan?
- Would IT of personnel department be able to influence the organizational performance of banks in Azerbaijan?

The study is prepared in four main parts. The paper first provides a review of the literature. In the second part, the methods used are described and explained. The third part is devoted to the analysis of empirical results. Finally, in the fourth part, the study concludes consequences of the introduction of IT in HRM.

Research methods

The aim of the research is to determine the extent to which the organization's work capacity is influenced by lifelong training presented for all categories of personnel in terms of advanced training in the field of IT, and how modern IT is involved in the effective functioning of enterprises.

The objective of the presented research is clarifying the influence of IT on personnel support at an appropriate level and the improvement of professional qualifications, the impact of technology on the acquisition of professional knowledge outside the core business, the development of planning and organization skills using software products. **The work is performed within the framework of the methodology**, assuming analytical methods that are formed from data obtained as a result of observations, questionnaires, surveys, collection of the necessary primary documentation.

Several Azerbaijani state and private banks were taken as an object of study and the impact of lifelong education in the field of increasing ICT competence to improve the effectiveness of organization management was investigated.

The paper presents the results of the influence of IT investments on return on human capital in the banking sector. **The analysis techniques of this research** is using information flows (mainly cash flows) of a small dimension at the micro level, to identify the overall structure and functions of the management system, as well as to improve existing information flows.

Impact of IT in HRM on the example of international and local banks in Azerbaijan

As authors have already noted, information technologies expand management capabilities when working with personnel; the banking sector is not an exception.

The main method of data collection for this section of the study is semi-structured interviews with HR directors of selected national and international banks. These interviews made it possible to collect information about personnel technologies in banks and the level of IT development in HRM. Return on investment in the staff of each bank is calculated to count the effectiveness of personnel.

It is also expected that IT in HRM affect the efficiency of personnel management, which positively correlates with the organizational results of banks. To test this hypothesis, it is necessary to compare the results of the organizational activities of selected Azerbaijani banks. There are many different studies on the impact of IT in HRM on bank performance (Fethi & Pasiouras, 2010). Our research is focused on HR analytics of selected banks and comparison of results.

Next, an overview of HR technologies in selected banks are presented below.

The authors interviewed the responsible persons of the international bank VTB, the state-owned International Bank of Azerbaijan (IBA) and the private banks Kapital Bank and the Bank Respublika.

According to interviews with the heads of personnel departments, in all HR departments of the above-named banks, there is a payroll division, a division for development, promotion and release of employees, a division for relations with trade unions and public organizations. Kapital Bank also has a personnel analysis division. In the Bank Respublika, there is an unspoken rule under which whatever the reason for dismissal (staff reduction due to production automation, desire for professional growth, or just wanting to change of scenery), an employee who left his place is not accepted back. According to the results of the study, the authors concluded that only the Human Resources Management Department of Kapital Bank is involved in marketing and in building financial budget and strategy as a whole. This department supports line manager staff and employees and interacts with managers as business consultants. In the remaining banks, HR representatives are responsible for operational processes in the field of personnel management and do not act as strategic business partners. In all these banks, candidates can apply online to the bank's website. The Bank Respublika is an exception, where 10% of applications comes at the email address of the HR department.

The functionality of modern personnel services is constantly changing, along with their names, reflecting the specificity and level of penetration into the internal affairs of an enterprise. The interviewees of all organizations confirm the impact of HRM on all processes of the enterprise. The ramified structure of VTB's HR department is responsible for communication with managers, regulates the human resources of the bank, for example, graduate recruitment, hiring experienced employees, relations with employees, their training and development, etc. HR managers communicate directly with managers of other departments, provide their personnel requirements and consult based on discussions with expert centers.

Many HR functions are automated by software solutions. As the interlocutors noted, in most cases each HR area is supported by a specific technological platform. In Kapital Bank, the Learning and Educational System administer the training and development; Graduate Recruitment System supports the recruitment, the remuneration of employees is also controlled by the automated system. In addition to the mentioned information technologies systems, the International Bank of Azerbaijan has a database that covers all records of employees from their recruitment upon retirement. These data cover personal information, qualifications, employee performance figures, vacation reports, salary information, etc.

Still, the main areas covered by the personnel departments of the banks under survey are personnel documentation and administration tasks in accordance with developing Azerbaijani legislation, and hiring and benefits management (Guliyeva & Rzayeva, 2019). It also shows poor developed information systems in the field of personnel management in Azerbaijani banks.

Further, based on the formulas, the relationship between HR efficiency and performance of banks upon application of IT will be described; indicators of personnel management excellence, cost of human capital and efficiency of banks will be calculated. All necessary data were collected on the websites of the respective banks or in the process of interviews with responsible persons.

Now a few words about the general indicators of the economic efficiency of personnel service (Kesti & Syväjärvi2015). The HC ROI (Human Capital Return on Investment) indicator in various HR spheres demonstrates the effectiveness of investments, calculates the results of return on investments in personnel. This indicator is calculated by the formula:

$$\text{HC ROI} = (\text{Revenue} - (\text{Expenses} - \text{Compensations})) / \text{Compensations}$$

This method of evaluation is quite time-consuming. In the calculations, it is necessary to take into account not only the cost of a specific event, but also indirect costs associated with it, but the most difficult is a calculation of income from the event held in the field of personnel management. As indicated by Bontis and Fitz-enz (Bontis & Fitz-enz, 2002), HC ROI is equal to the value added of investments in an organization's human assets. The numerator in this metric is the profit adjusted for the cost of people. The higher the HC ROI, the more effective the personnel management in the bank.

The main indicator of employee productivity is human capital income (HCRF – Human Capital Revenue Factor) - the ratio of the total income by indicator of employees working full-time (FTE – Full-time Equivalent):

$$\text{HCRF} = \text{Income} / \text{FTE}$$

It should be noted that this indicator is rapidly becoming obsolete.

The cost of human capital (HCCF – Human Capital Cost Factor) shows the proportion of staff costs in circulation and is calculated by the formula:

$$\text{HCCF} = \text{Total Staff Costs} / \text{Turnover}$$

The profitability of the "average" employee of the organization shows the indicator of HCVA (Human Capital Value Added):

$$\text{HCVA} = \text{Income} - (\text{Costs} - \text{Salaries and Bonuses}) / \text{FTE}$$

The results of the calculations, as well as a summary of interviews with the personnel directors of four banks, are presented in the table 1 below.

Table 1. Results of the calculations related to employee productivity*

	Local private Kapital Bank	Local state IBA	Local private BR	International Bank VTB
Number of Employees	2700	1800	1050	300
HR Technology	SAP	Specific HR technology applications developed by other bank's headquarter	Specific HR technology applications developed by other bank's headquarter	Specific HR technology applications developed by other bank's headquarter
Number of HR Professionals	20	20	11	9
HC ROI Employee	5,824151021	1,107982414	3,118410596	14,68444615
Expenses/Headcount	48641,07143	96123,33333	1076,190476	9894,033333
Revenue/ Headcount	188584,5238	112402,2222	22780	41493,66667
HCRF	56452,38095	447780	12739,04762	24416,66667
HCCF	0,153824545	1,341210138	0,031564865	0,00522168

	Local private Kapital Bank	Local state IBA	Local private BR	International Bank VTB
HCVA	168952,381	167033,8889	22422,85714	31816,3

Source: Authors' calculations

*The data for calculations are collected on the official website of respective banks

The data presented in the table demonstrate that the international bank VTB has a higher return on human capital from investments. HC ROI, equal to 14.6, means that one monetary unit invested in the human capital of the bank returns 14.6 monetary units. Indicators of Azerbaijani banks demonstrate somewhat lower efficiency. The ratio of income and expenses of employees shows that an international bank spends more money on its employees as compared to national banks. Since the level of development of HR technologies at the international bank is higher, and the efficiency of personnel management, as well as performance indicators, is better, a correlation between IT HR and personnel management efficiency can be observed.

Suggestions

The essence of the new technological revolution coming in the global business and banking system is to increase the yield of a business due to its knowledge, qualification of personnel and technology.

Banking in its present form is quite new for the economy of Azerbaijan, and it is also rapidly changing. Apparently for this reason, banks have not yet had enough time for any specific formation of the so-called near banking space, to which we refer to institutions of lifelong education. The part of the vocational education system, which deals with the training of bank cadres, in its turn, was not well enough impregnated with the state of the banking system in order from a theoretical standpoint to identify possible trends and to propose personnel improvements in accordance with them. In order to find out who banks need today and will need tomorrow, a clearly formulated marketing strategy for the system of lifelong professional education is needed (Chetkinkaya, 2012).

Efficient integration of a banking specialist into the process of practical training with real banking activity is impossible without the establishment of banking schools as economically independent, innovative educational institutions that maintain high quality standards of banking learning in a dynamic and competitive educational services market. It is the organizational structures of the recipient of continuing education that should be primary in determining the main directions of training. In the Azerbaijani banking sector, for example, in recent years, growth in demand for bank employees occupied in the retail business, collaborators for branches, credit and cash offices, is still predicted (Hasanov, 2013).

Discussion

At present, the role of information technology in people's lives has significantly increased. Modern society is involved in the general historical process, called informatization. This process includes the development of the system of continuous education, the penetration of information technologies into production, public spheres, including banking systems.

The article analyzes the use of information technologies in banking management from the point of view of continuous personnel training. The study shows the importance of information models and technologies in management reveals the features of information management in the banking sector.

Despite the high values of indicators characterizing the duration of training, the implementation of the principles of continuous education in Azerbaijan is difficult in practice. This is due to the lack of a lifelong education system (uniform regulatory framework for educational institutions, self-regulation and self-organization mechanisms), as well as a decrease in funding for this area, uneven access of the population to education

throughout life, increasing the cost of educational services as people engage in professional activities, decreasing the economic return from education with age (demotivating factor of investing in adult education). However, according to many respondents, factors that impede professional development include the lack of free time, financial resources, as well as lack of initiative of employers and the lack of refresher training courses.

At the economic level, the possible reasons for this situation may be lack of interest of funds from organizations to pay for courses or failure of technological changes in production. However, these assumptions require additional research to prove or disprove them.

Conclusion

A major breakthrough in the development of information technologies have greatly simplified the work of commercial institutions, making the internal structure and relationship system more convenient for employees; enterprises themselves are more accessible and more comfortable for customers. In the commercial sphere, information technologies are used in various forms, as in any organization. The most necessary of them are technologies for internal interaction of personnel and management.

The article examined the impact of information technologies personnel management as a set of software and IT, analyzed how the use of software products in personnel management can improve the efficiency of enterprises. The authors has built a model for using IT tools to perform various functions of personnel management in enterprises and in the banking sector. Based on the survey data, the results, firstly, showed that IT has a significant impact on all sectors in terms of management and planning tasks, and, secondly, the type of IT used varies considerably for recruitment tasks, as well as by functions of staff support and development. However, there is no standardization in integrating computer software into the core activities of HRM; there are no information systems in Azerbaijan that alone could cover the needs of a modern enterprise. Medium and large organizations usually operate at least a dozen multi-user systems. It can be explained by the gap between job requirements and the ability of employees to perform personnel management tasks. There are still problems with personnel in terms of elementary computer illiteracy. The survey showed that not all enterprises have special HR software. Most likely, it is expected that this situation will continue in the near future.

In future empirical research, the possibilities of introducing new information technologies into personnel management processes should be explored to improve HRM in the direction of optimizing personnel costs and to strengthen the efficiency of enterprise management as a whole through the rational use of its intelligence potential. Despite the fact that in Azerbaijan there is an acute need for the use of modern personnel management system, insufficient attention is paid to the issues of staff case administrating by IT means on the part of supervisors.

Education, Employment and Poverty: Interdependence

Nazim MAMMADOV¹

*¹ Researcher, Scientific-Research Institute of Economic Studies (UNEC), Azerbaijan,
Email: nazim_mammadov@unec.edu.az*

Abstract

The strategic goal of the economy development of each country is to ensure the required quality of life of the population. As in other countries, the ultimate objective of socio-economic development of Azerbaijan is to improve the well-being of the population and its quality of life. As one of the most important means of increasing the income of the population and reducing poverty in Azerbaijan, it is possible to increase the education of the population, because better education means an increase in the level of human capital, which should normally lead to an increase in incomes. At the same time, in the absence of good education of the society with poor social and income mobility (including intergenerational), low income or poverty may be intensified. If the increase in education of the population does not concern to the poor groups, then the increase in education does not lead to a decrease in poverty. This raises the issue of access to education for low-income groups of the population. At the same time, it is necessary to have a normal advantage of education, that is, to increase the income according to the level of education. The paper examines the issues of interdependence of education, poverty and employment from different views. The current state of the quality of education is analyzed. The paper focuses on the education and employment policy of the population, including the financing of education. Research methods such as systematic scientific analysis, logical generalization and statistical analysis are used during the study. The paper can be useful for the social policy of the Azerbaijani government and be considered important for local and foreign researchers.

Keywords: education, poverty, employment, financing of education.

Introduction

The systemic nature of the quality of life is expressed through a complex structure of relationships between its components - the standard of living, the quality of the environment, the quality of public health, the quality of working life, spiritual quality, the quality of education, which are in a certain economic, institutional, social and economic environment. Such system integrity allows to see the integrating, system-forming role of quality of life in a new way. The quality of life of the population is defined as a system of reproductive relations to meet the full range of needs and interests of people, manifested in various forms of activity, and in the very sense of life. The problem of quality of life covers the conditions, results and nature of work, the level of family well-being, institutional, social and environmental aspects of human existence (Əlirzayev Ə.Q. 2016).

One of the problems hindering the development of the well-being of the population and improving its quality of life is the poverty of the population. The poverty of the population largely determines the poor quality of life, as well as significantly limits the opportunities for business development, since the accumulation of population around the world is the main source of investment, giving impetus to the development of the economy. As a result of the fact that the population cannot provide themselves financially, there was a maximum distrust of both market agents and people to each other, which led to a reduction in the use of credit resources for development. It is impossible not to agree that poverty leads to a decrease in the quality of human capital, negatively affecting the level of health and education, the motivation of labour and social activity of the population, leads to an increase in social tension, thereby significantly impairing the opportunities and prospects for sustainable economic development. Poverty is a consequence of diverse and interrelated reasons, which are combined in the following groups: economic (unemployment, low wages, low productivity, lack of competitiveness of the industry), socio-medical (disability, old age, high levels of morbidity) and demographic (single-parent families, a large number of dependents in the family), socio-economic (low level of social guarantees), educational

qualification (low educational level, insufficient professional training), political (military conflict, forced migration), regional and geographical (uneven development of regions) (Əlirzayev Ə.Q. 2018).

From the above it can be concluded that the problem of poverty is universal, because in one form or another it is inherent in any economic system. At the same time, it should be noted that the severity of this problem in society varies greatly depending on the volume of product produced and accumulated wealth, productive capacity, methods of distribution of material goods and income. At present, the issues of poverty and income inequality research are becoming particularly relevant due to the fact that these problems are global in nature and require concerted action by all countries. The definition of poverty as inequality is the consideration of the problem through the property differentiation of social groups. The uneven distribution of wealth and services leads to inequality of economic well-being, which, in addition to a positive stimulus, has negative manifestations. The negative consequences of inequality include the formation of a standard of living in a part of the population that does not allow to satisfy even the basic economic needs to which belong: first, the needs for the most urgent benefits, first of all, in food, clothing, housing; second, the needs that are already familiar in this society (Mikayilov F.Q., 2016).

Poverty is a fundamental global problem facing the world community. It has a detrimental impact on the economy, social relations, politics, culture; it has a direct impact on the fundamental characteristics of any person's life, such as health and education. The strategic goal of economic development of any country is to ensure the quality of life of the population necessary and sufficient for expanded reproduction. The specifics of the economic development of Azerbaijan and other countries cannot be determined by the immediate needs of the economy and society, which is due to the peculiarities of the economic and historical development of the country for a long period of time and modern problems, as well as trends in world economic development. The ultimate goal of the socio-economic development of the country and its regions is to ensure the well-being of the population and improve its quality of life.

As the most important means of increasing the income of the population and reducing poverty in Azerbaijan, it can be increasing the education of the population, because higher education means an increase in the level of people, which should normally contribute to an increase in income. At the same time, in the absence of a good education of a society with poor social and income mobility (including intergenerational), low-level income or poverty can be strengthened. That is, low-income groups have the opportunity to increase the level of education of themselves and their children. If the increase in population education does not belong to the poor groups, then the increase in education does not lead to a decrease in poverty. This raises the issue of access to education for low-income groups of the population. Thus, it is necessary to have a normal benefit of education, that is, to increase the income corresponding to the level of education. Thus, as inequality in the field of income affects inequality in the field of education, there is also a counter-effect (Muradov A., Hasanli Y., Musayeva F. 2019).

The economic benefits of education, which was quite volatile in the 1990s, have now stabilized at a level similar to that of the countries of the market economy. This once again marks the value of investment in education as a means of ensuring an adequate standard of living, especially for the poor. But the economic benefit of education is not only accessibility, but also the quality of education. The quality of education is not so optimistic in comparison with the scope (Ağayev R., Mehtiyev A. 2010).

Level of education

Low level of education is an important factor of potential poverty. According to the results of the survey, the risk of poverty exposure of persons with only primary education is 20-60% higher than that of others on average across the country. On the contrary, the probability of persons with higher education being in poor condition is

lower than average. This ratio is observed more seriously in the countries of rich Eastern Europe with high educational benefits, but it also applies to the poorest countries in Central Asia (Poverty and Shared Prosperity 2018).

In the early stages of labour market policy, attention was focused on training, job creation measures and helping new businessmen. But these measures were usually not targeted. For example, if there was training for professions that were not in demand in the market, or if the newly recruited businessmen from the list of registered unemployed were offered support, the skills of doing business were not taught (Bağırzadə M. 2009).

Retraining

In most countries, great attention is paid to the retraining, which is in the first place among the programs related to the stimulation of employment. It is the next program that follows after the creation of small enterprises for unemployed people, taking into account the needs of the labour market, from the point of view of retraining – provision of employment to the degree of efficiency. During the transition period, the percentage of those employed in many countries rose. The survey conducted by the employment services shows that retraining is mainly aimed at young and well-educated people who already have more chances of finding a job. In contrast, access to retraining for elderly, low-educated and less fortunate persons in the labor market is a prerequisite. At the same time, experience shows that many of these individuals are not really interested in retraining and tend to prefer less responsible programs, subsidized jobs, or social work in the field of employment, or to receive social assistance (ILO, World Employment and Social Outlook 2018).

One of the factors of successful employment of participants after the completion of retraining courses – taking into account the needs of the enterprise – is the more active participation in retraining of employers who can get trained employees. In order to prevent dismissal for a low qualification, retraining, calculated to accelerate the provision of employment to persons employed or elsewhere, is also the most effective form of employment.

Education

The decline in the volume of funding and the decline in efficiency in education have affected the education opportunities of the poor population. The number of children admitted to compulsory primary school, especially secondary school, decreased in many CIS countries in the 1990s (Ağayev R., Mehtiyev A. 2010). The decrease in the number of students and the increase in the inequality of access to education have long-term effects: they disrupt the opportunities for future living with children from relatively poor families.

The level of education is correlated with the risk of belonging to the poor group of the family. For example, in families where the head of the family has only basic education, the probability of being poor is 20-60% higher than in average statistical families. The existence of primary technical and vocational education determines the probability of poverty to a moderate degree, the existence of secondary education reduces such a probability almost twice; higher education almost excludes the risk of poverty (Poverty and Shared Prosperity 2018).

Market conditions are not able to provide equal opportunities for Independent Education. The solution of this problem is the exceptional authority of the state, which is obliged to develop and implement a balancing strategy to ensure equal access to education (Hasanli Y.H., Shabanov S.A. 2018).

Poverty on inheritance

The assessment of the level of poverty carried out by the World Bank in different countries shows that the education period of children from poor families is the lowest. Even when they grow up, they do not spend extra time on education. As a result, their literacy level is the lowest (Poverty and Shared Prosperity 2018). There is dependence between the possibility of being poor and the personal level of a person. That is why parents with

low-level education can become vulnerable to poor welfare of their children. If measures are not taken to overcome this desperate situation, poverty can be "passed on" from generation to generation.

Financing

The main factor providing equal access to education is the policy of financing education. At present, education is facing serious financial difficulties, which will continue in the future, as expected in transition countries. It is expedient to finance education from a centralized state budget, since in this case, it is easier to ensure a fair distribution of education costs at the local level. In addition to financing education based on source taxes, financial mechanisms are also used, which provide for partial payment of education costs in all transition countries (World Development Report 2018).

There are some positive moments when education is paid (for example, by paying, parents have more control over the quality of education). However, the excessive propensity to this source of funding for education creates two risk factors. First, international studies have shown that the pay for education prevents children from getting education from poor families. Secondly, schools that require a fee for education, as a rule, are located in expensive areas, that is, in areas where families already have good access to education live. In this case, attention to local taxes and the fee-paying education in the financing of education will most likely lead to a deepening of the inequality of the territories (World Development Report 2018).

It is necessary to either prohibit the collection of "unofficial payments" (unofficial money collections), or to transfer them to the officially received payment area, as unofficial payments create a number of problems. Since these payments are "confidential", there is no legal basis to allocate subsidies for the purpose of helping the poor who cannot afford such expenses. Such payments create more cases of corruption. It is acquired not officially and is usually used inefficiently. In the best case, unofficial payments should be transferred to the official category and identified by relevant normative documents. At the same time, the documents should also include special provisions for children from poor regions or poor families. It is already accepted everywhere that the most effective option of funds allocated for education is the scheme "money moves after students" (i.e., financing on demand). Such a scheme, which is usually implemented in the field of higher education, is defined as "distribution of funds per capita". The scheme may also provide for the promotion of high-quality education or the efficient use of material and technical resources.

Findings

The effect of revenue differential on employment:

- people with a low level of education have a weaker economic activity, their chances of being among those engaged in the economy are also low, they work in areas with more low wages and have positions that are not high in the hierarchy;
- it is likely that the population from this category will belong to the categories of low-income groups. As a rule, the population with a high level of education can have a high level of employment and income.

The effect of education on income differential:

- The usefulness of education has increased in recent years compared to the mid-90s in Azerbaijan. There are significant differences in the earnings of people with different levels of education;
- the level of income per capita is significantly dependent on education and employment. Statistics show that among the low-income and especially poor population, the low level of education prevails (in comparison with the whole population), while the presence of higher education acts as a certain guarantor of material welfare (SSCAR, Living standards of the population and household research 2018);
- effective measures to reduce poverty - are investments in education.

The effect of revenue differential on education:

- differences in educational opportunities of children from different income-level families are significant;
- the differences are minimal at the level of primary and secondary general education, but significantly increase at the level of obtaining a full secondary education; (high incomes allow the child to study in a full secondary school or a private secondary school, while low incomes do not allow full-time, or allow full-time vocational school);
- the maximum difference in educational opportunities of children is observed at the level of obtaining higher education;
- poverty of the family is an extremely serious obstacle to the education of the child in higher school.

The effect of income differential on the quality of education of children:

- low-income families have lower education opportunities not only in terms of level, but also in terms of quality of education in secondary schools;
- therefore, it is not only due to the fact that admission to higher education is not possible for many, due to material costs, but also due to the fact that the student is not prepared enough quality;
- to increase access to higher education, it is still necessary to eliminate the isolation of families with different income levels at the stage of secondary education.

The effect of income differential on the educational opportunities of the elderly:

- there is an important demand to increase the education of the elderly in poor and low-income families;
- but the factor of material constraints acts as a serious obstacle on this path;
- opportunities for development are also poor because the poor population has low educational potential.

The effect of income differential on the educational expenditure of families:

- a significant part of Azerbaijani families already bear the costs of investing in the education of their children, which is the maximum for the level of higher education;
- these costs differ significantly in families of different income levels (in low-income people this is quite low), but if we compare them with per capita income, the share of education costs in low-income families is high enough (SSCAR, Income and expenses of the population 2018);
- it is likely that these families perceive education as an important resource of social and property mobility and are even ready to bear these costs by refusing to meet their other needs.

Conclusions

In general, the main factors in the fight against poverty and social marginalization are education and decent employment. People with a relatively high level of education are more likely to be engaged, and engaged people are more likely not to be on the verge of poverty. But it seems that education itself does not guarantee integration into the labour market, since the unemployment rate among people with secondary vocational and higher education remains quite large (MLSPPAR, Annual reports 2018).

Insufficient funding of the education sector, along with very low salaries of teachers, has led to further disruption of the infrastructure, a decrease in the quality of education and the disparity in the use of educational services among the population.

The main results of the study are that education is one of the most important factors of economic activity, employment of the population, increasing the level of income, as well as positions of employees. Thus, the increase in the level and quality of education of the population, the support and stimulation of this increase acts

as an important instrument of the policy of combating poverty. However, in addition to factors such as low level of education, unemployment or lack of work, family belonging to the poor is also significantly affected by the regional factor (the size of the labour market and national characteristics), a small town or rural housing, the number of family members, large families. (SSCAR, Poverty rate and poverty level 2018).

Secondly, low incomes of families (especially poor) significantly limit the educational opportunities of family members, both adults and children. This applies to vocational education, in part to primary and secondary school, more to full secondary and secondary vocational education, and in particular to higher education. The inequality of educational opportunities manifests itself in the distribution of family income according to the level of income, as well as in the proportion of young people of different ages from different families studying in one or another educational institution. But this inequality manifests itself in the quality of young people and adults from different income-level families, including access to both higher (first of all) and secondary vocational and general secondary education. Inequality takes place both at the level of educational claims and at the level of probability of actual inflows to one or another educational institution (SSCAR, Statistical indicators of Azerbaijan 2018). The actual costs of education, as well as the ability and readiness to pay for different forms of education of children and adults, are an important factor in the structure of the family budget. Social policy measures aimed at reducing the level of poverty and eliminating the inequality of education should cover all levels of education.

**Effects of Globalization on Economic Development:
Evidence from the G-20 Countries (1990-2017)**

Abstract

In this study, the effects of globalization on economic development in the G-20 countries, which are grouped as developed G-9 and developing G-10 according to their economic development levels, were econometrically analyzed for the period 1990-2017, by using panel data analysis methodology which pays regard to the extended Cobb-Douglas production function and cross-sectional dependence. In this respect, it is aimed to evaluate empirically the effect of the globalization process on the differentiation of long-term economic growth performance and development levels of countries in G-9 and G-10 groups, in the present study. As a result of the study, it was determined that globalization process had a significant effect on economic growth in G-9 group countries by the examination period while globalization process had no effect on economic growth in G-10 group countries. These results show that globalization level as well as physical-human capital accumulation and technological development have a significant effect on the differentiation of the long-term economic growth performances and development levels of developed G-9 and developing G-10 countries during the examination period.

Keywords: Economic Growth, Globalization Process, Cobb-Douglas Production Function, Cross-Sectional Dependence, Panel Data Analysis.

1. Introduction

World economies have been going through a globalization process that started upon the Bretton Woods System after the Second World War, developed with the liberalization of economic policies in the late 1970s and gradually became evident with the disintegration of the Soviet Union in the early 1990s. While the globalization levels of world economies have been increasing rapidly since these time periods, the accompanying positive and negative effects of the globalization process on economic, political and social issues are deepening. Indeed, the process of globalization, on the one hand, positively affect the economic growth performance (welfare level) of countries by increasing international trade, financial integration, international labor force movements, and technological developments, on the other hand, adversely affects the welfare level of countries by causing some deterioration in social and environmental standards. Therefore, at the present time, there is no consensus on the effects of the globalization process on economic growth and the relationships between the globalization process and welfare level are explained by two different approaches. According to the supporters of globalization, the process of globalization increases the welfare level of both developed and developing countries and decreases the differences between the development/income levels of the countries over time. However, according to the opponents of globalization, the globalization process facilitates the exploitation of the developing countries by the developed countries and increases the differences existing between the countries in terms of development/income level, over time. (Hayaloğlu et al. 2015: 120).

From this point forth, in the present study, it is aimed to empirically examine the effects of globalization on economic growth in G-20 countries classified as G-9 and G-10 countries according to their development levels.

For this purpose, in the study, economic, political and social effects of globalization process on the long-term economic growth performance and/or development of the countries in developed G-9 and developing G-10 groups are analyzed econometrically. In the second part of the study, the relevant literature is summarized and the position of the study in the literature is stated. In the third section, the scope of the study is drawn and the data set is explained. In the fourth chapter, the effects of globalization on economic development of the developed G-9 and developing G-10 countries were econometrically analyzed for the period 1990-2017 by using panel data analysis methodology which takes account of the extended Cobb-Douglas production function and cross-sectional dependence (CD). The study is completed with the fourth chapter in which findings of the study are discussed.

2. Literature Review

When the relevant literature is examined, in the empirical studies discussing the effects of globalization on economic growth, economic indicators¹ in the form of trade openness, foreign direct investments, average customs tariff rates, etc. or the indicators in the form of indexes derived by international organizations² are seen to be used as the representative of the level of globalization. While only the economic dimension of the globalization level is considered in the economic indicators, in the index-shaped indicators calculated with the use of various variables of different nature, the economic, political and social dimensions of the globalization level can be measured as a whole. For this reason, in the predominant part of the empirical studies investigating the effects of globalization on economic growth, index-shaped indicators covering the economic, political and social dimensions of globalization level are used.³ The KOF Globalization Index, calculated by the Swiss Economic Institute, is one of the most commonly used indicators. The fact that the KOF Globalization Index covers a wider time period and country compared to other indices, as well as, that it is updated on a regular basis, is decisive in this situation. The KOF Globalization Index, created by Dreher (2002) and Dreher et al. (2008), is calculated separately for the economic, political and social level of globalization by using 23 indicators of different nature (KOF Index of Globalization, 2016).⁴ In this context, when the relevant literature is examined, it is seen that empirical studies are generally conducted on developed and developing countries by using the KOF Globalization Index and within the scope of panel data analysis. In their studies within this scope, Dreher (2006), Chang and Lee (2010), Villaverde and Maza (2011), Ali and Imai (2013), Leitao (2013), Gurgul and Lach (2014), Sincere and Jenatabadi (2014), Ying (2014), Suci et al. (2015), Zahonogo (2017) have reached to the conclusion that general, economic, political and social globalization has a positive (positive/statistically significant) effect on economic growth. On the other hand, in their studies within this scope, Samimi and Jenatabadi (2014), Ying (2014), Hayaloğlu et al. (2015), Chu et al. (2016) have determined that general, economic, political and social globalization has either negative (negative/statistically significant) effects or no effect on economic growth. In this study, the effects of economic, political and social globalization on economic growth are examined considering the differences in the level of development of G-20 countries. In this respect, it is considered that the findings of the present study conducted by taking into account the differences in the development level of the G-20 countries and the economic, political and social effects of the globalization process will contribute to the development of the theoretical and empirical literature on this subject.

¹For some of the studies within this scope, see Levine and Renelt (1992) and Stiglitz (2004).

²See, for example, Dreher (2006), Heshmati and Lee (2010), Chang et al., (2013).

³Some of these indicators representing globalization derived in the form of index can be listed as the Kearney Foreign Policy (KPF) Index, CSGR Globalisation Index (Centre for the Study of Globalisation and Regionalisation) and the New Globalization Index (NGI).

⁴For detailed information on the scope and calculation methods of the economic, political and social sub-indices of the KOF Globalization Index, see: KOF Index of Globalization, 2016.

3. The Scope and Data of the Study

In this part of the study, the effects of globalization on economic growth in G-20 countries are analyzed econometrically on an annual basis for the period 1990-2017. (The fact that the data obtained from the WB database is available for all G-20 countries in the 1990-2017 period uninterruptedly is influential in determining this period as the scope of the study). In addition, G-20 countries are included in econometric analyzes as developed G-9 and developing G-10 countries according to their economic development levels in order to investigate the effects of globalization on economic growth without any deviation. (Developed countries in the G-9 group are listed as USA, France, Germany, England, Canada, Italy, Australia, Japan and South Korea; developing countries in the G-10 group are listed as People's Republic of China, Russia, India, Brazil, Indonesia, Mexico, Argentina, Turkey, Saudi Arabia and South Africa.) In this respect, in the present study, it is aimed to evaluate empirically that in what extent the globalization process is effective on differentiation of long-term economic growth performance and development levels of countries in G-9 and G-10 groups. The variables used in the econometric analysis of the study and their sources are defined in Table 1.

Table 1. Identification of Variables Used in Analysis

Abbreviations for Variables	Definitions of Variables	Data Sources of Variables
RGDP	Real Gross Domestic Product (2010-USD).	(World Development Indicators-WDI-2019) The World Bank-WB
RGFI	Reel Gross Fixed Capital Investments (2010-USD).	
EL	Employed Labour Force	The Conference Board-Total Economy Database (TED-November 2018).
TFP	Total Factor Productivity	
KOFG	KOF General Globalization Index	Swiss Economic Institute (KOF Index of Globalization-2019).
KOFE	KOF Economic Globalization Index	
KOFP	KOF Political Globalization Index	
KOFS	KOF Social Globalization Index	

The annual growth rate values of the macroeconomic variables such as RGDP, RGFI, EL and TFP, and of the index-shaped variables used to represent the globalization process such as KOFG, KOFE, KOFP and KOFS which are defined in Table 1, are used in econometric analyses. Among the variables in Table 1, RGDP is taken as real GDP per capita (2010) values in US dollar (USD) prices for all G-20 countries from WB database. The RGFI variable was calculated, for all G-20 countries, in per capita values, by proportioning the real fixed capital investments series obtained from the WB database with 2010-USD prices to the mid-year total population series. Since Saudi Arabia's fixed capital investments series for the period 1990-1999 are not found in real form in the relevant database, the fixed capital investments series of this country in the period 1990-1999 are taken as nominal (USD) and converted into real form with the use of the country's GDP deflator. The EL was calculated for all G-20 countries by proportioning the number of employed labour force series obtained from the TED database to the mid-year total population series. TFP was taken from TED database for all G-20 countries as data calculated over annual growth rates. The data for the variables, KOFG, KOFE, KOFP and KOFS which are used to represent the general, economic, political and social level of the globalization process, respectively, were obtained from the relevant database for all G-20 countries.

4. Econometric Methods and Findings of the Study

The econometric models established in the study in order to identify the effects of globalization on the economic growth of the countries in the G-9 and G-10 groups are based on the extended Cobb-Douglas (CD) total production function. The CD total production function extended as so reflecting the impact of globalization and technological development level on economic growth can be expressed as in Equation 1:

$$Y_{it} = A_{it} K_{it}^{\alpha} L_{it}^{\tau} G_{it}^{\gamma} e^{\varepsilon_{it}} \quad (1)$$

Here, (*i*) and (*t*) show countries and time, respectively, while (ε_{it}) indicates errors. Of the terms in the production function, (Y_{it}) represents economic growth (RGDP), (A_{it}) technological development level (TFP), (K_{it}) physical capital accumulation (RGFI), (L_{it}) human capital accumulation (EL) and (G_{it}) the general, economic, political and social level of the globalization process (KOFG, KOFE, KOFI and KOFI). Besides, considering the development process of economic growth theories, the level of technological development in production function (A_{it}) is assumed to consist of TFP increments. It is accepted that the increase in TFP, which constitutes the portion of economic growth that cannot be explained by the changes in the physical quantities of production factors in the form of physical-human capital accumulation, indicates the production increases provided by solely technological development as "Solow Residual" (Solow, 1956: 85-91). Under these assumptions, by taking the natural logarithm of the CD total production function defined in Equation 1, the extended CD model to be estimated econometrically in the study can be arranged as follows:

$$Y_{it} = \beta_{it} + \alpha_{it}K_{it} + \tau_{it}L_{it} + \delta_{it}TFP_{it} + \gamma_{it}G_{it} + \varepsilon_{it} \quad (2)$$

However, in the study, since the general, economic, political and social level of the globalization process is represented by variables of different nature, alternative variations of the model defined in Equation 2 are estimated, in order to avoid multiple linear connection problems. In the study, the basic form of econometric models to be predicted for the period 1990-2017 using panel data analysis methodology that takes into account CD is shown in Equation 3:5 In the practical studies dealing with the potential determinants of economic growth, setting econometric models by extending the CD production function is frequently used. (For some of the studies within this scope, see: Levine and Renelt (1992), Rodrik (2012).

Model: $RGDP_{it} = \alpha_{it} + \beta_1RGFI_{it} + \beta_2EL_{it} + \beta_3TFP_{it} + \beta_4G_{it} + \varepsilon_{it} \quad (3)$

Since the level of globalization (G) in the study is represented by indicators such as COFG, COFE, KOFI and KOFI, 4 different variations of the basic model defined in Equation 3 are estimated in accordance with the above order. Of the terms shown in the model, (α) indicates the fixed parameter, (β) the slope parameter, (*i*) the cross-sectional dimension of the panel and (*t*) the time dimension of the panel. The models defined on G-9 and G-10 groups in the study are estimated in four main stages by using panel data analysis methodology considering CD. In this context, since the presence or absence of CD in the variables / in co-integration equations of the models directs the econometric methodology, in the first place, the presence of the CD in variables/co-integration equations in the models should be examined using the CD-LM tests, and the consecutive tests, which are necessary to use in the following stages of analyses, should be determined (Menyah et al., 2014: 390-91).

In the present study, the presence of CD in the variables/co-integration equations of the models defined on G-9 and G-10 groups is examined with the CD-LM_{adj} test statistics developed by Pesaran et al., (2008) and it is concluded that CD is present in the cross-sectional units in the G-9 and G-10 groups panel. (These results obtained in consequence that probability values of CD-LM_{adj} test statistics calculated for variables and co-integration equations of the defined models on the G-9 and G-10 groups are less than 0.01, can be seen in Table 2 presented in the Appendix). This demonstrates that the cross-sectional units in the variables and co-integration equations of models defined on countries in the G-9 and G-10 groups are interdependent and that it is necessary to use panel data analyses which takes into account this dependence (Baltagi, 2008: 10-12).

In this respect, the stationarity of the variables in the models defined on G-9 and G-10 groups is investigated by Cross-Sectionally Augmented Dickey-Fuller (CADF) panel unit root test developed by Pesaran (2007) considering CD and it is concluded that all variables in the models are stationary at level value. (Results showing

⁵Gauss 18.0 and Stata 15.0 econometrics software packages are used in the estimation of models defined in the study.

that CIPS statistics calculated at the level value for the variables in the models defined on G-9 and G-10 groups are greater than the critical table values by the absolute value at the significance level of 0.01 can be seen in the Table 3 presented in the Appendix).

Determining that the variables in all models defined on the G-9 and G-10 groups are of the same order (at the level value) and stable (integrated) means that there is along run equilibrium relationship (co-integration) between the model variables (Tari, 2010: 415). However, since all models described in the study contain CD, the long-term effects of the globalization process on economic growth are examined by the Panel AMG (Augmented Mean Group) estimator, which can be used in the presence of CD in the cross-sectional units of the panel and which was developed by Eberhardt and Bond (2009). When the findings in Table 4 presented in the appendix are examined in terms of independent variables which are the main determinants of economic growth, it is seen that the coefficients of RGFI, EL and TFP variables in all models defined on the countries in the G-9 and G-10 groups without exception are calculated as positive and statistically significant in accordance with the expectations. These findings show that in countries in the G-9 and G-10 groups physical-human capital accumulation and technological development level increases/developments have a positive/statistically significant effect on economic growth in the examination period. Whereas, when the findings in Table 4 are examined in terms of the independent variables KOFG, KOFE, KOFP and KOFS, which constitute the essence of the study and represent the globalization process, it is seen that the effects of the general, economic, political and social globalization level on the economic growth of the countries in the G-9 and G-10 groups differ significantly. In this context, as seen in Table 4, it is observed that the coefficients of KOFG, KOFE, KOFP and KOFS variables are calculated positively and statistically significant in G-9 group countries, and the coefficients of KOFG, KOFE, KOFP and KOFS variables in G-10 group countries are observed to be positive or negative and/or statistically insignificant. These findings indicate that the increases/developments which occur in the general, economic, political and social globalization level of the developed countries in the G-9 group have a positive and statistically significant effect on economic growth as of the examination period. However, the findings reveal that the increases/developments occurring in the general, economic, political and social globalization level of the developing G-10 group countries have no effect on economic growth as of the examination period.

Finally, in the study, the long-term causal relationships between the level of globalization and the economic growth variables in the models defined on the G-9 and G-10 groups are analysed by panel causality test developed by Dumitrescu and Hurlin (DH-2012) taking CD into consideration and the results supporting the Panel AMG findings are obtained. When the findings in Table 5 presented in the appendix are examined, it is seen that there is a one-way causality relationship directed from general, economic, political and social globalization to economic growth in the G-9 group countries while it is understood that there is no causality relationship between general, economic, political and social globalization and economic growth in the G-10 group countries. (These results indicating that the probability values of the test statistics calculated under the relevant causality conditions ($Z_{N,T}^{HNC}$) are less than and more than 0.05, respectively, can be seen in Table 5 provided in the appendix).

5. Conclusion

In this study, the effects of globalization on economic growth are investigated econometrically for the period 1990-2017 in the G-20 countries, which are grouped as developed G-9 and developing G-10 countries according to their economic development levels. From this aspect, the present study aims to evaluate empirically the effect of globalization process on differentiation of long-term economic growth performance and development levels of countries in G-9 and G-10 groups. In this study, in order to determine the effects of the globalization process on the economic growth of G-9 and G-10 countries, econometric models created by extending the total production function of Cobb-Douglas are estimated within the framework of panel data analysis methodology which takes

into account the cross-sectional dependence. It is possible to summarize the results of the estimated models, which support the theoretical discussions and conform with the empirical studies in the literature, as follows:

In the study, it was found that the effects of physical-human capital accumulation and technological development level variables on economic growth were positive and statistically significant as of the examination period, in all models estimated for the countries in the G-9 and G-10 groups. These results show that in the countries in developed G-9 and developing G-10 groups, the long-term increases/developments in the physical-human capital accumulation and technological development level have a positive / statistically significant effect on the economic growth as of the examination period.

In contrast, in the study, in all estimated models, it was determined that the effects of the global, economic, political and social level of the globalization process on the economic growth of the countries in the G-9 and G-10 groups differ significantly. In this context, in all models estimated in the study, the impacts of the economic, political, and social levels on economic growth was found to be positive and statistically significant in the G-9 group countries and statistically insignificant in G-10 group countries. These results show that the increases/developments which occur in the general, economic, political and social globalization levels of the developed G-9 group countries have a positive and statistically significant effect on economic growth as of the examination period. On the other hand, the results reveal that the increases/developments which occur in the general, economic, political and social globalization level of developing G-10 group countries do not have any effect on the economic growth as of the examination period. In the study, the results regarding the long-term effects of the globalization process on the economic growth of the countries in the G-9 and G-10 groups are confirmed by the direction of the causality relationships between the variables. As a matter of fact, in the study, it was found that there is a one-way causality relationship directed from the general, economic, political and social globalization variables to the economic growth variable in the G-9 group, whereas there is no causal relationship between the variables in the G-10 group. These results reveal that while, in G-9 group countries, the changes/increases in general, economic, political and social globalization level cause changes/increases in economic growth, they do not cause changes/increases in economic growth in G-10 group countries.

All these results obtained from estimated models show that the main factors that make a difference regarding the economic growth of the countries in the developed G-9 and developing G-10 groups during the study period are the general, economic, political and social level of the globalization process. However, the results show that the globalization process is much more effective than the physical-human capital accumulation and technological development level in the differentiation of the long-term economic growth performances, in other words, the development levels of the developed G-9 and developing G-10 countries during the study period. In this context, in the developing countries of the G-10 group, policymakers need to develop and implement long-term policies to develop and strengthen the relations between economic, political and social globalization level and economic growth. In this way, it will be possible, for the developing countries in the G-10 group, to benefit more from the positive effects of economic, political and social globalization level on economic growth and welfare level and to reduce the differences between the development level of them and of the developed countries in the G-9 group, to a certain extent. Otherwise, it is possible to foresee from today that the differences between the countries in the G-9 and G-10 groups detected in terms of the effects of economic, political and social globalization on economic growth and the level of development in the study period can be similar in the near future. In addition to these, it is considered that working on various countries or groups of countries by considering differences in the level of development in future applied studies will contribute to the improvement of related literature.

E-material Formatting App Improves Screen-Reading Process and Learning Abilities

Kristine MACKARE¹,
Anita JANSONE²

*^{1,2} Liepaja University, Faculty of Sciences and Engineering
Email: kristine.mackare@gmail.com*

Abstract

Technologies use increase access to both knowledge and resources, provide flexibility to access it whenever and wherever possible. All types of distance, online and e-education give a wide range of benefits to reach a goal of providing equal education opportunities for everybody in all age groups, gender, and race. To make education equal and qualitative for persons with and without disabilities and special limitations it should be made on learner-centred design base. E-learning environment evolves, and it should become more personal design approach as it is realised that everyone needs a different education solution to meet satisfaction and high results. It is important on all levels.

Contemporary e-learning environment and materials consist of several dimensions. One of them is content such as vocabulary and syntax and content presentation such as typographic aspects. Part of them are font, font size, spacing and colours that are regulated by formatting parameters.

E-material formatting app by personalised text formatting has been developed. It consists of three level formatting approach: 1st level – general formatting, based on general parameters for e-materials, as general recommendations for everyone; 2nd level – first grade personalised formatting, based on users' three question-answer analysis as age-group, gender and existence of complains, simple personalisation; 3rd layer – second grade personalised formatting, request more detailed user information and analysis, gives deeper personalisation. App improves screen-reading abilities and comfort and learning processes. It is accomplished by more appropriate and personalized text formatting. That create and provide more effective e-materials as it increases visual perception, legibility, readability, reading comprehension, memorability of content. Learners can use e-materials longer time as screen-reading comfort is increased by adapted formatting. It is followed by improvement of individual educational results. Without comfort improvement, it is expected that near-work load and effect on vision will be reduced. As app have learning possibilities it supposes to reach great results, especially in the long term. Also, current app is designed as an adaptable app for different solutions and can be used in a wide range.

Keywords: app, contemporary e-learning environment, e-material formatting, equality of educational opportunity, personalised approach.

Introduction

Equal educational opportunities imply that educational services should be accessible to everyone respectful of their abilities and interests. (Aksu & Canturk 2015) It is important because the education significantly influences a persons' life and chances on market success. (Stanford encyclopaedia of philosophy 2017) Technologies and e-learning provides wider possibilities for everyone. To make education equal and qualitative for persons with and without disabilities and special limitations it should be made on learner-centred design base - allowing for flexibility in content according to a student's desire or need. (Gordon 2014)

All types of e-learning give huge amount of benefits to reach a goal to provide equal educational opportunities for everybody in all age groups, gender, and race. Benefits of e-learning improves the quality of learning and teaching, changes the approach of learning and teaching, better possibility of study process monitoring, provides more flexible learning, effectiveness of learning and teaching, increase the effectiveness of time, provide more learning opportunities, specific training possibilities, collaboration possibilities, and not limited with named ones. (Gaebel, et.al. 2014)

Contemporary e-learning environment is highly integrative and require not only flexibility in provided online functions, but also attributes of student-centred approach to learning. (Segrave & Holy 2003) It includes

engaging with all groups of learners taking in mind also visual, auditory and kinesthetic type of learners: Visual learners respond to images and graphics, Auditory learners prefer verbal presentations and Kinesthetic learners prefer a physical, hands-on approach. (Dawson 2014; State Government of Victoria, Australia 2016) E-learning paradigm and style can reach different learners more effectively by using appropriate technologies, environment, design. (FAO 2011) No matter how multi-faceted learning becomes with use of technology, no e-learning material or e-course can absolutely evade from including reading material. (Bates 2015)

E-materials, typographic aspects: Students must have access to a variety of high-quality digital learning materials and resources to support their learning. (US Office of educational technology 2017) Valuable and effective e-learning material must be prepared in good quality to reach educational goals. It is important to content such as vocabulary and syntax and its presentation such as typographic aspects like font, font size, spacing and colours that are regulated by formatting parameters. (Bringhurst 2005; Lynch & Horton 2016)

Unfortunately, currently there are no ambiguity in recommendations for e-materials formatting parameters.

Method

Methodology: Secondary data use of parameters, literature research, recommendation and app analysis

Findings

Literature research.

Around 15-20% of the world population has a language-based learning disability. (International Dyslexia Association 2016) Even more have complains about screen reading. Reading from a computer screen is different from printed media as reading on screen text is 25-30% slower than reading printed materials. (Ferrari & Short 2002; Nielsen 2000) Most computer users experience visual fatigue (VF) and digital eye strain (DES). Screen users can experience dry eye, eye strain, headaches, and encompasses a range of ocular and visual symptoms as blurry vision, for example. External symptoms as burning, irritation, sand feeling, tearing and dryness were noted to be closely related to dry eye, while internal symptoms of strain, ache and headache behind the eyes were linked to accommodative and/or binocular vision stress. Mostly symptoms are typically temporary, but they may be frequent and persistent. (Sheppard & Wolffsohn 2018)

There is a close connection between vision and learning as learning is accomplished through complex and interrelated processes, one of which is vision. (JOBS & AOA 1998) Good vision system not only allows to see information, but process information through visual system, which is key to the learning process. (Ajina & Bridge 2016) Approximately 80 percent of learning occurs visually - through eyes. (NCCA and Vision Institute of Canada 2014)

Visual perception is the ability to perceive and interpret surroundings through the light in the visible spectrum reflected by the objects in the environment. (Interaction Design Foundation 2018) Visual perception involves sensory-motor system, the same as memory relay. (Vermeulen, et.al. 2008) Variety of results shown that perception and memory processes seem to overlap, (Riou, et. al. 2011) and perception influences memory processes. (Van Dantzig, et.al. 2008) Physical size difference during the perception process influenced response speed as a typical size difference led to faster reaction time. (Riou, et. al. 2011)

Legibility is the ability to recognise individual letters or words. (Lund 1999) It is the quality of type that affects the perceptibility of a word, line, or paragraph of printed matter. (Harper 2010) Readability is the optimum arrangement and layout of whole bodies of text. (Lund 1999) It is the property of type that affects the ease with which printed matter can be read for a sustained period. (Harper 2010)

Recognised measures of legibility or readability:

- Comprehension - is capable of being comprehended or understood; intelligible. (Harper 2010)
- speed of reading
- speed of perception
- fatigue in reading
- backtracking and other eye movements
- perceptibility at a distance
- perceptibility in peripheral vision
- memorability of content. (DuBay 2004)

Readability is thus affected by:

- x-height: The space between baseline and x-height is crucial for reading words, especially when consisting predominantly of lowercase letters.
- Horizontal spacing:
- Word spacing

Attributes can be categorized as influencing legibility in substantial ways:

- Explicit glyphs
- x-height
- Open counters. (Neumeier 2017)

In screen reading suitable fonts has an influence on students. (Hojjati & Muniandy 2014) On screen is advised to use clear sans serif fonts. (Baeza-Yates & Rello 2013) Serifs help the readability in printed material by supporting the reading flow but do the opposite on the web. On screen serifs can make more difficult to read the text as it can easily blur together. (Bernard, et.al. 2001) Sans serif fonts that are easily readable on screen include Arial, Helvetica, Trebuchet, Lucida Sans, and Verdana. (Mackare & Jansone 2017)

Already in 1998 is noted that size of typeface must be 14 or 16-point as it is significantly easier to read than smaller type. (Harris 1998) It is scientifically proven that a larger font size for reading is more favourable but there are very few studies that have studied the letter sizes, which are above 14 pt. (Mackare & Jansone 2017)

Bigger font size positively affect memory, decision-making and reasoning of reading text. (Rhodes, et.al. 2008; Alter & Oppenheimer 2009; Yue, et.al. 2013; Pieger, et.al. 2016) There are limits for size what are making positive affect. As Rods (Rhodes, et.al. 2008) study shows, 18-point size is better than 48pt size text.

Bigger line spacing is more preferred with respondents and are shown as more readable on screens. (Hojjati & Muniandy 2014) It is relevant to school age children and adults. (Katzir, et.al. 2013; Vered, et.al.2018) The reading speed and accuracy is affected by text size and spacing between lines. Comprehension is mostly affected by small font size. By decreasing font size affect reading rate and accuracy negatively in young children, same as comprehension (Katzir, et.al. 2013) and reading fluency. (Primor, et.al. 2011) Eyestrain decrees by using larger text size as 20pt and 28pt comparing to 12pt size and increase users satisfaction. 20pt size was a significant preferable to small texts. (Russell & Chaparro 2001) Increasing the minimum recommended print size from to 14 or 16 points would significantly increase ability to read fluently. (Rubin, et.al. 2006) Fixation duration analysis shown that 22pt size text and spacing 1.5 increase readability but comprehension score is higher by 18pt size and spacing 1.8. Subjective readability ratings increased by 18pt. (Rello, et.al. 2016) For people who were diagnosed dyslexia font size could be increased until 28pt. (Rello, et.al. 2013) In results, shorter reading durations are preferred more than longer ones as faster reading is related to more readable texts. (Williams, et.al. 2003)

As conclusion, font text size should be at least 14pt and have positive affect by increasing until 22pt size.

In theory and big part of research colours with greater contrast ratio in general lead to greater readability. (Hall & Hanna 2004) Optimal legibility requires black text on white coloured background. It is so-called positive text. Legibility suffers a lot from any other colour that make the text any lighter than pure black and decrease contrast. (Nielsen 2000) By testing other colour combinations results showed that the higher the luminance contrast was, the better was reading performance. (Shieh & Lin 2000) Luminance is like a brightness of a colour. (Hall & Hanna 2004)

Similarly, was found that combinations with positive polarity resulted in better performance. It is dark text on light background. It supports previous hypothesis and researches that as greater is the contrast between colour combinations as better is the performance. (Wang, et.al. 2003) For finding and searching tasks, performance was better for green text on the yellow background despite that one of the test combinations was used most preferable black on white. (Clarke 2002)

There is the fact that all parameters of colours and colours by themselves (as final tone people percept) on the screen and web cannot be well controlled, as they vary with the users browser and computer system. (Hall & Hanna 2004) In addition, the study found that the colour effect was often affected by other factors, such as font type. (Clarke 2002) In Hill and Scharff (1997) research three different background colours (light grey, dark grey, and white) with a black test were used. Surprisingly, they found better performance with the grey backgrounds than with the white background. (Hill & Scharff 1997) There are found a strong positive relationship between saturation (i.e., a colour's 'vividness') and arousal, while they controlled carefully for saturation in comparing colours (hues). (Valdez & Mehrabian 1995)

Different parameters of colour should be taken in consideration, to find best combination for education reasons- There are differences between purpose and types of content: educational and commercial, and what parameters should be used. It is a balance between all functional factors and aesthetic. And formatting parameters should be evaluated in combination of each other.

New development.

As there are is unambiguity of all parameters of text formatting and no developed clear recommendations for e-material formatting when there is a need of new developments for improvements and solution. (Mackare & Jansone 2017; Mackare & Jansone 2018)

Based on a wide literature research and users' preferences e-material formatting recommendations for 4 mine parameters are created for 9 age groups of users. Full age range is chosen as most active e-material use time for educational reasons and age groups are chosen based on vision and brain development and including natural age-related changes. Most age group have two alternatives possible formatting what can bring to the same improvements.

Recommendations are compromise solution from literature research background as suggested for screen reading because of improvements and users' preference survey research. Wider version of recommendations is developed and presented at table 1. This table contain recommendations for regular users without disabilities and specific limitations.

Table 1. General formatting recommendations for e-material body text parameters

Age group	Font	Font size	Space between lines	Text and background colours
3-5g	Verdana*	14pt*	2*	Black on white*
6-12g	Verdana	12pt	2	Black on white
	Arial	14pt	1,5	Grey on white
12-15g	Georgia	16pt	1,15	Black on white
	TNR	14pt	1,5	Grey on white
16-25g	Verdana	12pt	1,15	Black on white
	Arial	12pt	1,15	Grey on white
26-35g	Verdana	12pt	1,5	Black on white
	Arial	14pt	1,15	Grey on white
36-39g	Verdana	14pt	1,5	Black on white
	Arial	14pt	1,5	Grey on white
40-55g	Verdana	14pt	1,5	Black on white
	Arial	14pt	1,5	
55+g	Verdana	14pt	1,5	Black on white
	Arial	16pt	1,5	
65+g	Verdana	16pt	1,5	Black on white
	Arial	16pt	2	

Main idea of app is to help automatically (easy and fast) make more appropriate formatting of e-material for each user based on developed recommendations and make them more personalised and more effective by app learning process.

Currently it is three level formatting app prototype that is developed with tree level e-material formatting and personalization approach:

- 1st level – general formatting. It is based on developed methodology for e-materials as general parameters recommendations made by users age groups that are appropriate for everyone on computer screen;
- 2nd level – the first-grade personalised formatting. It is based on recommendations what are made based on users' three question-answer analysis as age-group, gender and existence of complains. It is simple personalisation. This is personalized formatting without detailed and more personalized suggestions. Application analyses data based on existing decision-tree scheme and generate propriety formatting style;
- 3rd level – the second-grade personalised formatting. It is based on extended users' information. That why on one hand, it requests more detailed user information and analysis of it. On the other hand, it gives more user-centric formatting possibilities and can provide higher comfort for user and better screen work improvement. Also, on this level application analyses data by existing decision-tree scheme and generate propriety formatting style.

In future, it is hoped to add 4th level as the third-grade personalised formatting with very intensive personalization what app learns to make from all data over time.

Results, Conclusions and Recommendations

Based on literature research and previous data, it is possible to make conclusions what improvement of primary parameters used for e-material formatting as font type, size, spacing and colours can meet improvements of screen-reading process and learning abilities by each e-material formatting level in app. As often it is shown, small is a big. An improvement of small part of all e-learning system can provide big change and improvement in all learning process.

App 1st level formatting gives primary comfort for computer screen users by using e-materials as text size is more appropriate to percept from computer screen on regular computer using distance. Decrease visual fatigue (VF) and digital eye strain (DES). Improves user's legibility and readability.

App 2nd level in addition of 1st level formatting improvements, increase perception abilities and reading speed. Improve learning and memory abilities.

App 3rd level in addition decrease personal complains and increase reading and learning abilities. As it is more personalised, it will decrease VF and DES even more and it can be believed what near work load consequences as accommodation system overload and myopia progress can be decreased.

In future, app 4th level as more personalised, will give even more benefits on all features. And by personalisation improvements in screen reading will reach as much people as users are.

All recommendations are based on literature research and previous studies. Next part of work is to approve benefits experimentally by users. As all previous studies are based on research and benefit of 1 or 2 parameters it is quite challenging to make complex evaluation but very necessary step.

The Role of Tax in Sustainable Growth

Nigar GULIYEVA¹

Abstract

Public expenditures are the expenditures made by the state to sustain its existence. Public spending has an important role to play in infrastructure investments and public goods and services. Public spending in a country's development is inevitable. In literature studies, it is seen that there is a relationship between the developed level of a country and the development of the tax system of that country. Implementation of a good tax system and determination of tax rates are important for taxpayers. The taxpayers' knowledge about the taxes they will pay shows their tax awareness. It is very important for a society to ensure that people who form a society are constantly informed about the taxes in their communities and that the collected taxes constitute the main source of public spending.

The purpose of our study is to measure whether taxes and public expenditures have an impact on the growth of the state's GDP. The hypothesis is that the increase in taxes and public expenditures will increase the GDP.

Introduction

Public expenditures and taxes constitute an intertwined composition. As a matter of fact, the state needs a source of financing in order to make public expenditures. The most important financing requirement of the state is tax. Taxes are unpaid and forced by the state, depending on the economic power of individuals are economic values. Excessive taxes affect the government spending more on public expenditures. The increase in public expenditures leads to the opening of new workplaces, the increase in employment, the increase in employment in the income of more people, this increases the purchasing power of people, the increase in purchasing power and increase in demand, this also increases the increase in production. All these developments increase the state's GDP. The expected result from this fall is the increase in taxes and the increase in public expenditures.

The data used in the study were obtained from the Azerbaijan Statistical Committee. The data after Azerbaijan gained independence from the region were used in our study. A total of 27 years of data covering the years 1992-2018 was used in our application.

Method

In this study, after the independence of the Republic of Azerbaijan again, the relationship of annual GDP with public expenditures and taxes is measured. Annual data were used to form the data set. The data set covers the years 1992-2018 and consists of a total of 27 observations. Data were obtained from Azerbaijan State Statistics Committee. The independent variable of the econometric model is public expenditures and taxes. In our study, the dependent variable was the GDP. After the cointegration test between variables, long and short term relationships were analyzed and interpreted. The Johansen Cointegration causality test was used to distinguish between causality among variables.

The data types used in time series models are generally not static. One of the important points to consider when a series is examined is whether the data is stationary or not. Empirical studies are made stationary by applying unit

root test to non-stationary time series. In general, the most commonly used unit root tests in these studies are Augmented Dickey Fuller (ADF), Philips-Perron and Dickey Fuller tests (Yurdakul, 2000, p.23). In addition, extended Dickey-Fuller (1981) and Phillips-Perron (1988) unit root tests are used to investigate stationarity. In our study, the series were stabilized by using Augmented Dickey Fuller and Philips-Perron tests.

Findings

The purpose of our study is to measure whether taxes and public expenditures have an impact on the growth of the state's GDP. The hypothesis is that the increase in taxes and public expenditures will increase the GDP. Public expenditures and taxes constitute an intertwined composition. As a matter of fact, the state needs a source of financing in order to make public expenditures. The most important financing requirement of the state is tax. Taxes are unpaid and forced by the state, depending on the economic power of individuals are economic values. Excessive taxes affect the government spending more on public expenditures.

The data used in the study were obtained from the Azerbaijan Statistical Committee. The data after Azerbaijan gained independence from the region were used in our study.

In this study, after the independence of the Republic of Azerbaijan again, the relationship of annual GDP with public expenditures and taxes is measured. Annual data were used to form the data set. The data set covers the years 1992-2018 and consists of a total of 27 observations. Data were obtained from Azerbaijan State Statistics Committee. The independent variable of the econometric model is public expenditures and taxes. In our study, the dependent variable was the GDP. After the cointegration test between variables, long and short term relationships were analyzed and interpreted. The Johansen Cointegration causality test was used to distinguish between causality among variables.

The tables below include the annual movements of GDP, Public Expenditure and the State Tax. It is possible to interpret the data according to the mobility in the table. Below is the graphic of each series.

There is an increasing value in the GDP series. In the other series, Expenditures and Taxes, there is an increasing trend over the years. The reason for this increase is the development of the state and consequently the increase in GDP and public expenditures. The reason for the increasing trend in taxes is that taxes are the most important financial source of the state. In other words, as long as public expenditures increase, so do taxes.

A series of tests should be used to measure whether the series are stationary, or to what degree they are stationary. Variables were included in the model by taking logarithms while analyzing. It is seen that our series have an increasing trend which is not stationary.

The data types used in time series models are generally not static. One of the important points to consider when a series is examined is whether the data is stationary or not. Empirical studies are made stationary by applying unit root test to non-stationary time series.

The tables below include the annual movements of GDP, Public Expenditure and the State Tax. It is possible to interpret the data according to the mobility in the table. Below is the graphic of each series:

GDP:

Spending:

Tax:				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
LOGGSYIH(-1)	-0.130400	0.048531	-2.686915	0.0135
D(LOGGSYIH(-1))	0.439893	0.138803	3.169190	0.0044
C	1.350390	0.492481	2.742016	0.0119

Variable	Coefficient	Std. Error	t-Statistic	Prob.
LOGGSYIH(-1)	-0.130400	0.048531	-2.686915	0.0135
D(LOGGSYIH(-1))	0.439893	0.138803	3.169190	0.0044
C	1.350390	0.492481	2.742016	0.0119

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-2.686627	NA	0.000316	0.454930	0.601195	0.495498
1	81.37877	141.2299	7.87e-07	-5.550302	-4.965241	-5.388031
2	96.73184	22.10842*	4.91e-07*	-6.058547*	-5.034692*	-5.774573*

There is an increasing value in the GDP series. In the other series, Expenditures and Taxes, there is an increasing trend over the years. The reason for this increase is the development of the state and consequently the increase in GDP and public expenditures. The reason for the increasing trend in taxes is that taxes are the most important financial source of the state. In other words, as long as public expenditures increase, so do taxes. A series of tests should be used to measure whether the series are stationary, or to what degree they are stationary. Variables were included in the model by taking logarithms while analyzing. It is seen that our series have an increasing trend which is not stationary.

Results, Conclusions and Recommendations

The aim of this study is to measure whether taxes and public expenditures have an impact on the growth of GDP. The hypothesis was that the increase in taxes and public expenditures would increase the GDP.

The data used in the study were obtained from Azerbaijan Statistical Committee. The data after Azerbaijan regained its independence were used in our study. A total of 27 years of data covering the period 1992-2018 was used in our analysis.

As a result of the study, an increasing value is seen in the GDP series. It is concluded that there is an increasing trend in other series, Expenditures and Taxes. The reason for this increase is the development of the state and the increase in GDP and public expenditures due to this development. The reason for the increasing trend in taxes is that taxes are the most important financial source of the state. In other words, as long as public expenditures increase, so does taxes.

In the present study, a series of tests were required to measure whether the series were stationary, or to what degree they were stationary. Variables were included in the model by taking logarithms while analyzing. As a result of the tests and analyzes, it is seen that our series have an increasing trend which is not stationary. In other words, an increase has been observed in all three values over the years. Another reason why it has an increasing trend is that Azerbaijan is among the developing countries. As a matter of fact, public spending is higher in developing countries. Excess public spending means that tax revenues are high.

Abstract

The Czech Republic has a long tradition of protecting against weapons of mass destruction. It still works for the deepening and greater efficiency of processes and mechanisms of disarmament, arms control and non-proliferation of weapons of mass destruction and their means of delivery. It develops capabilities for its defence against the threat of chemical, biological, radiological and nuclear weapons of mass destruction. As part of the sharing of common risks and responsibilities within NATO, it continues to develop its armed forces' specialization in protection against weapons of mass destruction. Attention is also paid to the development of capabilities necessary for the effective protection of civilians, critical infrastructure and consequence management in humanitarian crisis and natural disasters. The article deals with selected international treaties, current agreements and international cooperation initiatives in the field of non-proliferation of nuclear and chemical weapons, in which the Czech Republic is represented through specific bodies or ministries. There is also a general description of the view and the specific military approach. The involvement of the Czech Ministry of Defence and the Czech Armed Forces in NATO structures enables to influence the strategic decision-making in the area of CBRN and thus support the current trends concerning forensic analysis, sampling of CBRN samples and response to new trends in the field of WMD elimination. For this purpose, they serve as a guarantor of maintaining the ability of conceptual, normative and educational activities for capabilities of the Czech Armed Forces, the NBC Defence Institute, University of Defence, and the JCBRN Defence COE.

Keywords: Non - proliferation of WMD; international cooperation; disarmament; disablement; control mechanism.

Introduction

„The Czech Republic works for the deepening and greater efficiency of processes and mechanisms of disarmament, arms control and non-proliferation of weapons of mass destruction and their means of delivery. In response to the adoption of the new NATO Strategic Concept and measures aimed to strengthen Article 5 of the Washington Treaty, the Czech Republic actively supports the development of NATO territorial missile defence and considers the options for its own involvement in this system. It develops capabilities for its defence against the threat of chemical, biological, radiological and nuclear weapons of mass destruction. As part of the sharing of common risks and responsibilities within NATO, it continues to develop its armed forces' specialization in protection against weapons of mass destruction“ (Security Strategy of the Czech Republic, 2015, para 60).

From the perspective of the international community, the issue of WMD non-proliferation is seen as one of the important areas needed to secure economic prosperity and political stability in a global context. Since its inception, the United Nations has considered arms constraints and versatile disarmament to be a key prerequisite for the preservation of peace and security in the world. Accession and enforcement of conventions and initiatives in this area have led to a reduction in tensions during the bipolar world and have contributed to the end of the Cold War. A slight reduction in tension in the 1990s was replaced by a re-emergence of security risks in the WMD proliferation. For example, the issue of short and medium range WMD missile launchers - the Intermediate-Range Nuclear Forces Treaty, concluded in 1987 between the US and the former Soviet Union, which can significantly change the power distribution of the forces and stability of the security environment. The suspension of the contract is very likely to result in the re-deployment of those missile launchers in the European

area and the means to eliminate them (Sektorová analýza, UoD, 2019). The Czech Republic has implemented international conventions and agreements and implemented treaties into national laws and regulations that provide the legal framework for the control and management of this hazardous material.

Method

The following methods of scientific research were used to achieve the research objective - content analysis of documents and texts, which included the studies of themes proliferation of nuclear and chemical weapons. The method of induction and deduction was used to formulate recommendations for practice in the Czech Armed Forces, in order to deduce and generalize recommendations and conclusions.

Findings

Nuclear weapons

They are combat devices using nuclear or thermonuclear reactions. A distinction is made between nuclear weapons with reduced levels of radioactivity and nuclear weapons with increased radioactivity (Názvoslovná norma, 2009). They are "real" weapons of mass destruction, a combination of great destructive power in the explosion itself and the subsequent radioactive contamination of the area, the electromagnetic pulse, and the pressure wave. The table 1 lists the 2018 nuclear weapons as published in SIPRI's regular annual report (SIPRI Yearbook 2018). All figures are approximate. The estimates presented here are based on public information and contain some uncertainties.

Table 1. World nuclear forces, January 2018

Country	Year of first nuclear test	Deployed warheads	Stored warheads	Other warheads	Total inventory
United States	1945	1 750	2 050	2 650	6 450
Russia	1949	1 600	2 750	2 500	6 850
United Kingdom	1952	120	95	–	215
France	1960	280	10	10	300
China	1964	–	280	–	280
India	1974	–	130–140	..	130–140
Pakistan	1998	–	140–150	..	140–150
Israel	..	–	80	..	80
North Korea	2006	–	..	(10–20)*	(10–20)*
Total		3 750	5 555	5 160	14 465

* there is no authoritative open-source evidence to confirm that North Korea has produced or deployed operational nuclear warheads.

..= not applicable or not available; - = zero; () = uncertain figure.

Chemical weapons

It is chemical ammunition or special equipment filled with chemical warfare agents or their precursors,¹ which can be used as a means of conducting combat operations due to their toxic properties and the amount used.

Chemical weapons include:

- Ammunition and other means of killing or causing harm to human or animal health, damage to plants or ecosystems when these effects result from the toxic properties of the toxic chemicals released from them

¹ A compound that participates in a chemical reaction that produces another compound.

- Any equipment specifically designed to use the said ammunition and other means (Názvoslovná norma, 2009).

There are many kinds of chemical weapons, as well as a number of ways and means to hit a target - by spraying, using a weather situation (wind, rain), but the most commonly used chemical ammunition. An example of use is a rocket (a missile such as a Scud) that carries a warhead with a chemical charge. Due to the great development of the chemical industry, a large number of substances have been developed that can be used militarily. According to OPCW's annual documents, stocks of these substances are disposed of in accordance with pre-established agreements. Table 2 gives an overview of the fulfillment of these commitments (OPCW. OPCW by the Numbers, on line).

Table 2. Chemical Weapons Disposal Overview, November 2018.

States that have declared chemical weapons	8 (Albania, India, Iraq, Libya, Russia, Syria, the United States and another State Party)
States that have completed destruction of declared chemical weapons	6 (Albania, India, Libya, Russia, Syria and another State Party)
World's declared stockpile of chemical agent that has been verifiably destroyed	96.99% or 70,128 metric tonnes from 72,304 metric tonnes
States that have declared chemical weapon production facilities	14 (Bosnia and Herzegovina, China, France, India, Iran, Iraq, Japan, Libya, Russia, Serbia, Syria, the United Kingdom, the United States of America and another State Party).
Chemical Weapons Production Facilities	Declared - 97 Destroyed – 74 Converted for peaceful purpose - 23

Proliferation

Proliferation is characterized as the spread of weapons of mass destruction, their carriers and internationally controlled items. The term “proliferation”, or more appropriately “non-proliferation”, refers to monitoring and disrupting activities aimed at obtaining strategic materials, devices, individual components, technologies and know-how that may be used for the development and production of WMDs (nuclear, chemical and biological), including their carriers (Security information service, online).

International approach to CBRN proliferation

It is an indisputable and often mentioned fact that the proliferation of WMD and their means of delivery is the greatest global security threat, especially in the context of increasing international terrorism, both group and individual. There is a general consensus within the international community on this issue, yet there are two main ideas of the cooperative security approach supported by the UN and the proliferative counterparts (non-proliferation) advocated mainly by the US administration.

Cooperative security approach

The principle is based on the legal regime, along with binding multilateral agreements and verification mechanisms is considered the best way to peace and stability. Stability and predictability in international relations is the primary goal of a sovereign state. The cooperative school of thinking is based on the fact that states and non-state actors can strive for WMD for the sake of prestige and status in order to put the world in the face of the fact that they now have to deal with these actors (North Korea, Iran). At the same time, he acknowledges that efforts to obtain WMD can result in illegal armaments. Despite this fact, the supporters of this

strategy are convinced that states will seek greater relative security through mutual commitments to limit their military capabilities.

Counter-proliferation strategy

This idea was first formulated by former US Secretary of Defence Les Aspin. Originally, this approach has been described as complementary to initiatives based on global non-proliferative regimes. However, at present, the concept of non-proliferation has almost exclusively focused on the proliferation policy line based on the general conclusion that control arms and disarmament regimes do little to contribute to international peace and security. The counter-proliferation strategy is based on selective US multilateralism, their friends and allies will flexibly use a mix of supplier export controls, deterrence, coercive diplomacy of global military superiority and preventive or pre-emptive use of military force.

There is also an opinion on the variant of the third concept, or the strategy of the middle way between cooperative and contra proliferation strategy. However, no such concept has yet been defined in such a way as to allow its comparative analysis to be carried out (Tůma, Nešříření ZHN v kontextu aktuálních otázek, Brno, 2004).

NATO approach to CBRN proliferation

The Czech Republic is the NATO member since 1999. NATO's fundamental mission is to protect the freedom and security of all its members by political and military means, in accordance with the principles of the UN Charter. To achieve this, the Alliance also deals with WMD non-proliferation. This issue is embedded in the strategic concept of 2010 - Strategic Concept for the Defence and Security of the Members of the North Atlantic Treaty Organization (NATO, Strategic Concept, 2010).

This document defines non-proliferation as follows: Armaments control, disarmament and non-proliferation contribute to peace, security and stability and should ensure security for all Alliance members. We will continue to play a role in strengthening arms control and in promoting the disarmament of both conventional weapons and weapons of mass destruction, as well as efforts to non-proliferation. The Alliance will continue to explore ways in which political means and military capabilities will contribute to international efforts to combat proliferation, including WMD.

A key document in this area is NATO's Comprehensive strategic policy for preventing the spread of weapons of mass destruction and defence from chemical, biological, radiological and nuclear (CBRN) threats. The idea is that NATO, with due respect for the Alliance's main military mission will actively seek to prevent the proliferation of weapons of mass destruction by state and non-state actors. Protect the Alliance in case this effort fails and be prepared for the renewal of the territory affected by the WMD or CBRN incident within its competence. Bringing added value through a comprehensive political, military and civilian approach, by supporting the development of Allies' capabilities to prevent or stop WMD trade, related materials and their means of delivery. These capabilities could be used in maritime operations aimed at limiting trade in these materials. In addition, the Alliance could bring its military capabilities into the process of detecting, identifying, tracking, acquisition or WMD development.

Conduct information operations to exclude, deter and refuse the proliferation of WMD. Launch intelligence exchange between allies and, where appropriate, partners, to produce information reports for WMD non-proliferation activities. The Alliance can also develop and support common operational standards, concepts, doctrines and tactics, as well as promote or facilitate relevant training and exercises in this area. Finally, NATO will strengthen its international reach to support the partners' related capabilities and strengthen the global response to potential WMD proliferation (NATO. NATO's Comprehensive, Strategic-Level Policy, 2009).

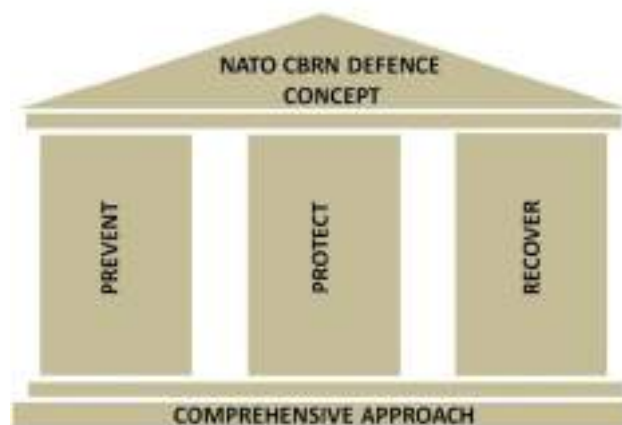

From the military point of view, the issue of non-proliferation of WMD is seen as a political area, and the Alliance is more inclined to the concept of preventing the proliferation of WMD. A new approach in this area was presented in 2018 - Weapons of Mass Destruction Disablement Functional Concept. This concept introduces a systematic and comprehensive approach to preventing the proliferation of weapons of mass destruction and defending against CBRN threats. WMD disablement is defined as operations aimed at systematically locating, securing, removing or destroying WMD, chemical weapons, CBRN equipment and material, or for research, development, testing, production and storage, including weapons, equipment of potential opponents.

The Comprehensive CBRN Defence Concept combines the required areas for CBRN protection, as well as relevant tasks associated with the three pillars of prevention, protection and recovery (Table 3) and further defines the capabilities needed to accomplish these tasks. It serves to assess how NATO can better combat WMD proliferation and dissemination, review current CBRN security protection requirements, including political input, and identify areas of progress and weaknesses.

Recognizes that NATO's defence planning process is an important mechanism by which NATO identifies capacity gaps and ensures that the Alliance can respond effectively to threats. Operational capabilities to discourage, detect, disrupt and prevent the proliferation of WMD and respond to CBRN crisis situations can make it difficult to spread WMD and improve NATO's attitude to effective response. The assessment contains practical recommendations that can be applied in order to address weaknesses in each of these areas (NATO. Lisbon Summit Declaration, 2010).

NATO's comprehensive CBRN protection concept creates a link between political-strategic level and tactical skill development. Last but not least, it will help to unify knowledge in the fields of doctrine, organization, training, material, standards and operations. The importance of this issue is also evidenced by the establishment of a new NATO Smart Defence project - MCDC Project countering weapons of mass destruction (CWMD). The project seeks to national develop a guide for multinational, multi-organizational cooperation toward reducing the threat from weapons of mass destruction (NATO. Status Report Smart Defence Projects and Proposals, Rev. 92, 2019).

Table 3. Comprehensive CBRN concept

While in the past the main aim of NATO's efforts to combat CBRN threats has been to focus on military forces and adversary assets, the current possible abuse of CBRN material and WMD terrorists, as well as CBRN events caused by industrial or natural disasters affecting the civilian population more intensively, today and in the future more makes it more vulnerable.

Vulnerability and risk analysis is needed to mitigate risks, showing weaknesses in the system and plans for adequate civilian response and providing possible military support to civilian authorities. The demands for civil-military cooperation have increased significantly.

Joint civil-military training and exercise strengthen relationships and collaboration in consequences and CBRN protection. Its level, scope and depth must be considered for each organization, at each stage of the operation, and at all levels of command. The mechanisms for deploying NATO's joint civil-military units, consolidating and planning civilian and military capabilities, including media operations, should be explored and trained (NATO, Strategic Concept, 2010).

To provide CBRN evidence, NATO expects to use a specialized chemical unit called the CBRN Multirole Exploitation and Reconnaissance Team (Zahradníček, Otfisal, Příspěvek chemického vojska k naplnění schopnosti sběru důkazů a forenziky, Vojenské rozhledy, 2016).

Czech Armed Forces and CBRN proliferation

At the Czech Armed Forces (CAF) and General Staff of the CAF the issue of non-proliferation of WMD is dealt with by the Czech Ministry of Defence (MoD) Force Development Division, Land Forces Department, specifically the chemical troops detachment. Especially by enforcing CBRN protection capability commitments, by implementing NATO standards for CBRN Defence and by joining NATO's CBRN doctrines. The involvement of the Czech Armed Forces in the Framework Nations Concept (FNC) process ensures the readiness of chemical units to extend their scope to the area of non-proliferation of WMD (Havel, Novotný, Možnosti rezortu obrany při prosazování FNC, Vojenské rozhledy, 2016).

The CAF has built and operates the Army Monitoring Network (ARMS), which is part of the state monitoring network. This network provides permanent control of the radiation situation in the Czech Republic. It is operated by the State Office for Nuclear Security (SÚJB). In co-operation with the SÚJB, the CAF conducts air monitoring service over the territory of the Czech Republic. By using this network and aerial monitoring, it is possible to monitor the possible movement of radioactive material in the Czech Republic.

Efforts to reduce nuclear weapons, ban on chemical and biological weapons and eliminate them lead to a stabilization of the security environment not only in Europe but also worldwide. The following findings and conclusions can be formulated from the analysis of the Czech Republic's involvement in WMD proliferation and from the results of the general staff course final work (FOKT, Nástroje bezpečnostní politiky k zamezení proliferace ZHN, 2019).

- The Czech Republic has fully fulfilled all the existing conventions in the field of non-proliferation of WMD and their carriers.
- The Czech Republic and the MoD participate in the promotion of WMD non-proliferation policy and participate as a member of the international community in all relevant arms control, disarmament and non-proliferation regimes.
- The main task for the MoD is primarily to ensure protection against the impacts of weapons of mass destruction, both in favor of its own and allied forces and as part of the integrated rescue system also for the benefit of the civilian population.
- Involvement of the MoD and the CAF in the process of non-proliferation is possible in the field of intelligence - INTEL support, development of capabilities according to NATO standards in the field of CBRN protection and involvement of CAF members in OPCW expert teams.

- The concept of non-proliferation of WMD has been approved within NATO. The task for the MoD and the CAF is its implementation into standards and regulations, including the modification of standards for chemical troops.
- Inter-ministerial cooperation on WMD non-proliferation is considered sufficient and good. Cooperation between state organizations such as SÚJB and MoD (CAF) is beginning to develop.
- Experience with the involvement of the CAF and the MoD in non-proliferation initiatives of WMD is perceived positively and reduces security threats and risks for the Czech Republic, leading to greater transparency and strengthening of trust. It is primarily a political-strategic level. At the operational-tactical level, involvement is only in the area of information and experience exchange.
- For the CAF, it is essential to maintain the knowledge and ability to protect against WMD impacts. By preparing commanders and staffs to implement information management in the planning process, demonstrating the functional capabilities of CBRN protection, ensure the ability of the CAF to allocate forces and resources to the NRF (within CJ CBRND TF, VJTF).
- Continue building mutual cooperation in the area of CBRN with other members of the Alliance using COE CBRN in Vyškov and the CBRN Department of the University of Defence, Brno.
